To renew this book copy the call No. and give to the librarian.

CORNELL UNIVERSITY LIBRARY

HOME USE RULES.

All Books subject to Recall.

Books not used for instruction or research are returnable within 4 weeks.

Volumes of periodicals and of pamphlets are held in the library as much as possible. For special purposes they are given out for a limited time.

Borrowers should not use their library privileges for the benefit of other persons.

Books not needed during recess periods should be returned to the library, or arrangements made for their return during borrower's absence, if wanted.

Books needed by more than one person are held on the reserve list.

Books of special value and gift books, when the giver wishes it, are not allowed to circulate.

Readers are asked to report all cases of books marked or mutilated.

Do not deface books by marks and writing.

THE EDITORS

SIR DONALD MACKENZIE WALLACE,
K.C.I.E., K.C.V.O.

ARTHUR T. HADLEY, PH.D., LL.D.,
PRESIDENT OF YALE.

HUGH CHISHOLM, B.A.
(FORMERLY SCHOLAR OF C.C.C. OXFORD)

THE DEPARTMENTAL EDITORS

FOR LAW AND GOVERNMENT:

THE HON. SIR JOHN SCOTT, K.C.M.G.,
Deputy Judge-Advocate-General.

FOR MILITARY AFFAIRS:

SIR GEORGE SYDENHAM CLARKE, K.C.M.G.,
F.R.S.

FOR MEDICAL SCIENCE:

D. NOEL PATON, M.D., B.SC., F.R.C.P.ED.

FOR THEOLOGY:

REV. W. E. COLLINS, M.A., Prof. of Eccle-
siastical Hist. at King's Coll., Lond.

FOR MINING:

HENRY M. HOWE, A.M., Prof. of Metal-
lurgy at Columbia University.

FOR BOTANY:

D. H. SCOTT, M.A., PH.D., F.R.S., Hon.
Keeper, Jodrell Laboratory, Kew.

FOR GEOGRAPHY AND STATIS-
TICS:

J. SCOTT KELTIE, F.S.S., F.S.A.SCOT.,
LL.D., Sec. Roy. Geog. Soc.

FOR ASTRONOMY:

SIMON NEWCOMB, PH.D., LL.D.

FOR MATHEMATICS:

JOSEPH LARMOR, M.A., D.SC., SEC.R.S.,
University Lecturer in Mathematics,
Cambridge.

FOR ELECTRICITY:

J. A. FLEMING, M.A., D.SC., F.R.S., Prof.
of Electrical Engineering, Univ. Coll.,
London.

FOR ART:

M. H. SPIELMANN, Editor of the *Maga-
zine of Art*.

FOR ZOOLOGY:

G. HERBERT FOWLER, PH.D.

FOR NAVAL AFFAIRS:

JAS. RICHARD THURSFIELD, M.A.

FOR BIOGRAPHY:

RICHARD GARNETT, C.B., LL.D.

FOR LITERATURE:

EDMUND GOSSE, LL.D.

FOR ECONOMICS:

WYNNARD HOOPER, M.A.

FOR RAILWAYS:

MAJOR HENRY G. PROUT, Editor of
Railroad Gazette, N.Y.

FOR MUSIC:

J. A. FULLER MAITLAND, M.A., F.S.A.

FOR GAMES AND SPORTS:

ALFRED WATSON, Editor of the *Admin-
ton Library*.

THE ASSOCIATE EDITORS

PHILIP A. ASHWORTH, DR. JUR.
H. M. ROSS, B.A.

FRANKLIN H. HOOPER, A.B.
E. H. WILLIAMS, M.D.

THE SUB-EDITORS

JAMES A. MANSON.

ENCYCLOPÆDIA BRITANNICA

VOLUME XXX. (KABADIAN—MORVI.)

PRINCIPAL CONTENTS.

PREFATORY ESSAY: MODERN CONDITIONS OF LITERARY PRODUCTION.

AUGUSTINE BIRRELL, K.C.

- KAFIRISTAN.** Sir GEORGE SCOTT ROBERTSON, K.C.S.I., D.C.L., Author of "The Kafirs of the Hindu Kush."
- KANSAS.** F. H. SNOW, LL.D., Chancellor of the University of Kansas.
- KASHMIR.** Sir T. H. HOLDICH, K.C.I.E.
- KITES, MILITARY.** Major BADEN F. S. BADEN-POWELL, late President Aeronautical Society.
- KOREA.** Mrs ISABELLA L. BISHOP, F.R.G.S., Author of "Korea and her Neighbours."
- KOSSUTH, LOUIS.** J. W. HEADLAM, M.A., sometime Fellow of King's College, Cambridge.
- KUEN-LUN.** Prince KROPOTKIN.
- LABOUR LEGISLATION.** Miss A. M. ANDERSON, Principal Lady Inspector of Factories, Home Office; *United States*, Hon. CARROLL D. WRIGHT, Ph.D., LL.D., U.S. Commissioner of Labour.
- LACE.** ALAN S. COLE, Author of "Ancient Needle Point and Pillow Lace."
- LAGOS.** Sir WILLIAM MACGREGOR, K.C.M.G., M.D., Governor of Lagos.
- LANDLORD AND TENANT.** A. WOOD RENTON, Puisne Judge of Mauritius.
- LAND REGISTRATION.** C. FORTESCUE BRICKDALE, Author of "Registration of Deeds in the County of Middlesex," "Registration of Title to Land," &c.
- LAW.** Lord DAVEY, F.R.S., Lord of Appeal in Ordinary; *United States*, Hon. SIMON E. BALDWIN, LL.D., Judge of the Supreme Court of Errors, Connecticut.
- LEAD.** HEINRICH O. HOFMAN, Ph.D., Professor of Metallurgy, Massachusetts Institute of Technology.
- LEECH.** F. E. BEDDARD, F.R.S., Prosecutor of the Zoological Society.
- LEIGHTON.** COSMO MONKHOUSE (the late), Author of "British Contemporary Artists," "The Italian Pre-Raphaelites," &c.
- LESSEPS, DE.** M. DE BLOWITZ, Correspondent of "The Times" in Paris.
- LIBRARIES.** H. R. TEDDER, F.S.A., Librarian of the Athenæum Club; *United States*, Hon. HERBERT PUTNAM, Litt.D., Librarian of Congress, U.S.A.
- LIEN.** His Honour Judge FRANCIS WILLIAM RAIKES, LL.D., K.C.
- LIFE-BOAT.** CHARLES DIBDIN, F.R.G.S., Secretary of the Royal National Lifeboat Institution.
- LIGHT.** C. G. KNOTT, D.Sc., Lecturer on Applied Mathematics, Edinburgh University.
- LIGHTFOOT, BISHOP.** The Rev. CHANCELLOR J. J. LIAS.
- LIGHTHOUSES.** W. T. DOUGLASS, M.Inst.C.E., Builder of the new Eddystone Lighthouse and the Bishop Rock Lighthouse.
- LIMNOLOGY.** H. R. MILL, D.Sc., F.R.G.S., Librarian of the Royal Geographical Society, 1892-1900.
- LIQUID GASES.** JAMES DEWAR, F.R.S., Fullerian Professor of Chemistry, Royal Institution, London; President of the British Association for 1902.
- LIQUOR LAWS.** JOHN KOREN, Author of "Economic Aspects of the Liquor Problem," &c.
- LISZT.** EDWARD DANNREUTHER, Professor at the Royal College of Music; Author of "Musical Ornamentation," "Critical Edition of Liszt's Études," &c.
- LIVERPOOL.** W. F. IRVINE, Honorary Secretary, Record Society of Lancashire and Cheshire.
- LOCAL GOVERNMENT, &c.** ALEXANDER MACMORRAN, K.C., Author of various works on Local Government.
- LOG.** Captain J. WHITLEY DIXON, R.N., Author of "Mariner's Compass in an Iron Ship."
- LOGIC.** THOMAS CASE, M.A., Professor of Moral and Metaphysical Philosophy, Oxford.
- LONDON.** *Geography and Statistics*, H. B. WHEATLEY, Assistant Secretary, Society of Arts, Author of "London Past and Present"; *Government and Administration*, F. F. LIDDELL, M.A., Barrister-at-Law, Fellow of All Souls College, Oxford.
- LOUISIANA.** Professor ALCÉE FORTIER, Litt.D., President of the Louisiana Historical Society.
- LOWELL, JAMES RUSSELL.** HORACE E. SCUDDER, Litt.D. (the late), Author of "The Life of James Russell Lowell."
- LUBRICATION.** OSBORNE REYNOLDS, LL.D., F.R.S., Professor of Engineering, Owens College, Manchester.
- MACDONALD, SIR JOHN A.** G. R. PARKIN, LL.D.
- MACEDONIA.** J. D. BOURCHIER, M.A., Correspondent of "The Times" at Athens.
- MACHINE GUNS.** Major H. W. W. BARLOW, R.A., Royal Ordnance Factories, Woolwich.
- MCKINLEY, PRESIDENT.** ALBERT SHAW, Ph.D., Editor of "The American Review of Reviews."
- MADAGASCAR.** Rev. JAMES SIBREE, Author of "Madagascar and its People."
- MADRAS PRESIDENCY.** J. S. COTTON, M.A., sometime Editor of "The Academy"; Author of "India" (Citizen's Series), Quinquennial Report on Education in India, 1898, &c.
- MADRID.** A. E. HOUGHTON, L.C.L., Author of "Restoration of the Bourbons in Spain."
- MAGIC.** J. NEVIL MASKELYNE and G. FAUR, Egyptian Hall, London.
- MAGNETISM.** SHELFORD BIDWELL, D.Sc., F.R.S., President of the Physical Society, 1897-99.
- MAGNETISM, TERRESTRIAL.** CHARLES CHREE, F.R.S., Superintendent of Observatory Department, National Physical Laboratory.
- MAGNETO-OPTICS.** J. J. THOMSON, F.R.S., Cavendish Professor of Experimental Physics, Cambridge.
- MAHOMMEDAN LAW.** Sir WILLIAM MARKBY, K.C.I.E., D.C.L., formerly Reader in Indian Law, Oxford.
- MAINE.** Hon. J. L. CHAMBERLAIN, A.M., LL.D., Governor of Maine, 1866-1871.
- MALACOSTRACA.** The Rev. T. R. R. STEBBING, F.R.S., F.Z.S.; Author of "A History of Crustacea."
- MALAY ARCHIPELAGO.** H. O. FORBES, LL.D., F.R.G.S., Author of "A Naturalist's Wanderings in the Eastern Archipelago," and I. P. A. RENWICK, M.A., Assistant Editor "The Statesman's Year-Book"; *History*, H. TIEDEMANN.

- MALAY PENINSULA, MALAYS, MALAY STATES.** HUGH CLIFFORD, C.M.G., British Resident, Pahang; Joint-Author of "A Dictionary of the Malay Language."
- MAMMALIA.** RICHARD LYDEKKE, F.R.S., F.Z.S.
- MANCHESTER.** W. E. A. AXON, LL.D., Author of "The Annals of Manchester" and "Manchester a Hundred Years Ago."
- MANNING, CARDINAL.** The Rev. A. W. HUTTON, M.A., Author of "Cardinal Manning."
- MAP.** E. G. RAVENSTEIN, Author of "Systematic Atlas," &c., and Dr SOPHUS RUGE, Professor of Geography, University of Dresden.
- MARKET.** WYNNARD HOOPER, M.A.
- MARRIAGE.** *Europe*, THOMAS BARCLAY; *United States*, W. F. WILCOX.
- MARTIAL LAW.** Sir JOHN SCOTT, K.C.M.G., Deputy Judge-Advocate-General.
- MARTINEAU, J.** The Rev. A. M. FAIRBAIRN, D.D., LL.D., Principal of Mansfield College, Oxford.
- MARX, HEINRICH KARL.** EDUARD BERNSTEIN, Author of "History and Theory of Socialism," &c.
- MARYLAND.** W. T. BRANTLY, Ex-Secretary of State, Maryland.
- MASSACHUSETTS.** Hon. ROGER WOLCOTT (the late), sometime Governor of Massachusetts.
- MATHEMATICAL INSTRUMENTS.** Professor OLAUS F. M. E. HENRICI, Ph.D., LL.D., F.R.S.
- MEADE, GENERAL G. G.** Gen. A. S. WEBB, Author of "The Peninsula," "McClellan's Campaign of 1862," &c.
- MEASURING INSTRUMENTS.** J. A. FLEMING, D.Sc., F.R.S., Professor of Electrical Engineering, University College, London.
- MEDICAL EDUCATION.** *Europe*, Sir JOHN BATTY TUKE, M.D., D.Sc., M.P.; *United States*, W. H. HOWELL, Ph.D., M.D., Dean of the Medical Faculty, Johns Hopkins University.
- MEDICAL JURISPRUDENCE.** HENRY HARVEY LITTLEJOHN, M.B., B.Sc., Lecturer in Medical Jurisprudence, School of Medicine, Royal College of Physicians and Surgeons of Edinburgh.
- MEDICINE.** THOMAS CLIFFORD ALLBUTT, M.D., D.Sc., F.R.S., Regius Professor of Physic, Cambridge.
- MELBOURNE.** J. D. FITZGERALD.
- MERCURY.** S. B. CHRISTY, Professor of Mining and Metallurgy, University of California.
- METAL WORK.** J. STARKIE GARDNER, Author of "English Enamels," "Iron Work," &c.
- METALLURGY.** Sir W. C. ROBERTS-AUSTEN, K.C.B., F.R.S., Chemist of the Mint.
- METAPHYSICS.** THOMAS CASE, M.A., Professor of Moral and Metaphysical Philosophy, Oxford.
- METEOROLOGY.** Professor CLEVELAND ABBE, Ph.D., LL.D., Meteorologist, U.S. Weather Bureau.
- METHODISM.** The Rev. HUGH PRICE HUGHES, M.A., Editor of the "Methodist Times," and the Rev. J. M. BUCKLEY, D.D., LL.D., Editor of "The Christian Advocate," New York.
- MEXICO.** *Geography and Statistics*, The Hon. W. W. ROCKHILL, Head of the Bureau of American Republics, Washington, and I. P. A. RENWICK, M.A., LL.B.; *History*, J. S. MANN.
- MICHIGAN.** A. C. McLAUGHLIN, A.M., Professor of American History, University of Michigan.
- MIGRATION.** The late Professor RICHMOND MAYO-SMITH, Ph.D.
- MILAN.** LUCA BELTRAMI, Author of "Storia della facciata di St Maria del Fiore in Firenze," &c.
- MILITARY LAW.** Sir JOHN SCOTT, K.C.M.G., Deputy Judge-Advocate-General.
- MILITIA.** Major A. B. C. WILLIAMS, Indian Staff Corps.
- MILLAIS.** COSMO MONKHOUSE (the late), Author of "British Contemporary Artists," "The Italian Pre-Raphaelites," &c.
- MINIATURES.** G. C. WILLIAMSON, Litt.D., F.R.S.L.; Author of "Portrait Miniatures," &c.
- MINING.** C. LE NEVE FOSTER, D.Sc., F.R.S., H.M. Inspector of Mines.
- MINNESOTA.** FRANK L. McVEY, Ph.D., Assistant Professor of Political Science, University of Minnesota.
- MISSIONS, MODERN.** EUGENE STOCK, Editorial Secretary of the Church Missionary Society.
- MISSISSIPPI.** R. B. FULTON, LL.D., Chancellor of the University of Mississippi.
- MISSISSIPPI RIVER.** Gen. C. B. COMSTOCK, U.S.A.; sometime President of the Mississippi River Commission.
- MISSOURI.** M. S. SNOW, A.M., Professor of History, Washington University, St Louis.
- MODELS.** LUDWIG BOLTZMANN, Professor of Physics, Vienna University.
- MOLLUSCA.** PAUL PELSENER, D.Sc., Lecturer, Brussels University.
- MOLTKE, FIELD-MARSHAL COUNT VON.** H. SPENCER WILKINSON, M.A.; Author of "The Brains of an Army," &c.
- MONGOLIA.** Prince KROPOTKIN.
- MONROE DOCTRINE.** T. S. WOOLSEY, Professor of International Law, Yale University.
- MONTANA.** Hon. WILLIAM M. HUNT, Governor of Porto Rico; formerly Justice of the Supreme Court of Montana.
- MONTENEGRO.** J. D. BOURCHIER, M.A., Correspondent of "The Times" at Athens.
- MOON.** Professor SIMON NEWCOMB, Ph.D., LL.D., D.Sc.; formerly Director U.S. "Nautical Almanac," Professor of Mathematics and Astronomy, Johns Hopkins University.
- MORMON CHURCH.** G. M. MARSHALL, Ph.B., Professor of English Languages and Literature, University of Utah.
- MOROCCO.** BUDGETT MEAKIN, Author of "The Moorish Empire," &c.
- MORRIS, WILLIAM.** ARTHUR WAUGH, Author of "Alfred, Lord Tennyson."

PREFATORY ESSAY.

MODERN CONDITIONS OF LITERARY PRODUCTION.

By Augustine Birrell, K.C.

LITERATURE in its widest sense is as large as human life, and has been produced after some fashion or another at all times and in all places, though happily not yet *ab omnibus*. Before pens and ink were invented men had found means to commentate upon their environment, and to record their history "with quipo-threads, with feather-pictures, with wampum-belts, still oftener with earth-mounds and monumental stone-heaps, whether as pyramid or cairn." But the conditions under which literature has been produced have ever been changeable, and still continue to change; and being subjected as they are to all the influences that mould society and alter manners, any history of them that aimed at completeness would resolve itself into a record of that vast, mysterious, fascinating, perplexing movement, which is sometimes called Progress, sometimes Evolution, and sometimes Destiny.

The purpose of this essay is more modest, namely, to call attention to a few of the more obvious changes that have occurred in the last half of the 19th century in the production and distribution of printed matter. Error lies in wait at the portals of the humblest Inquiry, eager to take the outspread hands of the anxious inquirer, and personally to conduct him by the pleasant paths of Hasty Generalization to the resting-place of False Conclusions. As we step cautiously into the arena of the book market, our ears are deafened with the roar of its Niagara, its tremendous output, and straightway are excited within us feelings of amazement, admiration, or dismay. The newspapers of a single week, piled one on the top of another, would make a decent hill in a flat country, whilst monthly magazines issue forth in crowds. The spread of what Goethe shudderingly called "half culture" is noticeable everywhere. Even polite learning has not wholly escaped the taint of trade. Parnassus is undoubtedly a very noisy mountain, where publishers shout their wares, and authors seek to gain popularity by the doubtful device of exhibiting their photographs. A commercial spirit pervades the atmosphere. And no wonder! Fortunes stockbrokers might envy await the few who can succeed in winning and retaining, though it be but a short while, the ear of some or other of the "publics," into which the book-readers of the world are divided. There it is, the great restless, swaying crowd, peopling whole continents, waiting to be amused, to be excited, to be inflamed, to be taken out of themselves; who would not reach it, teach it,—tax it, if he could? That very risible farce, *Charley's Aunt*, has made more money than is represented by the united fortunes of Scott, Thackeray, and Dickens. Had there been American copyright a generation earlier, the clever authoress of *East Lynne*, or her publishers, must have drawn at least £50,000 from trans-Atlantic readers. It is a pleasant thing, let critics say what they may, to spin a snug family-fortune out of the inventions of your brain.

Considerations of this kind, however, lie merely on the surface, and though they may lend them-

selves to a sardonic humour, or supply an outlet for the spleen of authors whose books do not command fortunes, or readily convert themselves into neat villas, they carry us a very little way in our investigation. There is nothing new under the sun, except the conditions under which men go forth to their labour or their folly. The booksellers of the 17th and 18th centuries were every bit as anxious to make money for themselves and their families as any publisher to-day can be. An excellent account of our early booksellers is to be found in John Dunton's *Life and Errors*, first published in 1705. A few of these men were rogues, others of very doubtful virtue, but some were good fellows; and as for the authors, they did the best they could for themselves. Some of the worst of them made a great deal of money, and some of the best of them very little, and people complained then just as they do now of the degeneracy of the times and the vulgarity of the age. Indeed, before the age of printing, and when "the trade" was engaged in selling manuscripts, employing in Paris and Orleans alone ten thousand copyists, doleful cries resounded in University and Church circles as to the evil consequences of cheap learning and unlicensed reading. The movable types did not create, though they greatly helped to promote, what is called the Revival of Learning, *i.e.*, the spirit of inquiry. Nor will any one who has any general acquaintance with the literature of the Renaissance marvel at this outcry. To confine your attention to masterpieces is not the best way to appreciate the tone and temper of the period that produced them.

I will take as my point of departure the 1st of July 1842, when the Copyright Act for Books, which is still in force, first came into operation. About this Act itself one or two things are significant. First note the old-world simplicity of its preamble, "Whereas it is expedient to amend the law relating to copyright, and to afford greater encouragement to the production of literary works of lasting benefit to the world." In some dim, undefined way it was supposed that the monopoly called "copyright" could only be justified if it were confined to literature of the highest class; and certainly Macaulay in his famous speech in Parliament dealt only with great examples, and the orator would have been very much put out had he been told to say something about the tradesmen's catalogues and stockbrokers' price-lists, which the judges have decided are as much entitled to the benefit of the Act as Darwin's *Origin of Species* or Macaulay's own *History*. There is no good reason known to me why catalogues and price-lists should not be protected, for the eighth commandment, "Thou shalt not steal," is or ought to be a law of universal obligation, but it is interesting to notice how a monopoly that was with great difficulty, and after long delay, wrung from the Legislature in favour of "literary works of lasting benefit," was willingly, though in violence to the spirit of the Act of Parliament, extended by the judges in favour of the trading community.

Another thing to notice about the Act is its innocence of the British colonies. In 1842 nobody thought about them—indeed, it was in the course of the speech already referred to, that Macaulay made the observation, "There is none of us who would lay down £5 for a whole province in the heart of the Australian continent." The Act, though imperial in its scope, including as it did "all parts of the East and West Indies, and all the colonies, settlements, and possessions of the Crown which now are or hereafter may be acquired," was purely insular in its methods, since its provisions involved publication within Great Britain or Ireland of the book that was to be protected. It never occurred to any one that a Canadian or an Australian author might publish a book in Montreal or Sydney. In those days we English had the homely wits of home-staying men.

Passing away from the Copyright Act of 1842, but keeping its date in mind, the first altered condition, and one the most worthy of notice, to which I would call attention, is that of Population. Between a country containing less than sixteen millions of inhabitants (the population of England and Wales in 1842) and the same country containing thirty millions, great must be the difference. It is difficult to be isolated in the England of to-day. The pressure of the environment is enormous. The contagion of the crowd is quickly propagated. Uniformity is produced. Oddities, quaintnesses, humour-some prejudices, local peculiarities, dialect, persistent individualities, "characters" are disappearing from English life as rapidly and as irrevocably as so much that was picturesque and lovely in English landscape. There is a passion for equality in externals that is born of numbers. To dress like your neighbour, to live under the same kind of roof, and to eat at the same hours as he does, to share his tastes, to repeat the same catchwords—all this seems natural and desirable in thickly-populated districts.

When once a book or a paper can be introduced to the notice of such homogeneous compounds, its fortune is made, for it rages among them like an epidemic. This contagion of the crowd powerfully influences the supply and demand of books and newspapers.

In a great population animated by democratic notions, recognizing no external authority in matters of faith or taste, with a growing passion for equality and a greedy desire to handle the good things of this world, as recommended by the modes and methods of life of the wealthy and luxurious, it would be irrational to expect to discover any general refinement or delicacy of thought or feeling. We may rejoice if we are able to observe prevailing signs of a dominant healthy manhood in our recreation grounds, theatres, music halls, factories, regiments, and wherever else our vast populations lead their lives. To expect too much of the human race is the ancient error of moralists and the sin of the satirist. In his lecture on "Numbers," delivered in the United States, Mr Matthew Arnold illustrated by quotations from Plato and Isaiah the truth that it is always the remnant that saves a nation or a race, and the advantage of a big country and a great population is that the remnant has at least a chance of being a good large one. A country that has left off breeding has abandoned hope.

Next in importance to the growth of population in the last half-century is the extension of popular Education, which cannot be overlooked when considering the changes that have taken place in the production of literature. The great object of popular education is or ought to be to teach the people to read with perfect ease, and as much intelligence as can be mustered. Unless they can read with ease ninety-nine men out of a hundred will never read at all. The real University, said Carlyle, is a Collection of Books. I cannot admit this to be precisely true, since the function of the University is to teach, but unless books are within your reach physically and mentally, there can be no teaching for you, and primary education must fail to effect its purpose. In 1842 people in England were an unlettered race, a large percentage of the population being unable to read or write. The only public money devoted in that year to the work of primary education was a Parliamentary grant amounting to £29,618, 5s. 10d. In rates and taxes the annual expenditure solely directed to the same end amounted in 1902 to (at least) £16,000,000 sterling. 1842 is a melancholy date in the unhappy history of English education, for it was that year that witnessed the defeat (owing to ecclesiastical squabbles in which neither the parents nor the children had the faintest interest or concern) of a considerable measure of National Education. What a picture is that drawn by the master hand of Dickens, himself one of the greatest popular educators of the age, of little "Jo" moving about among the hieroglyphics of the London streets!—

It must be a strange state to be like Jo! To shuffle through the streets unfamiliar with the shapes, and in utter darkness as to the meaning of those mysterious symbols, so abundant over the shops, and at the corners of streets, and in the doors, and in the windows! To see people read, and to see people write, and to see the postman deliver letters, and not to have the least idea of all that language—to be to every scrap of it stone blind and dumb! It must be very puzzling to see the good company going to the churches on Sundays with their books in their hands, and to think what does it all mean, and if it means anything to anybody, how comes it that it means nothing to me? To be hustled and jostled and moved on; and really to feel that it would appear to be perfectly true that I have no business here, or there, or anywhere; and yet to be perplexed by the consideration that I am here, somehow, too. Jo's ideas of a criminal trial, or a judge, or a bishop, or a government, or that inestimable jewel to him (if he only knew it) the constitution, should be strange. His whole material and immaterial life is wonderfully strange; his death, the strangest thing of all.

"Jo" had to wait from 1842 to 1870 for his education, but he has got it now; for although it cannot, and probably never will be said of Englishmen that they are a reading people, they have at least become a people who can read.

The immediate result of these changes in Great Britain, both in numbers and intellectual qualifications, has been the multiplication of cheap periodical prints, for to call them generally "newspapers" would be inaccurate. The vastness of the public who can read, the marvellous plenitude of copper coins, the cheapening (though the price varies very much) of paper, the extraordinary perfection of the printing-press, and the many processes for producing pictures, have both tempted and enabled those traders who

are concerned in such matters to put upon the market day by day and week by week the most bewildering number of "papers" (as they are called) for men, women, and children—some with pretentious pictures, others with drawings and cuts, which appear to find ready purchasers in the streets. In these papers is to be found a great variety of matter. Amidst a little that is positively bad, and much that is distressingly trivial and vulgar, occasionally may be noted a touch of elevation, chiefly conveyed by means of quotations, which are at least capable of awakening a response in minds attuned to better things.

The activity of the press is not confined to the production and distribution of newspapers and periodicals. It also turns out, by the million, popular books at democratic prices. This cheapening of books is one of the great facts of the age. For a penny apiece may be bought no inconsiderable number of books, and among them are included some of the most famous in the world; whilst any one who is prepared to give sixpence a copy may include in his library almost everything that is really worth reading in the English tongue, whether grave or gay, in verse or prose.

To measure the effect upon the population of this amazing output is impossible. Cheap books have their drawbacks. A twopenny Bible is not treated with much deference. Still, the sale of a million copies of such a book as Charles Kingsley's *Westward Ho!* at fourpence-halfpenny a copy means something. Cheap books disseminate the habit of reading, circulate the knowledge that there is pleasure to be got out of books, stimulate the desire of a wider range of study, contribute to the refinement of the race, and so affect the conditions under which books are produced and distributed.

Here, again, I must be permitted to interpolate the remark that it is the size and reading-power of the crowd that have changed rather than its character, for there has been for many a long year a market for cheap books in England. Long before 1842 enterprising and not always over-scrupulous cheap booksellers had the wit to see that money was to be made out of the masses by providing them with books no less than with gin and beer. Book-stall hunters still see perched on their upper shelf the editions of these pioneers of popular education—ill-printed it may be, but handy for the pocket—*Tom Jones*, *The Vicar of Wakefield*, *Tristram Shandy*, all our British poets, and many another volume of delight; what is more, these cheap booksellers made large fortunes.

There have always been readers among all classes in England. *The Pilgrim's Progress* and *Robinson Crusoe* were from the first the favourites of the populace, whilst chap-books, prophecies, like those of "red-faced Nixon" (named in *Pickwick*), ballads, and tales, have proved more profitable to their printers than heavier works have done. But the crowd was a small crowd and an ill-educated one; now it is a larger crowd, and can read. To expect this crowd to devote its scanty leisure, gained after hours of exacting labour or distressing tedium, to the perusal of masterpieces is unreasonable. To hard-working men and women, and, unfortunately we must add, to hard-working children, reading can never be more than a pastime competing with many other pastimes. The newspaper and the story-book are not likely to be dethroned until the conditions of human life undergo greater alterations even than those that have been witnessed during the last half-century.

In the class above what are commonly called the working class a great change is noticeable in the style and character of their books and reading. We hear complaints loud and long in England about Secondary Education, and they are mostly just complaints, but it is sheer ignorance to suppose that the Act of 1870, and the splendid work of the best School Boards, although confined to what is called "Primary Education," have not had a great effect upon the intelligence of the middle classes, who, finding themselves left out of the national calculations, have taken their culture into their own hands. In this undertaking they have been greatly assisted by the publishers and printers, who have sent forth an ever-increasing number of good books, cheap in price, and in many cases carefully edited. It is the fashion of middle-class people to abuse the middle classes, to call them Puritans and Philistines, tasteless and "suburban," but no inconsiderable portion of this class have had the good sense to profit by this abuse, and have gone steadily on their way, reading good books, attending lectures, making notes, curing their defects, enlarging their horizons, and purifying their tastes, until, far short as they still may be of perfection, they can hardly be said to be far behind their critics, who indeed are usually the more impecunious members of their own households.

In proof of this improvement I can appeal to the private libraries of the land. In the 'forties and 'fifties of the last century the books in too many middle-class homes were a doleful crew, and unless the heads of the family were closely identified with some religious body of publishing proclivities, few in number. A badly-printed Shakespeare was to be found somewhere, and Robertson's Histories, and Josephus in one volume. Hervey's *Meditations among the Tombs* and Zimmerman on *Solitude* were in the best bedrooms, and perhaps John Newton's *Cardiphonia*. These latter are now scarce books. With good luck you might hap upon Pope's *Homer* and the *Essay on Man*, or some odd volumes of the *Spectator* and a tiny *Rasselas*. For poetry there was Thomson's *Seasons*, Cowper's *Task*, and Longfellow alone of the moderns.

Now the blessed change! In countless households scattered up and down the country intelligent students are to be found of Chaucer, of Spencer, of Shakespeare. Modern editions of Bacon's *Essays*, the *Anatomy of Melancholy*, of Walton's *Angler* and *Lives*, of Sir Thomas Browne's *Religio Medici*, of Montaigne's *Essays*, of Jeremy Taylor's masterpieces, of Milton's prose, are as plentiful as blackberries in September. Miss Austen rules with a mild sceptre over a thousand homes, and little Miss Burney once more has her admirers. The Waverley Novels take the field almost every year in some fresh guise. Galt's *Provost* and *Annals of the Parish* give rise to many a quiet chuckle; Charles Lamb is among the Lares and Penates of Great Britain; Hazlitt has come to life again. It is no exaggeration to say that the whole capacious field of English literature has been ransacked and rifled of its choicest treasures in order to place them in good type, on good paper, and at a low price within the reach of almost every one who has any true feeling for books and reading.

It is an age of cheap reprints and collected editions and literary appreciations. It is easy to sneer at cheap culture, and crude admiration, and University Extension Lectures. It is not given to many to enter into the soul of any literature. The best judges often make great mistakes, and it cannot be expected that good taste should be universal; but among our middle class there has sprung up, of late years, an honest love of literature. England is now full of good editions of good books, and the demand for them increases. This is one of the conditions under which literature is produced to-day.

Midway between the Newspaper and the Book stands the Magazine—a now almost venerable form of literature. How many an author has been able to recall, as the great "Boz" loved to do, his emotions on reading his first "article" in a magazine! Dr Johnson wrote for a magazine. Sir Walter Scott was a diligent contributor to periodicals. Lamb, Hazlitt, De Quincey, Carlyle, Thackeray, Dickens, Froude, Matthew Arnold, were all "magazine" men, and their collected contributions, torn from their first birth-places, now make famous books in their own right. Magazines have played no mean part in disseminating literature and encouraging literary ambitions, and have helped to increase the numbers of those who are on the look-out for books on all the varied subjects of interest with which magazines concern themselves. Almost every subject has its own magazine; nothing is too old or too new—one member of a family is mad about motor cars, another cares for butterflies, a third for folk-lore and early religions, a fourth for pedigrees and book-plates, a fifth for prints and ivories; each has his pet magazine. All this endless inquiry promotes and stimulates the book market to an extent which would make old "Sylvanus Urban," and good Mr Bowyer and his biographer, Mr John Nichols, stare and gasp.

Another powerful influence of the time is the spread of public and proprietary libraries throughout the land. There are four kinds of libraries—the Private Library, the Public or Free Library, the Proprietary Library, and the Circulating Library. To the private library reference has already been made. I am well persuaded, despite the grumblings of the booksellers, who sell new books and have their great difficulty about discounts, that the private libraries of the land, if so important a word may without offence be applied to small collections, go on steadily improving in England. Scotland in this matter lags behind. Public or Free Libraries have, of course, enormously increased in number, being not only the pet objects of two well-known money-givers,—Mr Passmore Edwards and Mr Carnegie,—but, if a popular vote can be obtained (not always an easy matter), they can be supported, to a limited extent, out of the rates. In almost all the large English towns, and in not a few villages, free libraries rear their

heads. The contents of free libraries vary very much, but there they are, bringing knowledge and pleasure within the reach of nearly everybody. Tired men and women, imperfectly educated, will not frequent public libraries in large numbers to read history, philosophy, or science; they will prefer to turn over the back numbers of illustrated papers, or to read some stirring tale or romantic adventure, nor is their taste in these matters likely to be a cultivated one. But the habit of reading is generated, strengthened, and possibly transmitted; and besides this, it is surely a comfortable thought, that assuming a child to have genius or capacity, the desire for knowledge, or the craving after perfection, no longer can chill penury shut him out from the accumulated wisdom of the race to which he belongs. The waste of a free library is nothing to the waste of Nature. The Proprietary Libraries which supply their members and subscribers with books, and as it were keep a library for them, have done more than the Universities to spread a love of reading among the middle classes. In most large towns such libraries exist on a considerable scale, and have been, and are, true centres of education. Lyceums, Athenæums, and other high-sounding names, describe places to which many of us owe much. Of the Circulating Library it is unnecessary to speak, for all are acquainted with its beneficent operations.

The booksellers eye all these public and semi-public establishments with disfavour, thinking that they dissuade people from buying books. I doubt this being so. Speaking generally, the more people read the more books will they have about them; the fact that there are now collected in public, proprietary, and circulating libraries, many millions of books, and that these places of resort are daily visited by thousands and thousands of readers, must have some effect in promoting the demand for literature.¹

The habit of travelling by rail, now so general, is thought by some observers to have increased the disposition to read on the part of an otherwise sluggishly-minded population. The railway book-stall has perhaps played some part in education; if so, it has been but an obscure part, for except in the matter of newspapers and the most advertised novel of the moment, it cannot be said even to respect the average intelligence of the travelling public. A reformed railway book-stall is a dream of the future; but perhaps railways themselves may have become a memory of the past before this dream has even a chance of realization.

Let us go farther afield. What is to be said of those vast multitudes all the world over who read English as their native tongue? In 1842 the white population of the United States of America was a very little over fourteen millions—it was in 1902 more than sixty-seven millions. The population of Canada increased from a million and a half to five and a half millions, whilst the Australian Colonies, with but a quarter of a million in 1842, contained in 1902 more than three and a half millions of inhabitants. All these good people, or such of them at least as are not infants, read books; and though settlers in new countries are not great readers, having other things to do, still signs are not wanting to indicate that the Colonial book market will soon be a busy one. It is, however, the growth of the population in the United States that is the most important factor in the case, for in the States are to be found (to use Mr Arnold's word) a "remnant" great in numbers, even though it be but a minority of the whole population, who both think and read, and pursue with unresting energy and an amazing seriousness a thousand fancies and phantoms of the brain. The American Copyright Acts of 1891–95, by conferring the monopoly of reproduction on all books printed and published within the States (following in this respect the British Copyright Statute of 1842), have gone a long way to unite the British Islands and America into a Book-Union. There is a complete reciprocity of authors; and though many American-bred authors find a great sale in their native land, and hardly any in the United Kingdom, and many British authors who are, in the vile phrase of the trade, "much esteemed" at home, count for next to nothing in the States, still the tendency is, and must be, to throw all English-writing authors into hotch-pot, to find their readers wherever they can. London publishers have very close connexions with New York. A popular author in England is quite as likely to receive a call from an American as from an English agent. The sermons of a popular divine, the last story of a popular novelist, the new drama of a popular playwright, circulate freely on both sides of the Atlantic; whilst for the graver work of the theologian, the philosopher, moral or political, and the historian, there is the same well-tempered

¹ In the free libraries of eight British towns there are gathered together more than a million volumes.

enthusiasm in Boston as in London, and in London as in Boston. The reading public of both countries is now equally within the reach of every English-writing author. It is indeed an enormous public. When St Augustine wrote his *City of God* he too had a great public, and his famous treatise, copied though it had to be by hand, soon spread itself over Europe; but what was Augustine's public in numbers compared with that of an author of to-day, who catches the fancy of both England and America?

Under these conditions it is not surprising that there should be an enormous output of books, and particularly of books which do not demand of those who produce them any great store of acquired learning. The novel lies to anybody's hand. Anybody, so it is said, can write a dozen bad novels or one good one. It is easier to believe the first part of this saying than the second. Fortunately everybody does not try, although the temptation to do so must be great, for this huge possible public is divided into many markets, each quite distinct from the other, and to gain a reputation in any one of these markets is to succeed—not necessarily as an artist, but as a family man. Nobody knows with any degree of precision all the markets. The late Mr James Payn knew many things about books, but he did not know the *John Inglesant* market, or, at all events, he had not watched its growth. There are indeed many markets where a lively trade is done in books and papers, for fiction is only one of the fields now cultivated with an almost nervous activity. In almost every department of Belles Lettres—including in that phrase the popular aspects of theology—in popularized science, and in Philosophy, the labourers are many. Little books are written about big books; and big books are written about little men; essays, monographs, appreciations abound. It is debated whether our living poets are to be counted by tens or scores. Book-making goes on all round. We can almost hear the clicking of the type-writer. The commercial spirit has never been absent from literature, but in earlier times the author was in the background. All he had to sell was his manuscript—this he did, if he could, to a member of the Stationers' Company, who straightway registered it as his own "copy." To-day authors take the front seats, or try to do so, and as they are a numerous body they necessarily make a great deal of noise. Women, too, in large numbers, have joined their ranks. The feminine note is predominant in some departments of Literature.

We are thus forced to contemplate three great crowds—one of readers, one of producers, and a third of distributors. Here is where the conditions have altered—in the size and intellectual equipment of the reading public, and consequently in the numbers of those engaged in the work of supplying, fostering, and stimulating its unceasing and increasing demand for something to read. To expect delicacy and distinction to be characteristics of such a roaring mart as this would be irrational. On the other hand a tendency would be expected, and has in fact occurred, to produce numbers of books of practical utility,—primers of science, history, literature,—volumes making knowledge easy and easily accessible. This is particularly the case in America, where the people at large began to "want to know" much earlier than the corresponding public in England.

A noticeable incident of the time, and one significant of much change in the conditions of the book-market, is the disposition to combine which authors have lately exhibited. This is a new thing, for, as a rule, authors have hitherto taken small pleasure in each other's society. It is mainly a trade feeling that has brought them together, although no doubt the instincts of the journalist—and how many writers of books are journalists!—have always been gregarious. The combination of authors has done a good deal to improve their condition commercially, and it may some day do something to destroy the cruel delusions that there is a market for every kind of paper-staining, and that anybody who has ever written anything has a claim upon the consideration of his fellow-men, and a right to find a publisher ready to employ both capital and labour in palming off upon the public a new book.

One other powerful influence of the time must not pass unnoticed—the influence upon the minds, both of authors and readers, of foreign literatures made generally known by means of translations. Never before since the days of Elizabeth has the ordinary English reader been so familiarized with foreign books. Tolstoy is one of the spirits of our age. No English author since Dickens has so powerfully moved so many English people, whilst there are at least a dozen French authors, chiefly novelists, whose influence upon British writers has been enormous. Nor can Ibsen and Maeterlinck be counted for little. Cosmopolitanism in

literature may be expected. The whole western world is pervious to the same ideas. Though in statecraft the tendency may be for the consolidation of kindred states and the isolation of dominant races, in the realms of science, thought, and imagination a counter influence will more and more assert itself. International copyright is the first law which can with pardonable exaggeration be described as having been passed in the Parliament of Europe. With a few exceptions it is now true that a European author enjoys in every country in Europe the same property rights in the works of his brain as the law of his own country confers upon its native-born writers.

The change is indeed great since the days when Madame de Staël, being banished from France, first introduced Germany to the notice of polite Europe; since 1834, when Carlyle, striving and crying in the pages of *Fraser's Magazine*, besought his countrymen, who had not then learnt to endure his style, "to close their Byron and open their Goethe"; and when none but a few pale students knew more of the Literature of Italy than was contained in a canto of the *Inferno*, a sonnet of Filicaia's, and the novel of Manzoni.

Now that the *Fumée*, the *Pères et Enfants* and the *Étranges Histoires* of Tourguéneff, the *Anna Karénine* and *Résurrection* of Tolstoy, and *Le Crime et le Châtiment* of Dostoieffsky have made dumb Russia speak at last, it is not too much to say that all Europe contributes to a general fund or stock of ideas available for the common use.

And what is more, there are many English and American readers who take more kindly and sympathetically to the ideals and thought-tendencies of foreign authors—even when read, as they generally have to be, in translations—than to those of their native authors. Nor is this always due to the superior genius of the foreigner; it may be partially accounted for by his freedom from literary restraints that have grown stale and by the freshness of his imagery and novelty of atmosphere. Nor will this disposition of mind be destroyed by ridicule. *Wilhelm Meister* has survived the unseemly merriment of De Quincey, nor have the shafts of Mr Anstey's admirable humour injured the permanency of Ibsen's reputation.

But whilst we cannot fail to notice from what widely different quarters, from what strange sources and far-off countries, the "reading public" now derives its sustenance, and how completely our mental ports are thrown open to the literary goods of the foreigner, it would be rash to attempt even to name the rival influences that visit our shores in these strange times, and either contend with those of native manufacture for mastery over us, or at least imperatively demand the rights of expression and free circulation. Never before were so many influences at work upon men's minds, seeking to mould and control them, as now. If it would be difficult to name these influences, to seek to estimate their several strengths would be clearly impossible.

Whether the minds of men are more readily moved to important issues by the force of great events or of great thoughts is hard to determine. The French Revolution—though of course itself the result of a thought-movement—had a more obvious effect upon the current of men's thinking than have most of the great books of the world. This probably is what was in Michelet's mind when, if Mr Lewes is to be believed, he once began a lecture as follows: "Messieurs, dans ce monde il y a deux nations. Ces deux nations, messieurs, sont les Juifs et les Français. Ces deux nations, messieurs, ont deux livres, seulement deux. Les Juifs, messieurs, ont la Bible; les Français ont la Révolution."

For present purposes it is enough here to note the expansion of the Englishman's Library. The old, famous, homespun names which have so long reigned over our shelves, with no competitors save the Delphine Classics, have not indeed been forced to abdicate—for supreme they will probably ever remain within these Realms—but, in future, they must be content to brook with foreign rivals very near their thrones.

To attempt to state in exact language the results that have followed these changed conditions in the production of modern literature would be impossible, but one of those results is particularly noticeable. Modern literature is singularly sensitive, and reflects almost instantaneously the humours and sentiments of the hour. Owing to our numbers, our great populations living closely together, and the general spread of education, ideas are now most infectious, and run through the land with amazing agility. We act and react upon each other. A particular spirit or tendency evokes an author, and the author generates with

velocity the spirit that begot him. As examples of what I mean may be cited two writers, Captain Mahan and Mr Rudyard Kipling. It is but the other day that these two men began to write, each in his own different way, and yet what an impression they have already made, what an influence they have exerted! Their thoughts and arguments, their tricks of speech, are recognizable everywhere—have become to a greater or less extent part and parcel of the intellectual output of the average man. Never before surely was this contagiousness of ideas so noticeable.

When once an idea or notion has taken root, a whole host of ready writers grab hold of it, and with loud cries and exclamations carry it into every quarter. They popularize it, they vulgarize it, they mix it with their cheap spirits or their cold water, but in one way or another they fit it for every palate. It does not matter what the notion may be,—imperialism, federalism, evolution, sacramentarianism, or only a particular kind of humour, or a mode of narrative; if it has any popular virtue within it, it will be caught hold of and carried in triumph into every book market of Great Britain. The imitators, who sometimes are skilful men, and sometimes gross and clumsy personators, are often more prosperous than the originators—if indeed any one is entitled to be called an original. The doctored article is usually more to the taste of the many than the true manufacture, which is apt to have a certain pungency, sternness, and reticence almost certain to be “caviare to the general.” This characteristic of the time is naturally pleasing to those observers who share the prevailing sentiment, and not so agreeable to those who remain either unconscious of its claim or suspicious of its tendency. When the crowd is on your side you regard its rude horse-play with benevolence; if it is against you, with disgust. Moods will vary, opinions change, “no altar standeth whole,” but this responsiveness of the public mood to the prevalent spirit of the time will probably grow quicker and keener with the growth of population and the spread of popular education. An age of widespread diffusion of knowledge can hardly present a romantic aspect. A dungeon is more romantic than a school. Large masses of people, necessarily very imperfectly educated, but with a great conceit of themselves, all eager to know and discuss results, and to experience new sensations, are not likely at first to throw their influence on the side of the things that are “quiet, wise, and good.” Dwellers in great cities and in populous and half-educated countries must learn to put up with a great deal of noise of all kinds. It is absurd to be too sensitive. Everything runs its course. After contemplating the changed conditions of modern literature, we may congratulate ourselves that wherever we look we see all the symptoms of life and activity in a people striving to get quit of the clogs of ignorance, and to enter upon the glorious inheritance that belongs by right to every cultivated intelligence.

ENCYCLOPÆDIA BRITANNICA.

(NEW VOLUMES.)

KABADIAN—KABUL

Kabadian, a bekdóm of south Bokhara, Hissar region, situated on the right bank of the Amu river, between the lower courses of its two tributaries, Vaksh and Surkhan. It is also watered by the Kafirnagan, another tributary of the Amu. The population consists mainly of Uzbeqs, whose chief occupation is agriculture, silk-worm culture, and gathering of pistachio nuts. The chief town, of the same name, is a walled town, built on an island formed by two branches of the Kafirnagan, 30 miles above its junction with the Amu and 268 miles south-east of Bokhara.

Kabansk, a village of Russia, East Siberia, province of Transbaikalia, district of Verkhneudinsk, 275 miles west of Chita, on the lower Selenga. Owing to its position on the Amur highway, it became a wealthy spot, the inhabitants of which were engaged in the transport of tea and other goods. Population, 5000.

Kabardia, a territory of Russia, occupying the southern middle portion of North Caucasia, now part of the province of Terek. It is divided into Great and Small Kabardia, and covers about 3800 square miles, on the northern slopes of the main Caucasus range (from Mount Elbruz to Passis-mta), including the Black Mountains and the high plains on the northern slope of the latter. Before the Russian conquest it extended as far as the Sea of Azov. Its population is now about 75,000. One-fourth of the territory is owned by the aristocracy, organized in a feudal fashion, and the remainder (874,000 acres) is divided among the *auls* or villagers. A great portion is under permanent pasture, and part under forests and perpetual snow. Excellent breeds of horses are reared, and the peasants are in possession of about 117,000 horned cattle and 246,000 small cattle. The land is well cultivated in the lower parts, the chief crops being millet, Indian corn, wheat, and oats. Bee-keeping is widely spread, and Kabardian honey is in repute. Wood-cutting and the manufacture of various wooden goods, the making of *bárkas* (felt and fur cloaks), and saddlery are very general. A school for the mountaineers is kept at Nalchik, which is the chief town.

The Kabardians are a branch of the Adyghe (Teherkess). The Russians met them very early in their advance into Caucasia and the policy of Russia was always to be friendly with the Kabardian aristocracy, who were possessed of feudal rights over the Ossets, the Ingushes, the Abhazes, and the mountain Tatars, and had the command of the passages leading to Transcaucasia. John the Terrible took Kabardia under his protection. Later, Russian influence was balanced by that of the Crimea khans, but the Kabardian nobles nevertheless supported Peter I. during his Caucasian campaign. In 1739 Kabardia was recognized as free, or rather as being under the double protectorate of Russia and Turkey, but thirty-five years later it was definitively annexed to Russia, and several risings of the population in 1804 and 1822 were violently and cruelly suppressed. Russia carefully maintained the old feudal organization under which the people were governed by the *mekhemes*, or councils composed of the nobles, under the presidency of the oldest prince, who was also a *váli* (judge). But after the revolts the organization was definitively abolished in 1866, when all servile dependency of the people was terminated, and the *auls*, as well as the nobles, received regular land allotments. Besides this land there is also a reserve land, which was confiscated, but returned to the Kabardians in 1864, to form, with its revenues, "the reserve capital of the Kabardian people." Kabardia is still considered as a school of good manners in Caucasia; the Kabardian dress is the fashion of all the mountaineers. Kabardians constitute the best detachment of the personal Imperial Guards at St Petersburg. A short grammar of the Kabardian language and a Russian-Kabardian dictionary, by Lopatinsky, were published in *Sbornik Materialov dlu opisaniya Kavkaza*, vol. xii. Tiflis, 1891. Fragments of the poem "Sosyruko," some Persian tales, and the rules of Musulman religion were printed in Kabardian, in 1864, by Kazi Atazhoukin and Shardanoff. The common law of the Kabardians has been studied by Professors Maxim Kovalevsky and Vsevolod Miller. (P. A. K.)

Kabul.—The city of Kabul, the capital of Afghanistan, stands at an elevation of 6900 feet above the sea in 34° 32' N. and 69° 14' E., as determined by the surveys of the Afghan campaign of 1879–80. It lies close under the low spurs of hills to the west (the heights of Asmai, Sher Darwaza, &c.), which run to 400 feet in altitude above the city, dominating it completely, and shutting off the plains of Chardeh which stretch to the foothills of the Hindu Kush. Through these hills the Kabul river passes by the Deh Mozang gorge; and this gorge now

forms the best highway to Chardeh and Maidan. To the north, intersected by lines of low ridges and hills, are the fertile plains of the Koh Daman (reaching to Charikar) and of the Kabul river, which winds through them to a sudden descent from the eastern edge above Butkak. South of Kabul are the rugged hills which form the western buttresses of the Safed Koh range; athwart them are the narrow valleys leading to Charasia and Logar. The ancient history of Kabul and of its dynasties of Hindu and Mahomedan rulers belongs to the story of Afghanistan. Its importance as the key to northern India—as the base from which, for countless ages, invasions have been projected and carried to a successful issue, and through which irruptions from central Asia have often swept—is proved by the story of India. In the strategical geography of Asia Kabul must always have held a prominent place. It is therefore somewhat remarkable that there should be so few allusions to it by classical writers under any recognized name.

Of late years Kabul has been visited by many Europeans, some of whom have resided there for years, and have exercised definite influence in shaping the progress, and possibly the destinies, of the city. After the accession of the Amir Abdur Rahman in 1880 it underwent great changes. In 1880, when the city was still occupied by British troops, there was not much to record which differs materially from the description given by Yule in the earlier volumes (ninth edition) of this work. The Bala Hissar (the Ortospa of Alexander) was then destroyed and has never since been entirely rebuilt, and a fortified cantonment at Sherpur (one side of which was represented by the historic Bemaru ridge) has taken the place of the old earthworks of the British occupation of 1842 which were constructed on nearly the same site. The city streets were as narrow and evil-smelling, the surrounding gardens as picturesque and attractive, and the wealth of fruit was as great, as they had been fifty years previously.

The Amir, however, proved himself to be an enlightened ruler in all matters pertaining to the improvement of his capital, excepting only as regards railways and telegraphs, or any other scientific development which might lead to the introduction of a European population. He projected many roads, so that Kabul is now connected by well-planned and metalled roads with Afghan Turkestan on the west, with the Oxus and Bokhara on the north, and with India on the east. The road to India was first made by British and is now maintained by Afghan engineers. The road southwards to Ghazni and Kandahar was always naturally excellent and has probably needed little engineering, but the general principle of road-making in support of a military advance has always been consistently maintained, and the expeditions of Kabul troops to Kafristan have been supported by a very well graded and substantially constructed road up the Kunar valley from Jalalabad to Asmar, and onwards to the Bashgal valley of Kafristan. This road may yet find its terminus in Badakhshan. The city ways have been improved until it has become possible for wheeled vehicles to pass, and the various local roads connecting the suburbs and the city are always efficiently maintained. A purely local railway has also been introduced, to assist in transporting building material. The buildings erected by the Amir were pretentious, but unmarked by any originality in design and hardly worthy representations of the beauty and dignity of Mahomedan architecture. They included a new palace and a durbar hall, a bridge across the river and embankment, a pavilion and garden laid out around the site of Babar's tomb overlooking the Chardeh valley; and many other buildings of public utility connected with stud arrangements, the manufac-

ture of small arms and ammunition, and the requirements of what may be termed a wholesale shop under European direction, besides hospitals, dispensaries, bazaars, &c. The new palace is within an entrenchment just outside the city. It is enclosed in a fine garden, well planted with trees, where the harem serai (or ladies' apartments) occupies a considerable space. The public portions of the buildings comprise an ornamental and lofty pavilion with entrances on each side, and a high-domed octagonal room in the centre, beautifully fitted and appointed, where public receptions take place. The durbar hall, which is a separate building, is 60 yards long by 20 broad, with a painted roof supported by two rows of pillars. But the arrangement of terraced gardens and the lightly-constructed pavilion which graces the western slopes of the hills overlooking Chardeh are by far the most attractive of these innovations. Here, on a summer's day, with the scent of roses pervading the heated air, the cool refreshment of the passing breezes and of splashing fountains may be enjoyed by the officials of the Kabul Court, whilst they look across the beauty of the thickly-planted plains of Chardeh to the rugged outlines of Paghman and the snows of the Hindu Kush. The artistic taste of the landscape gardening is excellent, and the mountain scenery is not unworthy of Kashmir. It is pleasant to record that the graveyard of those officers who fell in the Kabul campaign of 1879-80, which lies at the northern end of the Bemaru ridge, is not uncared for. If the graves are not actually restored from time to time, they are at least protected.

Trade was apparently decreasing at the end of the century. This was doubtless due to the prohibitive transit duties levied on the Afghan frontier. Between Kabul and India in 1896-97 the exports were 151½ lakhs, and the imports 303 lakhs, showing a drop of about one-third and one-half their values respectively during the previous five years. Statistics as to population are not trustworthy, but it has been estimated at about 140,000 (1901).

See C. YATE. *Northern Afghanistan*. London, 1888.—GRAY. *At the Court of the Amir*. London, 1895. (T. H. H*.)

Kadiak (pronounced *Kad-yak'*), the largest island of Western Alaska, and also the post-office name for the chief settlement, St Paul, on Chiniak Bay, in 57° 48' N. and 152° 22' W. The name is derived from that of the Kaniak Eskimo, the original inhabitants. The settlement originated with the Russian fur-traders in 1784, and was only established by Shelikoff after severe fighting. It was the headquarters of the Russian American Company until their transfer to Sitka about 1806. St Paul is the centre of the fur trade and traffic for this district, and has a considerable commerce. Settlements on Woody Island, Afognak (the only native reservation in western Alaska), Uyak Bay with extensive salmon canneries, and Karluk, the greatest salmon fishery in the world, where more than 3,000,000 salmon have been canned in one season, employing some 1500 hands, all pay tribute in some degree to the central settlement. Ice was formerly exported to San Francisco from Woody Island, and one of the growing industries on the small islands is the rearing of foxes for their fur. The mean temperature of Kadiak is 43·3° F. The summers are warmer and more sunny, and the winters colder than at Sitka. The yearly rainfall averages 73·0 inches. The total population (1900) of St Paul and its tributary settlements is 1146 whites and 624 natives, chiefly of Eskimo stock. The wooded coast region of Alaska reaches its western limit near St Paul, the coast and islands westwards and northwards being treeless.

(W. H. D.)

Kaffraria, Kaffres.—Although possessing no official value (*Ency. Brit.* vol. xiii. p. 816), the term

Kaffraria or Kaffreland is not yet quite obsolete as a geographical expression, while it still obtains currency in popular language. But the former distinction between *British Kaffraria* and *Kaffraria Proper* ceased to have any meaning after the year 1894, when the whole region became British territory by the incorporation with Cape Colony of that portion of Pondoland which had till then enjoyed a measure of self-government. In consequence of this annexation, which had been necessitated by the constant feuds and bloodshed caused by the rivalries of native chiefs, Kaffraria now comprises the whole of the region lying between the Great Kei and Umzimkulu rivers; that is, between Cape Colony proper and Natal. For administrative purposes it is constituted in four main divisions, with areas and populations as under:—

	Area in sq. miles.	Population (1891).		
		Whites.	Natives.	Total.
Griqualand East . .	7,600	4,150	148,470	152,620
Tembuland	4,120	5,180	175,240	180,420
Transkei	2,550	1,020	152,550	153,570
Pondoland	4,040	...	166,000	166,000
Total	18,310	10,350	642,260	652,610

Griqualand East, so called to distinguish it from *Griqualand West*, which lies north of the Orange river and consequently never formed part of Kaffraria, comprises the whole of the debatable region formerly called *Noman's Land*, and afterwards named *Adam Kok's Land* from the Griqua chief who occupied it in 1862 with the consent of the British authorities. But these Griquas, from whom the district takes its present designation, are disposing of their lands to the white settlers, and are thus disappearing amongst the labouring classes. The great majority of the inhabitants are in fact no longer Griquas, but Basutos and Kaffres (Pondomisi, Ama-Baka, and other tribes). Since its annexation to Cape Colony Griqualand East has made rapid progress, and is now traversed by good roads and even telegraph lines, while the population rose from 121,000 in 1881 to over 152,000 in 1891. Stock-breeding on the uplands, tillage on the lower slopes of the Drakenberg, are the chief industries. On these slopes and uplands the climate is delightful and well suited for the European constitution.

Tembuland, which lies south-west of Griqualand East and comprises the districts of *Tembuland* proper, *Emigrant Tembuland*, and *Bomwaniland*, takes its name from the Ama-Tembu nation, popularly called Tambookies, who are one of the most powerful of all the Kaffre groups, and still number probably over 120,000 souls. In the national genealogies they hold an honourable position, being traditionally descended from Tembu, elder brother of Xosa, from whom most of the other Kaffres claim descent. Tembuland is also flourishing, and the coalfields, which appear to be extensive and easily worked, have already attracted a considerable mining population. The inhabitants, amongst whom are several thousand white settlers, increased from 160,000 to 180,000 in the decade ending 1891.

Transkei, or the *Transkei Territories*, had been completely incorporated with Cape Colony by 1885, a few years after the close of the Kaffre wars. It comprises the districts of *Fingoland*, the *Idutywa Reserve*, and *Galekaland*, this last being named from the renowned Galeka nation, who claim to be the senior branch of the Xosa family. They still form the chief element of the population, which rose from 136,000 in 1881 to nearly 154,000 in 1891. Here are some prosperous missionary stations, where the natives are taught agriculture, several mechanical industries, and even a knowledge of letters. They appear to be happy and contented under their British magistrates, who administer justice in accordance with the Native Territories Penal Code. The heroic deeds of Hinza, Kreli, and the other famous chiefs in the Kaffre wars are still remembered in the local traditions; but all desire to emulate their achievements, or to revive the superstitions associated with witchcraft, rain-making, and other pagan practices, seems to have died out.

Even more advanced in all social respects are the formerly degraded but now respected and civilized Fingos or Fengus, who give their name to the district of *Fingoland*, and also form the bulk of the population in the *Idutywa Reserve*. They have adapted themselves to Western culture almost as thoroughly as the Japanese, wearing European clothes, supporting their schools by voluntary contributions, editing newspapers, translating English poetry, setting their national songs to correct music, and on the whole conforming their lives to their Christian professions.

Since 1887 the several administrative divisions constituted out of the Transkeian Territories enjoy the franchise, with the right of returning representatives to the Cape Parliament.

See G. M'CALL THEAL. *History of South Africa, 1887-91.*—S. W. SILVER. *Handbook of South Africa, 1891.*—A. H. KEANE. *Africa*, vol. ii. 1895. (A. H. K.)

Kafiristan.—Very little of this country was known with accuracy and nothing at first hand until the late General Sir W. (then Colonel) Lockhart headed a mission to examine the passes of the Hindu Kush range in 1885-86. He penetrated into the upper part of the Bashgal valley, but after a few days he found himself compelled to return to Chitral. Previously Major Tanner, R.A., had sought to enter Kafiristan from Jalalabad, but sudden severe illness cut short his enterprise. M'Nair, the famous explorer of the Indian Survey department, believed that he had actually visited this little-known land during an adventurous journey which he made from India and through Chitral in disguise; but the internal evidence of his reports shows that he mistook the Kalash district of Chitral, with its debased and idolatrous population, for the true Kafiristan of his hopes. In 1889 Mr G. S. Robertson (afterwards Sir George Robertson, K.C.S.I.) was sent on a mission to Kafiristan. He only remained a few days, but a year later he revisited the country, staying amongst the Kafirs for nearly a year. Although his movements were hampered, his presence in the country being regarded with suspicion, he was able to study the people, and, in spite of intertribal jealousy, to meet members of many of the tribes. The facts observed and the information collected by him during his sojourn in eastern Kafiristan, and during short expeditions to the inner valleys, are the most trustworthy foundations of our knowledge of this interesting country.

Kafiristan, which literally means "the land of the infidel," is the name given to a tract of country enclosed between Chitral and Afghan territory. It was formerly peopled by pagan mountaineers, who maintained a wild independence until 1895, when they were finally subdued by Abdur Rahman, the Amir of Kabul, who also compelled them to accept the religion of Islam. The territory thus ill named is included between 34° 30' and 36° N., and from about 70° to 71° 30' E. As the western and northern boundaries are imperfectly known, its size cannot be estimated with any certainty. Its greatest extent is from east to west at 35° 10' N.; its greatest breadth is probably about 71° E. The total area approximates to 5000 square miles. Along the N. the boundary is the Amir of Kabul's Afghan Turkestan province of Badakhshan, on the N.E. the Lutkho valley of Chitral. Chitral and lower Chitral enclose it to the E., and the Kunar valley on the S.E. Afghanistan proper supplies the S. limit. The ranges above the Nijrao and Pansher valleys of Afghanistan wall it in upon the W. The northern frontier is split by the narrow Minjan valley of Badakhshan, which seems to rise in the very heart of Kafiristan. Speaking generally, the country consists of an irregular series of main valleys, for the most part deep, narrow, and tortuous, into which a varying number of still deeper, narrower, and more twisted valleys, ravines, and glens pour their torrent water. The mountain ranges of Metamorphic rock, which separate the main drainage valleys, are all of considerable altitude, rugged and difficult, with the outline of a choppy sea petrified. During the winter months, when the snow lies deep, Kafiristan becomes a number of isolated communities, with few if any means of intercommunication. In the whole land there is probably nothing in the shape of a plain. Much of the silent, gigantic country warms the heart as well as

captivates the eye with its grandeur and varied beauty; much of it is the bare skeleton of the world wasted by countless centuries of storms and frost, and profoundly melancholy in its sempiternal ruin. Every variety of mountain scenery can be found; silent peaks and hard, naked ridges, snowfields and glaciers; or mighty pine forests, wooded slopes and grazing grounds; or wild vine and pomegranate thickets bordering sparkling streams. At low elevations the hillsides are covered with the wild olive and evergreen oaks. Many kinds of fruit trees—walnuts, mulberries, apricots, and apples—grow near the villages, or by the wayside, as well as splendid horse-chestnuts and other shade trees. Higher in elevation, and from 4000 to 8000 feet, are the dense pine and cedar forests. Above this altitude the slopes become dreary, the juniper, cedar, and wild rhubarb gradually giving place to scanty willow patches, tamarisk, and stunted birches. Over 13,000 feet there are merely mosses and rough grass. Familiar wildflowers blossom at different heights. The rivers teem with fish. Immense numbers of red-legged partridges live in the lower valleys, as well as pigeons and doves. Gorgeously-plumaged pheasants are plentiful. Of wild animals the chief are the *markhor* (a goat) and the *urial* (a sheep). In the winter the former are recklessly slaughtered by hunters, being either brought to bay by trained hounds, or trapped in pits, or caught foundering in the snow-drifts; but in the summer immense herds move on the higher slopes. The *ibex* is very rare. Bears and leopards are fairly common, as well as the smaller hill creatures.

Passes and Roads.—All the northern passes leading into Badakhshan or into the Minjan valley of Badakhshan seem to be over 15,000 feet in altitude. Of these the chief are the Mandal, the Kamah (these two alone have been explored by a European traveller), the Kti, the Kulam, and the Ramgal passes. Those to the east, the Chitral passes, are somewhat lower, ranging from 12,000 to 14,000 feet, e.g., the Zidig, the Shui, the Shawal, and the Parpit, while the Patkun, which crosses one of the dwindled spurs near the Kunar river, is only 8400 feet high. Between neighbouring valleys the very numerous communicating footways must rarely be lower than 10,000, while they sometimes exceed 14,000 feet. The western passes are unknown. All these toilsome paths are so faintly indicated, even when free from snow, that to adventure them without a local guide is usually unsafe. Yet the light-framed cattle of these jagged mountains can be forced over many of the worst passes. Ordinarily the herding tracks, near the crest of the ridges and high above the white torrents, are scarcely discoverable to untutored eyes. They wind and waver, rise, drop, and twist about the irregular semi-precipitous slopes, with baffling eccentricity and abruptness. Nevertheless the cattle nose their way along blunderingly, but without hurt. Of no less importance in the open months, and the sole trade routes during winter, are the lower paths by the river. An unguided traveller is continually at fault upon these main lines of intercourse and traffic.

Rivers.—All the rivers find their tumultuous way into the Kabul, either directly, as the Alingar at Laghman, or after commingling with the Kunar at Arundu and at Chigar-Serai. The Bashgal, draining the eastern portion of the country, empties itself into the Kunar at Arundu. It draws its highest waters from three main sources at the head of the Bashgal valley. It glides gently through a lake close to this origin, and then through a smaller tarn. The first affluent of importance is the Skorigal, which joins it above the village of Pshui. Next comes the noisier Manangal water, from the Shawal pass, which

enters the main stream at Lutdeh or Bragamatal, the chief settlement of the Bashgal branch of the Katir tribe. By and by the main stream becomes, at the hamlet of Sunra, a raging, shrieking torrent in a dark narrow valley, its run obstructed by giant boulders and great tree-trunks. Racing past Bagalgrom, the chief village of the Madugal Kafirs, the river clamours round the great spur, which, 1800 feet higher up, gives space for the terraces and houses of Kamdesh, the headquarters of the Kam people. The next important affluent is the river which drains the Pittigal valley, its passes and branches. Also on the left bank, and still lower down, is the joining-place of the Gourdeh valley waters. Finally it ends in the Kunar just above Arundu and Birkot. The middle part of Kafiristan, including the valleys occupied by the Presun, Kti, Ashkun, and Wai tribes, is drained by a river variously called the Pech, the Kamah, and the Presun or Viron river. It has been only partially explored. Fed by the fountains and snows of the quinefid upper Presun valley, it is joined at the village of Shtevgrom by the torrent from the Kamah pass. Thence it moves quietly past meadowland, formerly set apart as holy ground, watering on its way all the Presun villages. Below the last of them, with an abrupt bend, it hurries into the unexplored and rockbound Tsaru country, where it absorbs on the right hand the Kti and the Ashkun and on the left the Wai rivers, finally losing itself in the Kunar, close to Chigar-Serai. Concerning the Alingar or Kao, which carries the drainage of Western Kafiristan into the Kabul at Laghman, there are no trustworthy details. It is formed from the waters of all the valleys inhabited by the Ramgal Kafirs, and by that small branch of the Katirs known as the Kulam tribe.

Climate.—The climate varies with the altitude, but in the summer time it is hot at all elevations. In the higher valleys the winter is rigorous. Snow falls heavily everywhere over 4000 feet above the sea-level. During the winter of 1890-91 at Kamdesh (elevation 6100 feet) the thermometer never fell below 17° F. In many of the valleys the absence of wind is remarkable. Consequently a great deal of cold can be borne without discomfort. The Kunar valley, which is wet and windy in winter, but where snow, if it falls, melts quickly, gives a much greater sensation of cold than the still Kafiristan valleys of much lower actual temperature. A deficiency of rain necessitates the employment of a somewhat elaborate system of irrigation, which in its turn is dependent upon the snowfall.

The Kafirs.—The present inhabitants are probably mainly descended from the broken tribes of Eastern Afghanistan, who, refusing to accept Islam (in the 10th century), were driven away by the fervid swordsmen of Mahommed. Descending upon the feeble inhabitants of the trackless slopes and perilous valleys of modern Kafiristan, themselves, most likely, refugees of an earlier date, they subjugated and enslaved them and partially amalgamated with them. These ancient peoples seem to be represented by the Presun tribe, by the slaves and by fragments of lost peoples, now known as the Jazhis and the Aroms. The old division of the tribes into the Siah-Posh, or the black-robed Kafirs, and the Safed-Posh, or the white-robed, was neither scientific nor convenient, for while the Siah-Posh have much in common in dress, language, customs, and appearance, the Safed-Posh divisions were not more dissimilar from the Siah-Posh than they were from one another. Perhaps the best division at present possible is into (1) Siah-Posh, (2) Waigulis, and (3) Presungalis or Viron folk.

The Siah-Posh.—The black-robed Kafirs consist of one very large widely-spread tribe, the Katirs, and four much smaller communities, the Kam, the Madugalis, the Kashtan, or Kashtoz, and the

Gourdesh. Numerically, it is probable that the Kafirs are more important than all the remaining tribes put together. They inhabit several valleys, each community being independent of the others, but all acknowledging the same origin and a general relationship. The Kafirs fall readily into the following groups: (a) Those of the Bashgal valley, also called Kamozi and Lutdehchis, who occupy eleven villages between Badawan and Sunra, the border hamlet of the Madugal country, namely, Ptsigrom, Pshui, or Pshowar, Ppsai, Shidgal, Bragamatal (Lutdeh), Bajindra, Badamuk, Oulagal, Chabu, Baprok, and Purstam; (b) the Kti or Katwar Kafirs, who live in two settlements in the Kti valley; (c) the Kulam people, who have four villages in the valley of the same name; (d) the Ramgalis, or Gabarikis, who are the most numerous, and possess the western part on the Afghan border. Of the remaining tribes of the Siah-Posh, the chief is the Kam, or Kamtoz, who inhabit the Bashgal valley, from the Madugal boundary to the Kunar valley, and its lateral branches in seven chief settlements, namely, Urmir, Kambrom, or Kamdesh, Mergrom, Kamu, Sarat, Pittigal, and Bazgal. The next Siah-Posh tribe in importance is the Muman, or Madugal Kafirs, who have three villages in the short tract between the Kafirs and the Kam in the Bashgal valley. The last Siah-Posh tribe is the Kashtan, or Kashtoz, who in 1891 were all located in one greatly overcrowded village, their outlying settlement having been plundered by the Afghan tribes of the Kunar valley. One colony of Siah-Posh Kafirs lives in the Gourdesh valley; but they differ from all the other tribes, and are believed to be descended, in great part, from the ancient people called the Aroms.

The Waigulis.—Our exact knowledge of the Waigulis is scanty. They seem to be related in language and origin with a people fierce, shy, and isolated, called the Ashkun, who are quite unknown. The Wai speak a tongue altogether different from that spoken by the Siah-Posh and by the Presungalis. The names of their ten chief villages are Runchi, Nishi, Jamma, Amzhi, Chimion, Kegili, Akun or Akum, Mildesh, Bargal, and Prainta. Of these Amzhi and Nishi are the best known.

The Presungalis.—The Presungalis, also called Viron, live in a high valley. In all respects they differ from other Kafirs, in none more than in their unwarlike disposition. Simple, timid, stolid-featured, and rather clumsy, they are remarkable for their industry and powers of endurance. They probably represent some of the earliest immigrants. Six large, well-built villages are occupied by them—Shtevgrom, Pontzgrom, Diogrom, Kstigrom, Satsungrom, and Paskigrom.

The Slaves.—The slaves are fairly numerous. Their origin is probably partly from the very ancient inhabitants and partly from war prisoners. Coarse in feature and dark in tint, they cannot be distinguished from the lowest class of freemen, while their dress is indistinctive. They are of two classes—household slaves, who are treated not unkindly; and artisan slaves, who are the skilled handicraftsmen—carvers, blacksmiths, bootmakers, and so forth; many of the musicians are also slaves. They live in a particular portion of a village, and were considered to a certain extent unclean, and might not approach closely to certain sacred spots. All slaves seem to wear the Siah-Posh dress, even when they own as masters the feeble Presungal folk.

Women.—Little respect is shown to women, except in particular cases to a few of advanced years. Usually they are mistresses and slaves, saleable chattels and field-workers. Degraded, immoral, overworked, and carelessly fed, they are also as a rule unpleasant to the sight. Little girls are sometimes quite beautiful, but rough usage and exposure to all weathers soon make their complexions coarse and dark. They are invariably dirty and uncombed. In comparison with the men they are somewhat short. Physically they are capable of enormous labour, and are very enduring. All the field work falls to them, as well as all kinds of inferior occupations, such as load-carrying. They have no rights as against their husbands or, failing them, their male relations. They cannot inherit or possess property.

Language.—There are certainly three tongues spoken, besides many dialects, that used by the Siah-Posh being of course the most common; and although it has many dialects, the employers of one seem to understand all the others. It is a Prakritic language. Of the remaining two, the Wai and the Presun have no similarity; they are also unlike the Siah-Posh. Kafirs themselves maintain that very young children from any valley can acquire the Wai speech, but that only those born in the Presungal can ever converse in that language, even roughly. To European ears it is disconcertingly difficult, and it is perhaps impossible to learn.

Religion.—All the Kafirs were idolaters of a rather low type. There were lingering traces of ancestor-worship, and perhaps of fire-worship also. The gods were numerous; tribal, family, household deities had to be propitiated, and mischievous spirits and fairies haunted forests, rivers, vales, and great stones. Imra was the Creator, and all the other supernatural powers were subordinate to him. Of the inferior gods, Moni seemed to be the most ancient; but Gish, the war-god, was by far the most popular. It was his

worship, doubtless, which kept the Kafirs so long independent. In life as a hero, and after death as a god, he symbolized hatred to the religion of Mahommed. Every village revered his shrine; some possessed two. Imra, Gish, and Moni were honoured with separate little temples, as was usually Dizáni goddess; but three or four of the others would share one between them, each looking out of a small separate square window. The worshipped object was either a large fragment of stone or an image of wood conventionally carved, with round white stones for eyes. Different animals were sacrificed at different shrines: cows to Imra, male goats and bulls to Gish, sheep to the god of wealth; but goats were generally acceptable, and were also slain ceremonially to discover a complaisant god, to solemnize a vow, to end a quarrel, to ratify brotherhood. The ministers of religion were a hereditary priest, a well-born chanter of praise, and a buffoon of low station, who was supposed to become inspired at each sacrifice, and to have the power of seeing fairies and other spirits whenever they were near, also of understanding their wishes. The blood of the offering, together with flour, wine, and butter, was cast on the shrine after the animal and the other gifts had been sanctified with water sprinkled by the officiating priests, while he cried "Súch, súch!" ("Be pure!"). Dense clouds of smoke from burning juniper-cedar, which crackled and gave forth pungent incense, added to the spectacle, which was dignified by the bearing of the officials and solemnized by the devout responses of the congregation. There was no human sacrifice except when a prisoner of war, after a solemn service at a shrine, was taken away and stabbed before the wooden tomb of some unavenged headman. Kafirs believed in a kind of Hell where wicked people burned; but the Hereafter was an underground region entered by a guarded aperture, and inhabited by the shapes which men see in dreams. Suicide was as unknown as fear of dying. Melancholy afflicted only the sick and the bereaved. Religious traditions, miracles, and anecdotes were puerile, and pointed no social lesson or any religious law. Music, dancing, and songs of praise were acceptable to the gods, and every village (*grom*) had its dancing platform and dancing house (*grom ma*), furnished with a simple altar. No prayers were offered, only invocations, exhortative or remonstrant.

Tribal Organization.—The great majority of the tribes were made up of clans. A person's importance was derived chiefly from the wealth of his family and the number of male adults which it contained. The power of a family, as shown by the number and quality of its fighting men as well as by the strength of its followers, was the index of that family's influence. Weak clans and detached families, of poor but free households, carried their independence modestly. The lowest clan above the slaves sought service with their wealthier tribesmen as henchmen and armed shepherds. By intricate ceremonial, associated with complicated duties, social and religious, which extended over two years, punctuated at intervals by prodigious compulsory banquets, rich men could become elders or *just*. Still further outlay and ostentation enabled the few who could sustain the cost to rank still higher as chief or *Mir*. Theoretically, all the important and outside affairs of the tribe were managed by the *just* in council; actually they were controlled by two or three of the most respected of that class. Very serious questions which inflamed the minds of the people would be debated in informal parliaments of the whole tribe. Kafirs have a remarkable fondness for discussing in conclave. Orators, consequently, are influential. The internal business of a tribe was managed by an elected magistrate with twelve assistants. It was their duty to see that the customs of the people were respected; that the proper seasons for gathering fruit were rigidly observed. They regulated the irrigation of the fields, moderating the incessant quarrels which originated in the competition for the water; and they kept the channels in good repair. Their chief, helped by contributions in kind from all householders, entertained tribal guests. He also saw that the weekly Kafir Sabbath, from the sowing to the carrying of the crops, was carefully observed, the fires kept burning, and the dancers collected and encouraged. Opposition to these annual magistrates or infraction of tribal laws was punished by fines, which were the perquisites and the payment of those officials. Serious offences against the whole people were judged by the community itself; the sentences ranged as high as expulsion from the settlement, accompanied with the burning of the culprit's house and the spoliation of his goods. In such cases, the family and the clan refusing to intervene, the offender at once became cowed into submission.

Houses and Villages.—Habitations are generally strong, and built largely of wood. They are frequently two or more storeys high, often with an open gallery at the top. Wealthy owners were fond of elaborate carving in simple designs and devices. A room is square, with a smoke-hole when possible; small windows, with shutters and bolts, and heavy doors fastened by a sliding wooden pin, are common. The nature of the ground, its defensible character, the necessity of not encroaching upon the scanty arable land, and such considerations, determine the design of the villages. Specimens of many varieties may be discovered. There is the

shockingly overcrowded oblong kind, fort-shaped, three storeys high, and on a river's bank, which is pierced by an underground way leading to the water. Here all rooms look on to the large central courtyard; outwards are few or no windows. There is also the tiny hamlet of a few piled-up hovels perched on the flattish top of some huge rock, inaccessible when the ladder connecting it with the neighbouring hillside or leading to the ground is withdrawn. Some villages on mounds are defended at the base by a circular wall strengthened with an entanglement of branches. Others cling to the knife-edged back of some difficult spur. Many are hidden away up side ravines. A few boldly rely upon the numbers of their fighting men, and are unprotected save by watch-towers. While frequently very picturesque at a distance, all are dirty and grimed with smoke; bones and horns of slaughtered animals litter the ground. The ground floor of a house is usually a winter stable for cows and the latrine, as well as the manure store for the household; the middle part contains the family treasures; on the top is the living-place. In cold valleys, such as the Presungal, the houses are often clustered upon a hillock, and penetrate into the soil to the depth of two or more apartments. Notched poles are the universal ladders and stairways.

Characteristics.—In height Kafirs average about 5 feet 6 inches. They are lean; always in hard condition; active jumpers, untiring walkers, expert mountaineers; exceptionally they are tall and heavy. With chests fairly deep, and muscular, springy legs, there is some lightness and want of power about the shoulder muscles, the arms, and the hand-grasp. In complexion they are purely Eastern. Some tribes, notably the Wai, are fairer than others, but the average colour is that of the natives of the Punjab. Albinos, or red-haired people, number less than $\frac{1}{4}$ per cent. of the population. As a rule, the features are well-shaped, especially the nose. The glance is wild and bold, with the wide-lidded, restless gaze of the hawk; or the exact converse—a shifty, furtive peer under lowered brows. This look is rather common amongst the wealthier families and the most famous tribesmen. The shape of a man's head not uncommonly indicates his social rank. Several have the brows of thinkers and men of affairs. The degraded forms are the bird-of-prey type—low, hairy foreheads, hooked noses with receding chin, or the thickened, coarse features of the darker slave class. Intellectually they are of good average power. Their moral characteristics are passionate covetousness, and jealousy so intense that it smothers prudence. Before finally destroying, it constantly endangered their wildly cherished independence. Revenge, especially on neighbouring Kafirs, is obtained at any price. Kafirs are subtle, crafty, quick in danger and resolute, as might be expected of people who have been plunderers and assassins for centuries, whose lives were the forfeit of a fault in unflinchingness or of a moment's vacillation. Stealthy daring, born of wary and healthy nerves and the training of generations, almost transformed into an instinct, is the national characteristic. Ghostly shadows, they fitted in the precincts of hostile villages far distant from their own valleys, living upon the poorest food carried in a fetid goatskin bag; ever ready to stab in the darkness or to wriggle through apertures, to slay as they slept men, women, and babies. Then, with clothing for prize, and human ears as a trophy, they sped, watchful as hares, for their far-away hills, avenger Pathans racing furiously in their track. Kafirs, most faithful to one another, never abandoned a comrade. If he were killed, they sought to carry away his head, for funeral observances. As traders, though cunning enough, they are no match for the Afghan. They were more successful as brigands and blackmailers than as skilled thieves. In night robbery and in pilfering they showed little ingenuity. Truth was considered innately dangerous; but a Kafir is far more trustworthy than his Mahomedan neighbours. Although hospitality is generally viewed as a hopeful investment, it can be calculated on, and is unstinted. Kafirs are capable of strong friendship. They are not cruel, being kind to children and to animals, and protective to the weak and the old. Family ties and the claim of blood even triumph over jealousy and covetousness.

Dress, Weapons, Utensils, &c.—The national attire of the men is a badly-cured goatskin, confined at the waist by a leather belt studded with nails, supporting the I-hilted dagger, strong but clumsy, of slave manufacture, sheathed in wood covered with iron or brass, and often prettily ornamented. Women are dressed in a long, very dark tunic of wool, ample below the shoulders, and edged with red. This is fastened at the bosom by an iron pin, a thorn, or a fibula; it is gathered round the body by a woven band, an inch wide, knotted in front to dangle down in tassels. On this girdle is carried a fantastically-handled knife in a leather covering. The woman's tunic is sometimes worn by men. As worn by women its shape is something between a long frock-coat and an Inverness cape. Its hue and the blackness of the hairy goatskin give the name of Siah-Posh, "black-robed," to the majority of the clans. The other tribes wear such articles of cotton attire as they can obtain by barter, by theft, or by killing beyond the border, for only woollen

cloth is made in the country. Of late years long robes from Chitral and Badakhshan have been imported by the wealthy, as well as the material for loose cotton trousers and wide shirts. Clothing, always hard to obtain, is precious property. Formerly little girls, the children of slaves, or else poor relations, used to be sold in exchange for clothes and ammunition. Mahomedans eagerly bought the children, which enabled them in one transaction to acquire a female slave and to convert an infidel. Men go bare-headed, which wrinkles them prematurely, or they wear Chitral caps. Certain priests, and others of like degree, wind a strip of cotton cloth round their brows. Siah-Posh women wear curious horned caps or a small square white head-dress upon informal occasions. Females of other tribes bind their heads with turbans ornamented with shells and other finery. Excellent snow gaiters are made of goat's hair for both sexes, and of woollen material for women. Boots, strongly sewn, of soft red leather cannot be used in the snow or when it is wet, because they are imperfectly tanned. For the ceremonial dances all manner of gay-coloured articles of attire, made of cheap silk, cotton velvet, and sham cloth-of-gold, are displayed, and false jewellery and tawdry ornaments; but they are not manufactured in the country, but brought from Peshawar by pedlars. Woollen blankets and goat's-hair mats cover the bedsteads—four-legged wooden frames laced across with string or leather thongs. Low square stools, 18 inches broad, made upon the same principle as the bedsteads, are peculiar to the Kafirs and their half-breed neighbours of the border. Iron tripod tables, singularly Greek in design, are fashioned in Waigul. A warrior's weapons are a matchlock (rarely a flintlock), a bow and arrows, a spear, and the dagger which he never puts aside day or night. The axes, often carried, are light and weak, and chiefly indicate rank. Clubs, carefully ornamented by carving, are of little use in a quarrel; their purpose is that of a walking-stick. As they are somewhat long, these walking-clubs have been often supposed to be leaping-poles. Swords are rarely seen, and shields, carried purely for ostentation, seldom. Soft stone is quarried to make large utensils, and great grim chests of wood become grain boxes or coffins indifferently. Prettily carved bowls with handles, or with dummy spouts, hold milk, butter, water, or small quantities of flour. Wine, grain, everything else, is stored or carried in goatskin bags. Musical instruments are represented by reed flageoles, small drums, primitive fiddles, and a kind of harp.

Peculiar Customs.—Isolated and at the outskirts of every village is a house used by women when menstruating and for lying-in. Children are named as soon as born. The infant is given to the mother to suckle, while a wise woman rapidly recites the family ancestral names; the name pronounced at the instant the baby begins to feed is that by which it is thereafter known. Everybody has a double name, the father's being prefixed to that given at birth. Very often the two are the same. There is a special day for the first head-shaving. No hair is allowed on a male's scalp, except from a 4-inch circle at the back of the head, whence long locks hang down straight. Puberty is attained ceremoniously by boys. Girls simply change a fillet for a cotton cap when nature proclaims womanhood. Marriage is merely the purchase of a wife through intermediaries accompanied by feasting. Divorce is often merely a sale or the sending away of a wife to slave for her parents in shame. Sexual morality is low. Public opinion applauds gallantry, and looks upon adultery as hospitality, provided it is not discovered by the husband. If found out, *in flagrante delicto*, there is a fiscal fine in cows. There is much collusion to get this penalty paid in poor households. Funeral rites are most elaborate, according to the rank and warrior fame of the deceased, if a male, and to the wealth and standing of the family, if a woman. Children are simply carried to the cemetery in a blanket, followed by a string of women lamenting. A really great man is mourned over for days with orations, dancing, wine-drinking, and food distribution. Gun-firing gives notice of the procession. After two or three days the corpse is placed in the coffin at a secluded spot, and the observances are continued with a straw figure lashed upon a bed, to be danced about, lamented over, and harangued as before. During regular intervals for business and refreshment old women wail genealogies. A year later, with somewhat similar ritual, a wooden statue is inaugurated preliminary to erection on the roadside or in the village Valhalla. The dead are not buried, but deposited in great boxes collected in an assigned place. Finery is placed with the body, as well as vessels holding water and food. Several corpses may be heaped in one receptacle, which is, rarely, ornamented with flags; its lid is kept from warping by heavy stones. The wooden statues or effigies are at times sacrificed to when there is sickness, and at one of the many annual festivals food is set before them. Among the Presungal there are none of these images. Blood-feuds within a tribe do not exist. The slayer of his fellow, even by accident, has to pay a heavy compensation or else become an outcast. Several hamlets and at least one village are peopled by families who had thus been driven forth from the community. The stigma attaches itself to children and their marriage connexions. Its outward symbol is an inability to look in the face any of the dead person's

family. This avoidance is ceremonial. In private and after dark all may be good friends after a decorous interval. The compensation is seldom paid, although payment carries with it much enhancement of family dignity. All the laws to punish theft, assault, adultery, and other injury are based on a system of compensation whenever possible, and of enlisting the whole of the community in all acts of punishment. Kafirs have true conceptions of justice. There is no death penalty; a fighting male is too valuable a property of the whole tribe to be so wasted. War begins honourably with proper notice, as a rule, but the murder of an unsuspecting traveller may be the first intimation. Bullets or arrow-heads sent to a tribe or village is the correct announcement of hostilities. The slaying of a tribesman need not in all cases cause a war. Sometimes it may be avoided by the sinning tribe handing over a male to be killed by the injured relations. Ambush, early morning attacks by large numbers, and stealthy killing parties of two or three are the favourite tactics. Peace is made by the sacrifice of cows handed over by the weaker tribe to be offered up to a special god of the stronger. When both sides have shown equal force and address, the same number of animals are exchanged. Field work falls exclusively to the women. It is poor. The ploughs are light and very shallow. A woman, who only looks as if she were yoked with the ox, keeps the beast in the furrows, while a second holds the handle. All the operations of agriculture are done primitively. Grazing and dairy-farming are the real trade of the Kafirs, the surplus produce being exchanged on the frontier or sold for Kabul rupees. Herders watch their charges fully armed against marauders.

See ROBERTSON. *Kafirs of the Hindu-Kush*. London, 1896.
(G. S. R.)

Kagalnik, a town of south-east Russia, province of Don Cossacks, 27 miles south-west of Rostov. It has important fairs, and trade in horses, cattle, and fish. *Kagalnitskiy kut* is the name given to the north-east littoral of the Sea of Azov, renowned for its fisheries. Population, 14,000.

Kahlur, or **BILASPUR**, a native state of India, within the Punjab, one of the hill states that came under British protection after the first Sikh war in 1846. It occupies part of the basin of the Sutlej, amid the lower slopes of the Himalaya. Area, 451 square miles. The population in 1881 was 86,546; in 1891, 91,760; average density, 203 persons per square mile; estimated gross revenue, Rs.1,57,000; tribute, Rs.8,000; military force, 1021. The chief, whose title is *raja*, is a Chandeli Rajput. The present *raja* (1902) is distinguished for his successful administration. The town of **BILASPUR** is situated in 31° 19' N. lat., and 76° 50' E. long., on the left bank of the Sutlej, which is here crossed by a bridge, 1465 feet above the sea.

Kaira, or **KHEDA**, a town and district of British India, in the Gujarat division of Bombay. The town is 20 miles north-west of Ahmedabad, and 5 miles from a railway station. Population (1881), 12,640; (1891), 10,101. There are two printing-presses, each issuing a vernacular newspaper; a brass foundry; and a creamery with 36 separators. The district has an area of 1609 square miles. The population in 1881 was 804,800; in 1891, 871,589, showing an increase of 8 per cent.; average density, 542 persons per square mile, being considerably the highest in the province. In 1901 the population was 715,725, showing a decrease of 18 per cent., due to the results of famine. The land revenue was Rs.21,39,700, the incidence of assessment being Rs.3:13:5 per acre; cultivated area (1897-98), 639,572 acres, of which 38,011 were irrigated from wells, &c., including 1126 acres from Government canals; number of police, 707; children at school (1897-98), 29,497, being 3.5 per cent. of the total population; registered death-rate (1897), 28.48 per thousand. The principal crops are cotton, millets, rice, and pulse; the manufactures are of cotton cloth, calico-printing, dyeing, soap, and glass. The chief centre of trade is Nariad, on the railway, with a cotton mill. The Bombay and Baroda railway runs through the district for 72 miles. A special article of export is *ghi*,

or clarified butter. The famine of 1899-1900 was felt more severely here than in any other part of the province, the loss of cattle being specially heavy.

Kaiserslautern, a town of Bavaria, Germany, in the Palatinate, 41 miles by rail west of Mannheim. It has a couple of technical schools, school of architecture, and agricultural school. It has developed considerable industrial activity in cotton spinning and weaving, factories for sewing-machines, brewing, brickworks, railway works, sawmills, iron works and foundries, and the manufacture of calico and wooden wares. Population (1885), 31,449; (1900), 48,306.

Kalach, a Cossack village of south-east Russia, province of the Don, chief river port on the Don, 31 miles north-east of Nijne-Chirskaya, at the place where the Don approaches nearest the Volga. Its permanent population, which numbers but a few thousands, much increases in summer. It is the terminus of the 50-miles railway which connects the Don with Tsaritsyn on the Volga, and all the goods which are brought from the Caspian Sea up the Volga and are destined for middle Russia, or for export through the Sea of Azov, are unloaded at Tsaritsyn and sent over to Kalach on the Don, to be shipped either up or down the Don or to be sent to middle Russia by rail. Large quantities of fish, from the lower Volga, Ural, and Caspian fisheries, are sent on this route. Naphtha, which comes from Baku, is pumped at Tsaritsyn from the ships to cistern-waggons and brought partly to Kalach. Finally, corn and timber, which are shipped down the Volga, are also sent from Tsaritsyn to Kalach to be shipped thence south-westwards. Nearly 460,000 tons reach Kalach to be distributed every year, giving employment to from 150 to 300 vessels; corn alone represents an item of 370,000 tons.

Kalahandi, or **KAROND**, a feudatory state of India, in the Chhattisgarh division of the Central Provinces. Area, 3745 square miles; population (1881), 224,548; (1891), 326,295; average density, 87 persons per square mile. In 1901 the population was 336,961, showing an increase of 3 per cent., compared with an apparent increase of 45 per cent. in the previous decade. The estimated revenue is Rs.1,55,000; tribute, Rs.12,000. The chief, who is a Rajput, is the only one in the Central Provinces entitled to a salute of 9 guns, which he received at the Delhi durbar in 1877. The present (1901) chief is a minor, and the state is under British administration. The inhabitants mostly belong to the aboriginal race of Kandhs. A murderous outbreak against Hindu settlers called for armed intervention in 1882.

Kalamata, a town in the Morea, Greece, 17 miles west by south of Sparta, in the province of Messenia, about a mile from the sea. The harbour, though recently improved, offers little shelter to shipping. Vessels load and discharge by means of lighters, the outer harbour having a depth at entrance of 24 feet and inside of 14 feet. The inner harbour has a depth of 15 feet, and is sheltered by a breakwater 1640 feet in length. The silk industry, formerly important, still employs about 300 women and girls in four spinning establishments. Olive oil and silk are the chief exports. Population (1889), 10,696; (1896), 14,298.

Kalamazoo, capital of Kalamazoo county, Michigan, U.S.A., on the Kalamazoo river, at an altitude of 760 feet. It has a fairly level site and a regular plan, is divided into five wards, and has a good water-supply by the Holly pumping system. The river furnishes water power for manufactures, which in 1890 had a capital of \$4,000,000, employed over 5000 hands, and had a product valued at \$6,000,000. It is at the intersection of four railways, the

Chicago, Kalamazoo, and Saginaw, the Grand Rapids and Indiana, the Lake Shore and Michigan Southern, and the Michigan Central. Kalamazoo is the seat of Kalamazoo College, a Baptist institution, founded in 1855, which had in 1899 fourteen instructors and 241 students, 94 of whom were women. One of the state insane asylums is located here. Population (1890), 17,853; (1900), 24,404, of whom 4710 were foreign-born and 471 negroes.

Kalát (*Khalat*), capital of Baluchistan, situated in 29° 2' N. and 66° 37' E., about 6780 feet above sea-level. The word Kalát is derived from *kala*—a fortress—and Kalát is the most picturesque and most impressive fortress to be found in the Baluch highlands. It crowns a low hill, round the base of which clusters the closely-built mass of flat-roofed mud houses which form the insignificant town. Kalát as a capital and the residence of the chief of Baluchistan has long been eclipsed in importance by Quetta, about 90 miles to the north, the residence of the agent to the Governor-General of India. There is a population of 7000 to 8000 people within the town walls of Kalát. The valleys immediately surrounding the prettily situated fortress are well cultivated and thickly inhabited, in spite of their elevation and the extremes of temperature to which they are exposed. Recent surveys of Baluchistan have determined the position of Khozdar (27° 48' N., 66° 38' E.) about 50 miles south of Kalát. Khozdar was the former capital of Baluchistan, and is as directly connected with the southern branches of the Mulla pass as Kalát is with the northern, the Mulla being the ancient trade route to Gandava (Kandabel) and Sind. In spite of the rugged and barren nature of the mountain districts of the Kalát highlands, the main routes through them (concentrating on Khozdar rather than on Kalát) are comparatively easy. The old "Pathan vat," the trade highway between Kalát and Karachi by the Hab valley, passes through Khozdar. From Khozdar another route strikes a little west of south to Wad, and then passes easily into Las Bela. This is the "Kohan vat." A third route runs to Nal, and leads to the head of the Kolwah valley (meeting with no great physical obstruction), and then strikes into the open highroad to Persia. Some of the valleys about Kalát (Mastang, for instance) are wide and fertile, full of thriving villages and strikingly picturesque; and in spite of the great preponderance of mountain wilderness (a wilderness which is, however, in many parts well adapted for the pasturage of sheep) existing in the Sarawan lowlands almost equally with the Jalawan highlands, it is not difficult to understand the importance which the province of Kalát, anciently called Turán (or Tubarán), maintained in the eyes of mediæval Arab geographers (see BALUCHISTAN). New light has been thrown on the history of Kalát by the translation of an unpublished manuscript obtained at Tatta by Mr G. P. Tate, of the Indian Survey Department, who has added thereto notes from the Tufhat-ul-Kiráń, for the use of which he was indebted to Khan Sahib Rasul Baksh, mukhtiádar of Tatta. According to these authorities, the family of the khans of Kalát is of Arabic origin, and not, as is usually stated, of Brahuic extraction. They belong to the Ahmadzai branch of the Mirwari clan, which originally emigrated from Oman to the Kolwah valley of Makráń.

See Mr Tate's pamphlet, published in Calcutta in 1896.

(T. H. H*.)

Kalgoorlie, a thriving town of West Australia, 24 miles east-north-east of Coolgardie by rail. Good water was struck in 1896. The gold-field here is a rich one, supporting about 15,000 miners. Population, 6583.

Kalisz, a government of Russian Poland, having Prussia on the W. and N.W., and the governments of

Warsaw and Piotrków on the E. and S. Its area occupies 4392 square miles. Its surface is a lowland, sloping towards the west, and is watered by the Prosna and the Warta and their numerous small tributaries, as also the Bzura. It was formerly covered with countless small lakes and thick forests, now mostly destroyed. Many small lakes and large marshes exist still. Its population was 846,719 in 1897 (427,978 women), of whom 113,609 lived in towns. They are chiefly Poles. The vast majority of the people are Roman Catholics, but the Jews and Protestants each number some 80,000. The land is divided among 80,000 owners (including 142 village communities), the subdivision of land rapidly progressing, and its market value growing steadily. In 1900, 109,100 acres were under crops, and 230,000 under forests. Agriculture is carried on to perfection on a number of estates, as also cattle-breeding. There were in 1897, 92,098 horses, 261,046 horned cattle, and over 1,104,000 sheep, out of which about 600,000 were of finer breeds. A variety of domestic trades, including the weaving of linen and wools, is carried on in the villages. There are various factories, the joint output of which is valued at two millions sterling. The government is divided into eight districts, the chief towns of which are: Kalisz (21,680 inhabitants), Koń (9400), Konin (8530), Łęczyca (8863), Słupiec (3758), Sieradz (7019), Turek (8141), and Velun (7442).

Kalisz, chief town of the above province, situated in the low valley of the Prosna, 148 miles west-south-west of Warsaw, near the Prussian frontier. Population (1897), 21,680, of whom 48 per cent. were Catholics, 37 per cent. Jews, and 11 per cent. Protestants. Several factories (sugar, woollen cloth, woollens, ribbons, &c.), with an aggregate return of £300,000 are situated in the town and its suburbs.

Kalitvenskaya, a Cossack village of Russia, province of the Don, 7 miles east-south-east of Kamenskaya, on a tributary of the Donets. Good sandstone is extracted in considerable quantities. Population, 20,025.

Kalk, a town of Prussia, in the Rhine province, 2 miles east of Cologne. It has various iron and chemical industries, brickworks, and breweries. Population (1885), 11,418; (1900), 20,581.

Kalmyk, or KALMUCK STEPPE, a territory or reservation belonging to the Kalmyks, having a quadrilateral shape and limited by the Volga on the N.E., and the Manych (West Caucasia) on the S.W., the Caspian Sea on the S.E., and the province of the Don Cossacks on the N.W. Its area covers 36,900 square miles, to which a second reservation (1,955,000 acres), on the left bank of the lower Volga, must be added. According to Mushketoff, the Kalmyk Steppe must be divided into two parts, western and eastern. The former, occupied by the Ergheni Hills, is a deeply ravined plain, 300 and occasionally 630 feet above the sea. It is built up of Tertiary deposits, of the Sarmatian division of the Miocene period, covered with loess and black earth, and its escarpments represent the old shoreline of the Caspian. No Caspian deposits are found on or within the Ergheni Hills. The flora of these hills is the usual black earth flora, and they have a settled population. The eastern part is a low plain lying for the most part from 30 to 40 feet below the level of the sea, gently sloping from Sarepta to the Volga. Post-Pliocene "Aral-Caspian deposits," containing the usual fossils (*Hydrobia*, *Neritina*, eight species of *Cardium*, two of *Dreissena*, three of *Adacna* and *Lithoglyphus caspius*), attain varying thicknesses from 105 feet to 7 or 10 feet, and disappear in places. Lacustrine and fluvial deposits are found mixed with the above. Large tracts of moving sands are spread about Enotævsk, where high dunes or *barkhans* have been formed. A narrow tract of land along the north-west coast of the Caspian,

described as *mochaghi* by the Russians, and known in geography as the "hillocks of Baer," is covered with hillocks elongated from west to east, perpendicularly to the coast-line, the spaces between these mounds being filled with water or covered with thickets of rushes, as well as with thickets of *Salix*, *Ulmus campestris*, almond trees, &c. Quite an archipelago of little islands is formed close to the littoral by these mounds, which have on the north and north-west a succession of salt lakes partly desiccated. Small streams originate in the Erghenis, but are lost as soon as they reach the low land, where water can only be obtained from wells, while the scanty vegetation becomes a mixture of the flora of south-east Russia and of the deserts of Central Asia. The steppe is divided into eight *uluses*, and has a total population of 27,713 *kibitkas*, or felt tents, and 109,620 souls. There are no less than 62 Buddhist monasteries and 965 lamas for that population. Part of the Kalmyks are settled (chiefly in the hilly parts), the remainder being nomads. They have over 50,000 horses, 180,000 cattle, and half a million sheep, but suffer heavy losses from murrain. Some attempts at agriculture and tree-planting on a small scale are being made. Cattle-breeding, fishing, and some domestic trades, chiefly carried on by women, are the main sources of living. The steppe is intersected in all directions by paths, and communication is everywhere easy.

Prof. MUSHKETTOFF. *Geol. Researches in the Kalmyk Steppe in 1884-85*. St Pet., 1894 (Russian).—KOSTENKOFF'S works (1868-70); and a great number of earlier works enumerated in P. SEMENOFF'S *Geogr. Dictionary and Russ. Encycl. Dict.* (P. A. K.)

Kalnoky, Gustav, COUNT (1832-1898), Austrian statesman, was born at Lettowitz, in Moravia, of an old Transylvanian family. After spending some years in the army, in 1854 he entered the diplomatic service; was for the ten years 1860 to 1870 secretary of Legation at London, and then, after serving at Rome and Copenhagen, was in 1880 appointed ambassador at St Petersburg. The ability he showed in this important post, especially, it is said, in the despatches he sent home, attracted the attention of the Emperor, and on the death of Baron v. Haymerle in 1881 he was appointed Minister of Foreign Affairs for Austria-Hungary, and held this post for fourteen years. Essentially a diplomatist, he took little or no part in the vexed internal affairs of the empire, and he was little heard of in public except at the annual statement on foreign affairs before the Delegations. His management of the affairs of his department was, however, very successful: he confirmed and maintained the alliance with Germany which had been formed by his predecessors, and co-operated with Bismarck in the arrangements by which Italy joined the alliance. Kalnoky's special influence was seen in the improvement of Austrian relations with Russia, which followed the meeting at Skiernevice at which he was present, a policy which caused some adverse criticism in Hungary. His friendliness for Russia did not, however, prevent him from strengthening the position of Austria in the Balkan peninsula and establishing a closer political and commercial understanding with Servia and Rumania. In 1885 he interfered after the battle of Slivnitsa to arrest the advance of the Bulgarians. Though he kept aloof from the Clerical party, Kalnoky was a strong Catholic; and his sympathy for the difficulties of the Church caused some adverse comment in Italy, when, in 1891, he stated in a speech that the question of the position of the Pope was still quite unsettled. He explained that by this he did not refer to the Roman question, which was of course permanently settled, but to the possibility of the Pope leaving Rome. It was the jealousy felt in Hungary against the Ultramontanes which led to his fall. In 1895 a case of clerical aggression by

Agliardi, the Nuncio in Hungary, aroused a strong protest in the Hungarian parliament, and Banffy, the Hungarian minister, expressed himself in such a way as to trespass on the functions of the foreign minister. Kalnoky therefore offered his resignation, which, after some delay, the Emperor was obliged to accept. He died on the 13th of February 1898.

Kalpi, or CALPEE, a town of British India, in the Jalaun district of the North-West Provinces, on the right bank of the Jumna, 45 miles south-west of Cawnpore. Population (1891), 12,713; municipal income (1897-98), Rs.14,368. It is still a centre of local trade, with a station on the Indian Midland railway from Jhansi to Cawnpore, which here crosses the Jumna. There are manufactures of sugar and paper, and a municipal school.

Kaluga, a province of middle Russia, with an area of 11,942 square miles. Its surface is an undulating plain, 800 to 900 feet in its highest parts in the south-west, and deeply ravined, especially in the north-east. It is built up mainly of Carboniferous deposits—upper, middle, and lower (coal-bearing), with patches of the soft Jurassic clays and limestones which formerly covered them. Cretaceous deposits (phosphorites) occur in the south-west, and Devonian limestones and shales creep out in the south-east. It is covered with a thick layer of boulder clay in the north, with vast ridges and fields of boulders brought by the ice-sheet from Finland and Olonets; large areas are strewn with flint boulders in its middle parts, and patches of loess are seen farther south. Iron ores are the chief mineral wealth, 30,000 tons of cast-iron being obtained, and nearly 40,000 persons being engaged in mining. Beds of coal are known in several places, and some of them are worked. Fireclay, china-clay, chalk, grindstone, pure quartz sand (for glass), phosphorite, and copper are also extracted. Forests cover 19 per cent. of the surface, but are distributed very unequally, chiefly in the south. The soil, which is rather unfertile, is not very suitable for agriculture, and owing to a rather dense population, considerable numbers of the inhabitants find occupation in industry, or as carriers and carpenters who work for one half of the year at the Black Sea ports.

The population (1,025,705 in 1860) was 1,185,726 in 1897, nearly all Great Russians. There are 116 women to 100 men, 94,853 living in towns. Of the 7,663,000 acres of available land, 4,072,700 acres were owned by the peasant communities, 2,993,300 acres by private owners, and 249,500 by the Crown. The chief crops are rye, oats, barley, sarrazin, and potatoes. Hemp is grown for local use and export. There were in 1892, 417 factories, employing 14,520 persons, and showing an annual output valued at about 16,500,000 roubles. The chief items of industry are distilleries, iron works, woollen cloth, cottons, paper, matches, leather, china, steam flour-mills, and oil works. Large quantities of all sorts of wooden goods are fabricated in the villages of the south. A considerable trade is carried on in hemp, hempseed, and hempseed oil, corn and hides; and iron, machinery, leather, glass, chemicals, and linen are exported. The schools are very insufficient (853), and there were in them 38,325 boys and only 9590 girls. Owing to the great number of Nonconformists, many children are taught in private peasant schools. The province is divided into 11 districts: Kaluga, Borovsk (8407 inhabitants), Kozelsk (5908), Likhvin (1776), Maloyaroslavets (2500), Medyń (4392), Meshchovsk (3667), Mosalsk (2652), Peremyshl (3956), Tarusa (1989), and Zhizdra (5996). Several villages, such as Ludinovo, Polotmyanyi Zavod, and several others, are more populous than the above towns. KALUGA, the capital, is situated on the Oka, 149 miles south-west of Moscow, and is connected by rail with Vyazma (103 miles) and Tula (81 miles). Population (1862), 37,918; (1897), 49,728.

Kalusz, a district town and trading centre in south-eastern Galicia, Austria, on the Lomnicza, a tributary of the Dniester. It has large salt works, and a considerable timber, corn, and cattle trade. Population (1890); 7526; (1900), 7821.

Kamchatka, a large peninsula of north-east Asia, in the northern Pacific, stretching from the Land of the

Chukchis in a southern direction for 850 miles, with a width of from 70 to 250 miles (51° to 60° N., and 156° to 164° 20' E.), between the Sea of Okhotsk and Bering Sea, forming part of the Russian Maritime Province (*Primorskaya Oblast*), with an area of 104,260 square miles.

The orography is not yet fully known, but the ridge which is drawn on many maps, from the Land of the Chukchis to the southern extremity of the peninsula, does not exist. From 59° 40' N. to 62° N. the isthmus which connects the peninsula with the mainland is a flat *tundra*, gently sloping both ways (Ditmar, Bogdanovich, Kennan). As to the ridge, which Ditmar called central, it seems to be interrupted under 57° N. by a deep indentation corresponding to the valley of the Tighil, where the hydrographical net, as well as the south-west to north-east stretching of the clay-slates and Metamorphic schists on Ditmar's map, seems rather to indicate the existence of two chains running south-west to north-east, parallel to the volcanic chain of south-east Kamchatka. Glaciers were not known till the year 1899, when they were discovered by an expedition on the Byelaya and Ushkinskaya mountains. They are small, but formerly had a much greater extension. Thick Tertiary deposits, probably Miocene, cover the middle portions of the west coast. The southern parts of the central ridge are composed of granites, syenites, porphyries, and crystalline slates, while in the north of Ichinskaya volcano, which is the highest summit of the peninsula (16,920 feet), the mountains consist chiefly of Tertiary sandstones and old volcanic rocks. Coal-bearing clays, containing fresh-water molluscs and dicotyledonous plants, as also conglomerates, alternate with the sandstones in these Tertiary deposits. Amber is also found in them. Very extensive layers of melaphyre and andesite, as also of conglomerates and volcanic tuffs, cover the middle portions of the peninsula. The south-eastern portion is occupied by a range of volcanoes, both active and extinct, running south-west to north-east along the indented coast, from Cape Lopatka to Cape Kronotskiy (54° 25' N.), and separated from the rest of the peninsula by the valleys of the Bystraya (west coast) and the Kamchatka river. Another chain of volcanoes runs from Ichinskaya (which burst into activity several times in the 18th and 19th centuries) to Shiveluch, seemingly parallel to the above, but to the north of it. The two chains contain twelve active and twenty-six extinct volcanoes, from 7000 to more than 15,000 feet high. The highest volcanoes are grouped under the 56th degree of latitude, and the highest of them, Kluchevskaya (16,032 or 16,500 feet), is in a state of almost continuous activity, a flow of its lava having reached to Kamchatka river in 1853. The active Shiveluch (9898 feet) is the last volcano of this row. Several lakes and probably Avacha Bay are old craters. Copper, mercury, and iron ores, as also pure copper, ochre, and sulphur, are found in the peninsula. The main river is the Kamchatka (about 325 miles long), which flows first north-eastwards in a fertile longitudinal valley, and then, bending suddenly to the east, pierces the above-mentioned volcanic ridge. The other rivers are the Tighil (135 miles) and the Bolstraya (120 miles), both flowing into the Sea of Okhotsk; and the Avacha, flowing into the Pacific; and the Zhupanova. The floating ice which accumulates in the northern parts of the Sea of Okhotsk and the cold current which flows along the east coast of the peninsula render its summers cold, but the winter is relatively warm, and temperatures below -40° Fahr. are only found in the highlands of the interior and on the Okhotsk littoral. The average temperatures at Petropavlovsk (53° N.) are: year 36° Fahr., January 17°, July 58°; while in the valley of the Kamchatka the average temperature of the winter is 16°, and of the summer as high as 58° and 64°. The rains and snow are copious, and dense fogs clothe the coast in summer; consequently the mountains are well covered with wood and the meadows with grasses, except in the *tundras* of the north. The coasts are rich in *Delphinopterus leucus*, *Otaria Stelleri*, and walrus. The sea-otter (*Enhydria marina*) has been destroyed. The population, which numbered 7331 in 1853 and 5846 in 1870, was 7199 in 1888. The southern part of the peninsula is occupied by Kamchadales, who have many features of the Mongolian race, but are more similar to the aborigines of north-east Asia and north-west America. Dr Dybowski found them rather good-looking, and with less flat faces and less prominent cheek-bones than Siberian aborigines. Steller and Krashenninikoff, who visited Kamchatka in the 18th century, found the Kamchadales still in the mode of life of the Stone Age. They have since taken to the Russian mode of living. Fishing (quantities of salmon enter the rivers) and hunting are their chief occupation. The efforts of the Government to introduce cattle-breeding have failed, there being in 1889 only 655 horses, 1832 cattle, and 43,300 reindeer. Beyond the 57th degree the peninsula is peopled with Koryaks, settled and nomads, and Lamuts or Tunguses, who came from the west coast of the Sea of Okhotsk. The chief Russian settlements are: Petropavlovsk, on the east coast, on Avacha Bay (53° N. and 158° 44' E.), excellent roadstead; Verkhe-Kamchatsk and Nijne-Kamchatsk, in the

valley of the Kamchatka river; Bolsberyetsk, on the Bolstraya; and Tighil. All goods, except rye, flour, and tobacco, are imported from San Francisco. The trade is nearly all by barter.

LITERATURE.—See, besides the works mentioned in the earlier volumes, C. von DITMAR'S "Reisen und Aufenthalt in Kamchatka in den Jahren 1851-1855," in *Beiträge zur Kenntniss des Russischen Reichs*, 3te Folge, Bd. vii.—K. DIENER, in *Petermann's Mitteilungen*, 1891, Bd. xxxvii.—OBRUCHEFF, in *Izvestia of the East Siberian Geographical Society*, vol. xxiii. pp. 4, 5, 1892.—GUILLEMAN. *Cruise of the "Marchesa."* (P. A. K.)

Kamenets Podolsk, a town of south-west Russia, chief town of the government of Podolia, 876 miles south-west of Moscow, near the Austrian frontier, 3 miles from the railway terminus of the south-western railways. An interesting archæological museum for church antiquities was founded in 1890. Population (1863), 20,699; (1897), 34,383.

Kamenskaya, a district town of Russia, province of the Don, on the northern Donets, 66 miles by rail north of Novocherkassk. It is one of the richest places in the province, owing to the neighbouring coal mines, and has also tanneries and oil works, as well as trade in cattle and grain. Population (1897), 23,576.

Kamerun. See CAMEROON.

Kampti, or KAMTHI, a town of British India, in the Nagpur district of the Central Provinces, just below the confluence of the Kanhan with the rivers Pench and Kolar; 1019 feet above the sea; 8 miles north-east of Nagpur by rail. Population (1881), 50,987; (1891), 43,159. Kampti is well laid out with wide roads, gardens, and tanks. It is the headquarters of a military district, though the garrison is now much reduced, consisting of a battery of artillery, a European and a Madras native infantry regiment. It is an important centre of trade, especially since the opening of the Bengal-Nagpur railway, which here crosses the Kanhan river by a fine iron-girder bridge. There are two steam factories for ginning and pressing cotton. The Roman Catholic convent school had 11 boys and 125 girls in 1896-97.

Kamrup, a district of British India, in the Brahmaputra valley division of Assam. The headquarters are at Gauhati, the former capital. Area, 3660 square miles; in 1881 the population was 644,960; in 1891, 634,249, showing a small decrease; average density, 173 persons per square mile, being the highest in the Brahmaputra valley. Classified according to religion, Hindus numbered 445,377; Mahomedans, 55,350; hill tribes, 131,759; Christians, 948, of whom 42 were Europeans; "others," 815. In 1901 the population was 589,303, showing a further decrease of 7 per cent., which may be ascribed to the prevalence of a malignant type of fever. The land revenue was Rs.13,88,194, the incidence of assessment being Rs.2:8:2 per acre; number of police, 304; number of boys at school (1896-97), 12,185, being 25.3 per cent. of the male population of school-going age; registered death-rate (1897), 46.19 per thousand. In 1897 the number of tea gardens was 31, with 5873 acres under tea, employing 3959 persons, of whom 1211 were children, and producing an out-turn of 753,228 lb, or at the rate of 1.32 lb per acre. A section of the Assam-Bengal railway, which will ultimately be continued across the hills, starts from Gauhati. In 1896 about 75 miles of this section were open, but had to be closed owing to the damage caused by the earthquake of 12th June 1897, which was estimated at Rs.6,55,000. In 1899 it was reopened to a farther length of 93 miles in all. A metalled road runs due south from Gauhati to Shillong (63 miles), which was also seriously damaged by the earthquake. A ferry across the Brahmaputra at Gauhati is worked by a Government steamer.

Kamyshin, a district town of Russia, government and 120 miles south-south-west of Saratoff, on the right

bank of the Volga. Being the terminus of the railway to Tamboff, Moscow, and the Baltic ports, it is an important port for the export of corn and salt from the Volga, and imports timber and wooden goods. Population (1861), 8644; (1897), 15,934.

Kanara, or CANARA, the name of two districts of British India—North Kanara attached to Bombay, South Kanara to Madras. NORTH KANARA district forms part of the Konkan division of Bombay. The administrative headquarters are at Karwar, which is also the chief seaport. Area, 3910 square miles; population (1881), 421,840; (1891), 446,351, showing an increase of nearly 6 per cent.; average density, 114 persons per square mile, being the lowest in the Presidency. In 1901 the population was 454,238, showing a further increase of 2 per cent. The land revenue and rates were Rs.11,08,400, the incidence of assessment being nearly Rs.3 per acre; number of police, 702; children at school, 11,358, being 2.6 per cent. of the population; death-rate (1897), 36 per thousand. The Bombay survey tenure has not been fully extended to North Kanara, so that agricultural statistics are not available. Forests cover no less than 3794 square miles. The trade of the interior, which used to pass down to the seaports, has now been largely diverted by the opening of the Southern Mahratta railway. SOUTH KANARA district has its headquarters at Mangalore. Area, 3902 square miles; population (1881), 959,514; (1891), 1,056,081, showing an increase of 10 per cent.; average density, 271 persons per square mile. In 1901 the population was 1,134,624, showing a further increase of 7 per cent. The land revenue and rates (1897-98) were Rs.15,27,035, the rate of assessment being nearly Rs.3 per acre; number of police, 609; children at school (1896-97), 27,010, being 1 in 39 of the total population; death-rate (1897), 28 per thousand. The one staple crop is rice. The Madras *rayatwari* system has not been extended to South Kanara, where land is treated as private property, subject to a traditional assessment. Tiles are manufactured in several places out of a fine potter's clay. In 1897-98 the total seaborne trade was valued at Rs.1,77,04,146, of which nearly one-third was with foreign countries.

Kandahar.—Since the withdrawal of the British army of occupation from southern Afghanistan, at the close of the Afghan war of 1878-80, no important information (other than that which is supplied by a native agent to the Indian political department) has been gathered about Kandahar. The close of the Russo-Afghan Boundary Commission in 1887 afforded an opportunity for surveying the country bordering the Helmand which lies beyond Kandahar, on the road to Farah and Herat. This district, known as Zamindawar, is very highly cultivated and thickly populated, and it is here that the most turbulent and most fanatical of Afghan tribesfolk (Achakzais and Nurzais of the Durani clans) are mostly gathered. To the south those routes which connect the city with the coast of southern Baluchistan and Karachi have been carefully surveyed, but of the city itself nothing more is known than has already been included in the description given of it in the earlier volumes of this work. Trade statistics of late years show a gradual increase of exports to India from Kandahar and the countries adjacent thereto, but a curious falling-off in imports. The exports in 1899-1900 amounted to about Rs.43,24,772 in value, but the imports, Rs.28,18,412, contrasted unfavourably with those of 1894-95. The short-sighted policy of the Amir Abdur Rahman in discouraging imports doubtless affected the balance, nor did his affectation of ignoring the railway between New Chaman and Kila Abdulla (on the Peishin

side of the Kojak) conduce to the improvement of trade. (Т. Н. Н*.)

Kandy, a town near the centre of Ceylon, 75 miles from Colombo by rail. It has been greatly improved. Governor Sir William Gregory did much to restore the ancient Kandy decorations, while the Victoria Jubilee Commemoration Building, including "Ferguson Memorial Hall," and two fine hotels, add to the improvements. The Royal Botanic Gardens are situated at Peradeniya, 3 miles distant. It is a uniquely beautiful, highland, tropical town, full of interesting historical and Buddhistical associations. A water-supply and electric lighting are amongst recent introductions. Roman Catholic missions are extensive, and very active in the work of education, for which a large block of buildings has been erected. The Church of England, Wesleyan, and Baptist missions are also at work. The population of the town in 1900 was 26,117; of the district, 375,665. Average annual rainfall is 81½ inches; average temperature is 75.3°. There is a branch railway from Kandy, north to Matale, 17 miles.

Kano, a borough of McKean county, Pennsylvania, U.S.A., at the intersection of several railways. It lies in a region of natural gas, oil, and lumber, and contains railway repair shops. Population (1890), 2944; (1900), 5296, of whom 971 were foreign-born.

Kangávar, a small district of Persia, situated between Hamadán and Kermánshah, and, being held in fief by the family of a deceased court official, forming a separate government. The district is very fertile and contains 30 villages. Its revenues amount to about £500 per annum, and its chief place is the large village of Kangávar, which has a population of about 2500, and is 47 miles from Hamadán on the high-road to Kermánshah.

Kangra, a town and district of British India, in the Jullundur division of the Punjab. The town, sometimes called Nagarkot, is situated in 32° 5' N. and 76° 18' E., 2409 feet above the sea. Population (1881), 5387; (1891), 5234; municipal income (1897-98), Rs.5670. In 1855 the headquarters of the district were removed to the sanitarium of Dharmsala, where a zenana hospital was opened in 1897. The district of Kangra extends from the Jullundur Doab far into the southern ranges of the Himalaya. Besides some Rajput states, annexed after the Sikh wars, it includes Lahul, Spiti, and Kulu, which are essentially Tibetan. Area, 9574 square miles, of which Kangra proper has only 2725. Population (1881), 730,845; (1891), 763,030; average density, 80 persons per square mile, ranging from 224 in Kangra proper to only one person per square mile in Spiti. In 1901 the population was 768,382, showing an increase of less than 1 per cent. The land revenue and rates were Rs.9,17,049, the incidence of assessment being R.1 : 1 : 11 per acre; cultivated area (1896-97), 602,867 acres, of which 173,037 were irrigated from private canals; number of police, 427; number of schools (1896-97), 88, with 3619 pupils, the proportion of boys at school to the male population of school-going age being 5.9 per cent.; registered death-rate (1897), 28.6 per thousand. Tea cultivation was introduced into Kangra about 1850, and has been adopted by the natives. There are also several English planters. The total area under tea is about 10,000 acres, with a yearly out-turn of about 2,300,000 lb. There are a printing-press and a brewery at Dharmsala. There is no railway in the district, nor are there any metalled roads.

Kankakee, capital of Kankakee county, Illinois, U.S.A., on the Kankakee river, at an altitude of 627

feet. It is at the intersection of the Cleveland, Cincinnati, Chicago and St Louis, the Illinois Central, and the Indiana, Illinois, and Iowa railways. It has a level site on the prairie and a regular plan. It contains a state insane asylum. Population (1890), 9025; (1900), 13,595, of whom 3346 were foreign-born and 175 negroes.

Kano. See HAUSA.

Kansas, the central commonwealth of the American Union, bounded on the N. by Nebraska, on the E. by Missouri, on the S. by Oklahoma and Indian Territory, on the W. by Colorado. It is commonly known as the Sunflower State. The eastern third of the state is heavily timbered along the streams, and the forest area increased rather than diminished during the last quarter of the 19th century, in consequence of the settling of the country, which put a stop to prairie fires. The rainfall is ample, and general crop failures are unknown. The western third of the state is in the semi-arid region, with insufficient rain and without forests. The prevalent natural vegetation is buffalo grass, cactus, and yucca. Alfalfa, Kaffre corn, and other drought-resisting plants are grown, and cattle raising and fattening have become the most profitable industries. The central third of the state is intermediate in character between the eastern and western sections. The annual rainfall of the eastern section is 35 inches; of the central section, 25 inches; of the western section, 15 inches.

Population.—According to the census of 1880, the population was 995,966; in 1890 it was 1,427,096, and in 1900 it was 1,470,495. There was a steady increase from 1880 until 1888, when it reached 1,518,552. The opening of Oklahoma for settlement in 1889 withdrew at least 50,000 people, and this, combined with unsettled political conditions, produced a reduction to 1,334,734 in 1895. During each year since 1895 there was a gradual gain, until in 1899 the population reached 1,425,119, and in 1900 was 1,470,495. The net increase from 1880 to 1890 was 43·3 per cent., and from 1890 to 1900, 3 per cent. The population of the eleven largest towns in 1900 was as follows: Kansas City, 51,418; Topeka, 33,608; Wichita, 24,671; Leavenworth, 20,735; Atchison, 15,722; Lawrence, 10,862; Fort Scott, 10,322; Galena, 10,155; Pittsburg, 10,112; Hutchinson, 9379; Emporia, 8223. Of the population of Kansas in 1900, 768,716 (52·3 per cent.) were males and 701,779 were females; 1,343,810 were native-born and 126,685 (8·6 per cent.) were foreign-born. The total white population was 1,416,319; the total coloured population was 54,176, of whom 52,003 were negroes, 4 Japanese, 39 Chinese, and 2130 Indians.

Education.—The total amount expended for common school purposes in Kansas in 1899 exceeded \$4,000,000; the number of children of school age was 496,000; the number of pupils enrolled was 370,240; the average daily attendance was 257,000; the number of teachers required was 12,513; the average length of the school year was twenty-five weeks; the average salary of male teachers was \$39 per month, of female teachers, \$32; the total value of common school property was \$10,000,000. In 1900 Kansas stood near the head of the list of American states in the small percentage of illiteracy. Out of 413,786 adult males, 14,214, or 3·4 per cent., were illiterate (unable to write); the percentage of illiteracy among the native white adult males of native parents was only 1·7. Not a single soldier in the famous 20th Kansas regiment in the Spanish war was unable to write his own name. The state maintains, as a part of her free school system, a well-equipped state university at Lawrence, an Agricultural College at Manhattan, and a Normal School at Emporia. The university in 1900 had a faculty of 78 members, an attendance of 1150 students, 10 buildings, and an annual maintenance fund of \$130,000. The state Agricultural College and the state Normal School had also progressed satisfactorily. In addition to the state schools, flourishing colleges are supported by the various religious denominations.

Charities.—The following table shows the state charitable and correctional institutions, with the number of inmates, May 1900, and the appropriations for support for 1899 and 1900. In addition to this, 77 counties, with farms for poor, cared for 1595 indigent persons in 1899 at a net cost of \$105,440; out-door relief given in 100 counties amounted to \$344,555. The state voted support for 14 charitable institutions, chiefly hospitals, amounting to \$19,600 for 1899 and 1900, and reimbursed counties for the support of insane in previous years to the amount of \$221,950, besides providing for the expenses of the state Board of Charities

to the amount of \$17,000, and for other local boards to the amount of \$11,600 for the years named.

Name.	Locality.	Inmates.	Appropriation.	
			Current Expenses.	Improvements.
Penitentiary	Lansing	988 ¹	\$308,702	\$154,000
Industrial Reformatory	Hutchinson	220	115,630	77,500
Industrial School (girls)	Beloit	116	48,820	25,000
Reform School (boys)	Topeka	180	126,804	25,000
Insane Asylum	Topeka	850	257,620	33,500
Insane Asylum	Osawatomie	1080	308,198	50,000
Blind Asylum	Kansas City	85	49,578	None
Imbecile School	Winfield	204	88,940	40,000
Deaf and Dumb School	Olathe	250	92,180	4,000
Soldiers' Orphans' Home	Atchison	134	75,960	None

Agriculture.—The following table exhibits the quantities and values of farm crops and live-stock products for 1899:—

	1899 Quantities.	1899 Values.
Winter wheat	42,815,471 bushels	\$22,016,970
Spring wheat	871,542 "	389,441
Corn	225,183,432 "	53,530,576
Oats	26,046,773 "	4,951,636
Rye	1,754,406 "	690,408
Barley	3,352,845 "	781,202
Buckwheat	8,268 "	5,374
Irish potatoes	7,664,405 "	2,612,340
Sweet potatoes	334,080 "	150,269
Castor beans	37,862 "	34,076
Cotton	27,650 lb	1,383
Flax	1,412,941 bushels	1,271,647
Hemp	34,000 lb	1,700
Tobacco	12,250 "	1,225
Broom corn	14,000,705 "	455,023
Millet ²	796,323 tons	2,354,348
Sorghum	1,539,193 gallons	492,541
Sorghum forage	2,457,304
Milo maize	25,159 tons	66,093
Kaffre corn	2,095,429 "	5,073,598
Jerusalem corn	10,497 "	25,179
Forage ³	2,656,482 "	9,278,817
Animals ⁴	50,533,797
Poultry and eggs ⁵	4,241,869
Wool clip	712,181 lb	106,827
Cheese	1,163,680 "	104,731
Butter	43,757,767 "	5,890,273
Milk sold	648,054
Garden products ⁶	700,745
Horticultural ⁶	523,445
Wood ⁶	125,105
Wine	155,778 gallons	116,834
Honey and Beeswax	760,450 lb	114,307
Grand total		\$169,747,037

Mineral Products.—Since 1880 extensive mineral deposits have been discovered. A bed of rock-salt underlies nearly the whole of central and western Kansas at depths of from 300 to 1200 feet, varying in thickness from 250 feet in Ellsworth county to upwards of 400 feet in Harper, Kingman, and Reno counties. The salt mined in 1899 was valued, without cooerage, at \$760,200, and the total production since 1880 was valued at \$5,538,855. Natural gas, oil, zinc, and lead have been discovered in south-eastern Kansas. In 1899, 63,369 tons of zinc ore, worth \$2,321,775, yielded 31,684 tons of metallic zinc, valued at \$3,643,729; and 13,190 tons of lead ore, worth \$337,038, yielded metallic lead of the value of \$429,344. The coal produced was valued at \$5,124,248, and the total output 1880 to 1899 was valued at \$60,209,900. The total value of mineral products in 1899 was \$11,894,576, and the grand total value 1880 to 1899 was estimated at \$120,053,088.

Railways.—There are 29 railways in the state, with a total Kansas mileage of 8777 in 1899, as compared with 3104 in 1880. The most important of these railways and their respective mileage in Kansas are as follows: Atchison, Topeka, and Santa Fé, 2440 miles; Chicago, Rock Island, and Pacific, 1124 miles; Union Pacific, 480 miles; Chicago, Burlington, and Quincy, 259 miles; St Louis and San Francisco, 269 miles; Missouri Pacific, 1826 miles; Kansas City, Fort Scott, and Memphis, 258 miles; Missouri, Kansas, and Texas, 444 miles.

Finance.—The total assessed valuation of property for the fiscal year 1898-99 was \$325,889,744. The total state tax levy for the same year was 4 $\frac{1}{2}$ mills, but the amount of income from this

¹ 207 from Oklahoma, 3 Federal civil.

² Including Hungarian.

⁴ For slaughter.

³ Grass, alfalfa, and clover.

⁵ Sold.

⁶ Marketed.

levy was so much in excess of the amount required for the state expenses that the sum of \$80,000 was returned to the various counties. The constitution of Kansas forbids the contraction of a state debt in excess of \$1,000,000. The actual state debt, 30th June 1900, was \$692,000.

Banks.—According to the report of the state bank commissioner of 1898, there were in Kansas 101 national banks, with capital stock paid in of \$8,442,100, with individual deposits of \$21,243,147, and with average reserve held of 33·69 per cent. There were also 370 state and private banks, with an average invested capital of \$7,436,097, with individual deposits of \$22,500,000, and a reserve of nearly 50 per cent.

Religious Sects.—The statistics of religious denominations in Kansas in 1890 were as follows: Number of congregations, 4927; number of churches, 2859; seating capacity, 708,134; value of church property, \$7,452,269; communicants, 236,729; percentage of communicants to population, 23·58. The following is a tabular exhibit of the different denominations and their statistics:—

	Congregations.	Churches.	Seating Capacity.	Value of Church Property.	Communicants.
Adventists	107	25	5,090	\$13,550	3,205
Baptists	617	364	95,715	921,958	84,665
Catholics	867	271	55,730	625,561	67,562
"Christians"	49	8	1,665	8,250	1,676
Congregationalists	153	162	34,975	485,975	11,945
Disciples of Christ	352	197	55,045	468,975	25,200
Dunkards	91	40	15,135	61,625	4,067
Evangelical Association	96	50	10,060	35,000	4,457
Friends (3 bodies)	70	56	16,334	84,815	8,237
German Evangelical Synod	23	19	3,794	37,750	2,053
Lutherans	205	147	33,638	413,410	16,232
Latter-Day Saints	25	4	800	3,300	1,072
Mennonites	62	81	9,203	45,130	4,620
Methodists	1529	894	219,589	2,326,265	95,731

Manufactures.—The following table shows the condition of manufacturing in Kansas in 1890 and 1900:—

	1890.	1900.	Per cent. of Increase.
Number of establishments	4,471	7,830	75·1
Capital	\$43,926,002	\$66,827,362	52·1
Average number of wage-earners	28,237	35,193	24·6
Total wages	\$13,288,175	\$16,317,689	22·8
Salaried officials, clerks, &c.—			
Number	4,606 ¹	3,860	16·2 ²
Salaries	\$3,040,310 ¹	\$3,256,086	7·1
Miscellaneous expenses	\$5,853,466	\$5,241,450	10·5 ²
Cost of materials used	\$78,845,167	\$129,485,320	64·2
Value of products, including custom work and repairing	\$110,219,805	\$172,129,398	56·2

The most important manufacturing industry in 1900 was slaughtering and meat-packing, with 14 factories, a capital of \$16,486,177, an average number of 8117 wage-earners, and products valued at \$77,411,883. The flouring and grist-mill industry ranked next, with 533 factories, an average number of 1451 wage-earners, and products valued at \$21,926,768.

Politics.—Until 1890 Kansas had always been strongly Republican, giving in 1888 a majority of 80,000 for Benjamin Harrison in the Presidential election. But widespread depression on account of short crops and excessive mortgage indebtedness gave rise to the People's Party, commonly known as the Populist Party, and in 1890 the Republican state ticket was elected by only a small plurality. In general, the People's Party alone has not been able to carry the state; but in 1896, by means of a fusion, it elected the state officials and both branches of the legislature, and Bryan Presidential electors. In 1898, with the return of prosperity, the payment of \$100,000,000 of mortgage indebtedness, and the decline of the silver issue, the Republicans elected the state ticket.

Liquor Traffic.—The people of Kansas, in November 1880, adopted an amendment to the state constitution forever prohibiting the manufacture and sale of intoxicating liquors except

¹ Includes proprietors and firm members, with their salaries.

² Decrease.

for medical, scientific, and mechanical purposes. At every subsequent session of the legislature the enemies of the prohibitory law attempted to overthrow it, but without avail. The degree of its enforcement has varied from zero to perfection, according to the locality. Being an agricultural state, with no city of more than 50,000 inhabitants, and only eight cities exceeding 10,000, Kansas is favourably conditioned for the enforcement of such a law. According to the *Brewers' Journal*, the official organ of the United States Brewers' Association (January 1900), Kansas consumes annually an average of 5257 barrels of beer, or only 1·30th as much as Nebraska, 1·40th as much as Colorado, and 1·450th as much as Missouri. (F. H. S.)

Kansas City, capital of Wyandotte county, Kansas, U.S.A., in 39°07' N. and 94°37' W., on the west bank of the Missouri, at the mouth of the Kansas, at an altitude of 760 feet. It is separated from Kansas City, Missouri, only by the state line. It is the largest city in the state, and is built mainly upon the low, level bottom-land, at the junction of the two rivers, in part spread up on the surrounding heights. Its plan is regular; it is divided into six wards, and its business streets are paved mainly with wood. It contains numerous stockyards, and its chief business is slaughtering and meat-packing. With the exception of Chicago, it is the largest live-stock market in the world. The census of 1900 showed 492 manufacturing establishments, with \$18,633,475 capital, 10,544 hands, and a product valued at \$82,768,943. Of this \$73,205,027 consisted of the product of its slaughtering and meat-packing houses. The city is upon the Union Pacific, the Missouri Pacific, and the Kansas City and North-Western railways. Kansas City University was founded in 1896. In 1899 this had 78 instructors and 213 students, of whom 49 were women. The assessed valuation of real and personal property in 1900, on a basis respectively of about one-third and one-fifth of the full value, was \$10,956,263; net debt, \$2,392,216; rate of taxation, \$50 per \$1000. Kansas City was founded in 1886, by the consolidation of Kansas City, Armourdale, Armstrong, and Wyandotte. Population (1890), 38,316; (1900), 51,418, 6377 being foreign-born and 6509 negroes.

Kansas City, in Jackson county, Missouri, U.S.A., the second city in size and importance in the state, is situated on the right bank of the Missouri, immediately below the mouth of the Kansas river, in 39° 5' N. and 94° 38' W. It lies on the boundary line between Missouri and Kansas, and adjoins Kansas City, Kansas. The two form a single commercial community with undivided interests. Kansas City, Missouri, in 1890 had 132,416 inhabitants, and in 1900, 163,752, 18,410 being foreign-born and 17,567 negroes. Out of 53,708 adult males, 2096 were illiterate (unable to write), of whom 1176 were negroes. The two cities cover an area of 40 square miles. Though the cities have separate municipal organizations, the boundary is so little heeded that in many cases houses and factories have been built upon it. Kansas City, Missouri, is built upon an irregular surface with a variation of almost 300 feet in altitude from the heights to the stretches which lie along the rivers, and which are occupied by railroad tracks, wholesale houses, and live-stock yards. As a result of the trend of trade, which makes the commercial territory of most American cities lie to the west of them, it is allied more with Kansas than with Missouri. Its live-stock market is the second largest in the world, receipts in 1901 having amounted to 6,640,000 head of cattle, hogs, and sheep, of which 5,350,000 were slaughtered in the great packing-houses of the city, and the product distributed throughout the world. It is the largest primary winter wheat market in the United States. Its grain receipts in 1901 were 40 million bushels. It has flour-mills with capacity for 2 million barrels a year. Its sales of agricultural machinery exceed

those of any other city in the world, and it has a large wholesale trade in groceries, hardware, drugs, dry goods, shoes, shirts, and garments, extending to the Gulf of Mexico and to the Pacific coast. Twenty-two railways, of sixteen separate systems, have termini in Kansas City. The Convention Hall can accommodate 20,000 persons. The city has ten miles of boulevards, and the park system includes 450 acres in the city and 1350 acres lying four miles beyond the city limits. The cost of buildings erected in 1901 was 7 million dollars. The street car systems embrace 140 miles of track, and are worked by electricity and by cable. The deposits in the banks amount to 75 million dollars. The bank clearances in 1901 were 920 million dollars. The annual cost of city government is above 1 million dollars, and the municipal debt (1901) was \$3,600,000, including \$3,100,000 invested in the waterworks, which the city owns, and which yield a net revenue more than sufficient to pay the interest. (W. R. N.)

Kansk, a district town of Russia, eastern Siberia, government of Yeniseisk, 142 miles by rail east of Krasnoyarsk, on the Kan river and the Siberian highway. Although it is the chief town of a district in which gold is found (in the tributaries of the Kan), the town is slow to develop, as it lies on low ground inundated by the river. Population (1897), 7504.

Kaposvár, a corporate town in the south-western part of Hungary, capital of the county of Somogy. It is a pleasant little town, with a large hospital, county hall, state gymnasium, two secondary schools (burgher schools) for girls, an institute for children of railway employees, a founding hospital, three military barracks, and school for deaf and dumb children. Among the factories are a sugar refinery, a cement-plate works, and two steam mills. Its industry and commerce, as well as its stock-rearing, are considerable. Population (1890), 12,544; (1900), 18,218.

Kapunda, a town of South Australia, in the county of Light, 48 miles by rail north-north-east of Adelaide. The celebrated copper mines were closed in 1879. The district is a wheat-growing one, and has quarries of fine marble.

Kapurthala, a native state of India, within the Punjab. Area, 598 square miles; population (1881), 252,617; (1891), 299,690, showing an increase of 19 per cent.; average density, 501 persons per square mile. In 1901 the population was 314,269, showing a further increase of 5 per cent. The estimated gross revenue was Rs.20,00,000; tribute, Rs.1,31,000; military force (including police) 1773 men. The raja, Sir Jagatjit Sing, K.C.S.I., has more than once visited Europe, and was present at the celebration of Queen Victoria's Diamond Jubilee in London. During the Tirah expedition of 1897-98 the raja's Imperial Service infantry took a prominent part. The territory is crossed by the railway from Jullundur to Amritsar. In 1896-97 the total number of schools was 160, with 3985 pupils, including 214 girls; the proportion of boys at school was as high as 1 out of every 41 of the total male population. There is one arts college, with 6 students; and four Anglo-vernacular schools, with 944 pupils, of whom 9 passed the matriculation. The town of KAPURTHALA is situated in 31° 23' N. and 75° 25' E., 11 miles from Jullundur. Population, about 15,000.

Karachev, a district town of Russia, government and 55 miles by rail west-north-west of Orel. It is one of the oldest towns of Russia, having been mentioned in the annals since 1146, and has hemp factories and oil works, besides trade in grain, hemp, hempseed, hides, and horses. Population, 15,605.

Karachi, or KURRACHEE, a seaport city and district of British India, in the Sind province of Bombay. The city is at the extreme western end of the Indus delta, 500 miles by sea from Bombay and 820 miles by rail from Lahore, being the maritime terminus of the North-Western railway. Population (1881), 73,560; (1891), 105,199, showing an increase of 44 per cent.; (1901), 115,407, showing a further increase of 10 per cent. Karachi practically dates from its occupation by the British in 1839, when it was at once chosen for the seat of government for Sind instead of Haidarabad. The natural harbour formed by Manora Point has been greatly improved by the construction of the Napier mole from Kiamari island to the mainland, and of a breakwater seawards. It can now admit vessels of the largest tonnage, and has excellent railway accommodation. It has been growing yearly in importance as the maritime outlet for the produce of the entire valley of the Indus. It ranks as the fifth port in India, with nearly 7 per cent. of the total commerce. In 1897-98 the aggregate value of its seaborne trade amounted to Rs.14,91,31,890, of which Rs.9,63,21,602 represented foreign trade and Rs.5,28,10,288 coasting trade. The foreign imports were valued at Rs.5,01,10,718, of which Rs.2,95,97,101 represented imports from the United Kingdom, the other countries next in order being Germany, Austria, Belgium, Mauritius, Persia, Turkey, the Mekran coast and France. The number of steamers that entered with cargoes was 111, of 168,154 tons; the number that cleared was 130, of 225,553 tons. The gross amount of import duty collected was Rs.27,05,844. During the ten years from 1888-89 to 1897-98, the total value of private merchandise imported rose from Rs.3,56,29,570 to Rs.4,63,28,110; and the total value of private merchandise exported rose from Rs.3,81,42,550 to Rs.4,59,56,210. During the same period the total number of steam and sailing vessels that entered and cleared with cargoes fell from 764 to 727; but the tonnage rose from 413,576 to 431,236. The large industries include seven cotton presses, employing about 300 hands; three ironworks, employing 400 hands; and six flour-mills. There are also manufactures of cotton-cloth, silk scarves, and carpets. Manora Head contains the lighthouse and the port establishment. The military cantonments, stretching north-east of the city, contain accommodation for a battery and a European regiment. An excellent water-supply is provided by an underground aqueduct 18 miles in length. The chief educational institutions are the Dayaram Jethmal College, with a law class; five high schools, of which two are for Europeans; a convent school for girls, with a training class for mistresses; and an engineering class. In 1896-97 almost all of these were closed because of the plague, which ravaged the city intermittently for four years. In 1897 the registered death-rate was 70 per 1000; and down to July 1898 the total number of deaths from plague was 5800. The expenditure incurred has reduced the municipality almost to a state of bankruptcy. There are thirteen printing-presses, issuing several newspapers in English and the vernaculars. The district of KARACHI has an area of 14,182 square miles; population (1881), 489,496; (1891), 560,880, showing an increase of 15 per cent.; average density, 40 persons per square mile. In 1901 the population was 607,439, showing an increase of 6 per cent. The land revenue and rates were Rs.15,34,763, the incidence of assessment being R.1 per acre; cultivated area (1897-98), 591,135 acres, of which 439,253 were irrigated, including 191,342 from Government canals; number of police, 1285; children at school (1897-98), 14,677, being 2.9 per cent. of the total population; registered death-rate (1897), 22 per 1000, showing that the plague was then almost confined

to the city, though in 1898 it broke out rather severely in the district from April to June. The principal crops are rice, millet, oil-seeds, and wheat. In addition to Karachi, there are seaports at Sirgonda and Ketī Bandar, which conduct a considerable coasting trade. Tatta was the old capital of Sind. Kotri is an important railway station on the Indus. The main line of the North-Western railway runs through the district for 230 miles, with 15 stations. From Kotri downwards the line has been doubled to Karachi, and at Kotri a bridge has been constructed across the Indus opposite Haidarabad, to connect with the Rajputana railway system. (J. S. Co.)

Kara-Hissar.—1. ΑΦΙΨΝ ΚΑΡΑ-ΗΙΣΣΑΡ (*q.v.*). 2. ΙΧΗΕ, or ISCHA KARA HISSAR, the ancient *Docimium*, a small village about fourteen miles north-east of No. 1. Docimium was a Macedonian colony established on an older site. It was a self-governing municipality, striking its own coins, and stood on the Apamea-Synnada-Pessinus road, by which the celebrated marble called Synnadic, Docimian, and Phrygian was conveyed to the coast. The quarries are two and a half miles from the village, and the marble was carried thence direct to Synnada (Chifūt Kassaba). Some of the marble has the rich purple veins in which poets saw the blood of Atys. (RAMSAY, *Hist. Geog. of Asia Minor*; MURRAY, *Hbk. to Asia Minor*.) 3. KARA-HISSAR SHARKI, *i.e.*, western Kara-Hissar, also called Shabin Kara-Hissar from the "alum" mines in its vicinity, the chief town of a sanjak of the same name in the Sivas vilâyet of Asia Minor. The town (the ancient *Colonia*, Armenian *Nikopoli*), altitude 4860 feet, is built round the foot of a lofty rock, upon which stand the ruins of the Byzantine castle, Maurocastron. It is connected with its port, Kerasund, and with Sivas, Erzingan, and Erzerûm, by carriage roads. Its population is 12,000 (Moslems 7500, Christians 4500). In October 1895 there was a massacre of Armenians. *Colonia* was a fortress of importance during the frontier wars of the later Byzantine Empire.

Karakoram. See PAMIRS.

Karakorum (Turkish, *black stone debris*), the name of two cities in Mongolia. One of these, according to Potanin, was the capital of the Uigur kingdom in the 8th century, and the other was in the 13th century a capital of the steppe monarchy of Mongolia. The same name seems also to have been applied to the Khangai range at the headwaters of the Orkhon. (1) The Uigur KARAKORUM, also named Mubalik (*bad town*), was situated on the left bank of the Orkhon, in the Talal-khain-dala steppe, to the south-east of Ughai-nor. It was deserted after the fall of the Uigur kingdom, and in the 10th century Abaki, the founder of the Kidan kingdom, planted on its ruins a stone bearing a description of his victories. (2) The Mongolian KARAKORUM was founded at the birth of the Mongolian monarchy established by Chinghiz Khan. A palace for the khan was built in it by Chinese architects in 1234, and its walls were erected in 1235. Plano Carpini visited it in 1246, Ruysbruk in 1253, and Marco Polo in 1275. Later, the fourth Mongolian king, Khubilai, left Karakorum, in order to reside at Kai-pin-fu, near Peking. When the khan Arik-bog declared himself and Karakorum independent of Khubilai-khan, the latter besieged Karakorum, took it by famine, and probably laid it waste so thoroughly that the town was afterwards forgotten. The exact sites of the two Mongolian capitals were only established in 1889-91. Yule (*The Book of Marco Polo*, 1871) was the first to distinguish two cities of this name. The Russian traveller Paderin in 1871 visited the Uigur capital, named now by the Mongols Khara-kherem (*black wall*), of which only the wall and a tower are in existence,

while the streets and ruins outside the wall are seen at a distance of 1½ miles. As to the site of the Mongolian Karakorum, the natives describe it as the ruins of Ketakhoto. The proper position of the two Karakorums was determined by the expedition of Yadrintseff in 1889, and the two expeditions of the Helsingfors Ugro-Finnish Society (1890) and the Russian Academy of Science, under Dr Radloff (1891), which were sent out to study Yadrintseff's discovery. See *Works (Trudy) of the Orkhon Expedition*. St Petersburg, 1892. (P. A. K.)

Kara-kul, Great and Small, two lakes of Russian Turkestan, Osh district of Fergana, on the Pamir plateau. Great Kara-kul, 14 miles long and about 13 miles wide (formerly much larger), is under 39° N., to the south of the trans-Alai range, at an altitude of 13,200 feet; it is surrounded by high mountains, and is reached from the north through the Kizil-art pass (14,560 feet). Small Kara-kul lies in the north-east Pamir, or Sarykol, to the north-west of the Mustagh-ata peak (25,800 feet), at an altitude of 12,700 feet. A stream of the same name flows through it, and is named Ghöz in its farther course. KARA-KUL is also the name of an oasis on the Trans-caspian railway, formerly flourishing but now nearly buried in sand.

Kara-kum (Black Sands), two plains, partly prairie-like and partly sandy, in Russian Central Asia. One of them occupies a surface of nearly 110,000 square miles, bounded on the N.W. by the Ust-urt plateau, on the E. by the Amudaria, on the S. by the Turcoman oases, and on the W. nearly reaching the Caspian Sea. Only part of this surface is covered with real sand. There are also wide spaces (*takyrs*), nearly horizontal, covered with clay, upon which water accumulates in the spring; in the summer they are muddy first, but later quite dry, and merely a few Solanæ and bushes grow on their surface. There are also *shors*, similar to the above, but covered with salt and gypsum, and adorned only with Solanæ along their borders. The remainder is occupied with sand, which, according to V. Mainoff, takes five different forms: (1) The *barkhans*, chiefly in the east, which are mounds of loose sand, from 15 to 35 feet high, hoof-shaped, having their gently-sloping convex side turned towards the prevailing winds, and a concave side, 30° to 40° steep, on the opposite slope. They are disposed in groups or chains, and the winds make them slowly progress towards the south and south-east. Some grass (*Stipa pennata*) and bushes of *saksaul* (*Haloxylon ammodendron*), and other steppe bushes (*Calligonum*, *Halimodendron*, *Atraphaxis*, &c.), cover them. (2) Mounds of sand, of about the same size, but irregular and of a slightly stronger consistence, mostly covered with the same bushes, and also with *Artemisia* and *Tamarix*; they are chiefly met with in the east and south portion of the Kara-kums. (3) A sandy desert, slightly undulating, and covered in the spring with grass and flowers (tulips, *Rheum*, various umbellifers, &c.), which are soon burned by the sun; they cover very large spaces in the south-east. (4) Sands disposed in large waves from 50 to 70, and occasionally up to 100, feet high, at a distance of from 200 to 400 feet from each other; they cover the central portion, and their vegetation is about the same as in the preceding division. (5) The dunes on the shores of the Caspian, composed of moving sands, from 35 to 80 feet high and devoid of vegetation.

A typical feature of the Kara-kums is the number of "old beds," which may have been either beds of branches of the Amu and other rivers, or depressions which contained elongated salt lakes. (See TRANSCASPIAN PROVINCE.) Water is only found in wells, from 13 to 20 miles apart—sometimes as much as 100 and 110 miles—which are pierced in the *takyrs* and give salted water, occasionally unfit to drink, and in *kaks* or pools of rain-water retained in the lower parts of the *takyrs*. The population of

the Kara-kums, consisting of nomadic Kirghiz and Turcomans, is very small. The region in the north of the Syr-daria, towards Lake Chalkar denghiz, is also called Kara-kum. (P. A. K.)

Karasu-bazar, a town of Russia, Crimea, government of Taurida, district and 28 miles east-north-east of Simpheropol. Population (1897), 12,961, consisting of Tatars, Armenians, Greeks, Karaims, Jews, and about 200 so-called Krymchaki, *i.e.*, Jews who have adopted the Tatar language and dress, who live chiefly by embroidering morocco leather goods and by other small handwork. It is a considerable centre for the export of fruit from various parts of Crimea.

Karatau, a chain of mountains in Russian Turk-estan, running from the south-west extremity of the Talas Alatau (Tian Shan) in a north-west direction, for 250 miles, between the Syr-daria and the Chu, ending in 44° 15' N. Its average altitude is about 5000 feet, and some of its summits, especially in its middle and south-east portion, reach 7000 feet. It is built up of Metamorphic slates and Devonian, Carboniferous, and Jurassic deposits, with occasional intrusions of granites and melaphyres. Its south-west slope is gentler than the opposite slope. The ridge is but poorly clothed with forests in its south-east parts, and the rivers which rise in it are short and soon lost in the sands. At its base it has a girdle of loess. Coal, lead, and iron are found.

Karateghin, a bekdóm occupying a hilly part of Bokhara, on the middle course of the Vaksh or Surkháb. It has on the N. the Russian Turkestan provinces Samarkand and Fergána, from which it is separated by the Hissar and Alai ridges; Fergana on the E.; Darvaz on the S. (ridge of Peter the Great); and Hissar on the W. Its area covers about 4200 square miles, and its population numbers some 60,000. Surrounded by high mountain ridges of difficult access, it is also nearly all covered with mountains, its best part being the high valley of Surkháb (4500 to 6500 feet of altitude). The population consists chiefly of Tajiks and some 10,000 Kara-kirghiz in the east. The former carry on agriculture and gardening, and the latter cattle-breeding. Some rough stuffs, carpet-bags, and woollen goods are made in the villages. Sheepskins, furs, carpet-bags, and so on are exported. The chief town is Garm, on the Vaksh.

Karauli, or KEROWLEE, a native state of India, in the Rajputana Agency. Area 1229 square miles; population (1881), 148,670; (1891) 156,587, showing an increase of 5 per cent.; average density, 127 persons per square mile. In 1901 the population was 156,786. The revenue (1896-97) was Rs.4,67,000; no tribute. The maharaja, Bhanwar Pal Deo, was born in 1862 and succeeded in 1866. He was appointed G.C.I.E. in 1897, on the occasion of Queen Victoria's Diamond Jubilee. In 1897-98 coins to the value of Rs.25,060 were struck at the mint. On the reverse they bear the title "Kaisar-i-Hind" in Persian characters. The town of KARAU LI has a population (1881) of 25,607; (1891), 23,124. Its schools had 198 pupils in 1897-98, of whom 39 were learning English.

Karen-ni, the country of the Red Karens, a collection of small states, formerly independent, but now feudatories of Burma. It is situated approximately between 18° 50' and 19° 55' N. and between 97° 10' and 97° 50' E. The tract is bounded on the N. by the Shan States of Mông Pai, Hsatung, and Mawkmái; on the E. by Siam; on the S. by the Papun district of Lower Burma; and on the W. a stretch of mountainous country, inhabited by the Brè and various other small tribes, formerly in a state of independence, divides it from the districts of Tungu and Yamèthin. It is divided in

a general way into eastern and western Karen-ni; the former consisting of one state, Gantarawadi, with an approximate area of 2500 square miles; the latter of the four small states of Kyèbogyi, with an area of about 350 square miles; Bawlákè, with an area of 200 square miles; Nammèkôn, with 50 square miles; and Naungpalè, with about 30 square miles. The small states of western Karen-ni were formerly all subject to Bawlákè, but the subordination had for long been becoming less and less defined, and has now ceased. There was also a small state in the hills west of the Pawn stream, called Saoh-payun, containing six villages, with a chief in charge of them. The state of Ngwedaung, called Loi Ngün by the Shans, is now also subordinate to Gantarawadi. Karen-ni consists of two widely differing tracts of country, which roughly mark now, and formerly actually did mark, the division into east and west. Gantarawadi has, however, encroached westwards beyond the boundaries which nature would assign to it. The first of these two divisions is the southern portion of the valley of the Hpilu, or Balu stream, an open, fairly level plain, well watered and in some parts swampy. The eastern half consists of the Loikaw and Ngwedaung circles of Gantarawadi, and the western of the Nammèkôn and Naungpalè states. South of this valley and between the Nam Pawn and its principal tributary, the Tu, lies a stretch of downs, having no overground drainage, undulating and exceedingly dry, though in parts fertile. On its eastern side are two or three small lakes, tinged by the soil to a permanent brick red. On the western side, in Kyèbogyi state, are a few small streams, which in April and May almost entirely dry up and only just suffice for the wants of the villages. The second division is a series of chains of hills, intersected by deep valleys, through which run the two main rivers, the Salween and the Pawn, and their feeder streams. Many of the latter are dried up in the hot season and only flow freely during the rains. Here there are small, level, watered valleys, as at Mèsè, Man Maü (Y wathit), Hsataw, and Sawlôn, but for the most part the country is precipitous and the soil arid. The whole country being hilly, the most conspicuous ridge is that lying between the Pawn and the Salween, which has an average altitude of 5000 feet. It is crossed by several tracks, passable for pack-animals, the most in use being the road between Sawlôn, the capital of Gantarawadi and Man Maü. The principal peak east of the Salween is on the Loi Lan ridge, 7109 feet above mean sea-level. Parts of this ridge form the boundary between eastern Karen-ni and Mawkmái on the west and Siam on the east. It falls away rapidly to the south, and at Pang Salang is crossed at a height of 2200 feet by the road from Hsataw to Mèhawnghsawn. West of the Balu valley the continuation of the eastern rim of the Myelat plateau rises in Loi Nangpa to about 5000 feet. The Nam Pawn is a large river, with an average breadth of 100 yards, but is unnavigable owing to its rocky bed. Even timber cannot be floated down it without the assistance of elephants. The Salween throughout Karen-ni is navigated by large native craft. Its tributary, the Mè Pai, on the eastern bank, is navigable as far as Mèhawnghsawn in Siamese territory. The Balu stream flows out of the Inle lake, and is navigable from that point to close on Lawpita, where it sinks into the ground in a marsh or succession of funnel holes. Its breadth averages 50 yards and its depth is 15 feet in some places.

Little of the history of the Red Karens is known, but it appears to be generally admitted that Bawlákè was originally the chief state of the whole country, east and west, but eastern Karen-ni under Papaw-gyi early became the most powerful. Slaving raids far into the Shan States brought on invasions from Burma, which, however, were

not too successful. Eastern Karen-ni was never reduced until Sawlapaw, having defied the British Government, was overcome and deposed by General Collett in the beginning of 1889. Sawlawi was then appointed Myoza, and received a *sanad* or patent of appointment on the same terms as the chiefs of the Shan States. The independence of the western Karen-ni states had been guaranteed by the British Government in a treaty with King Mindôn in 1875. They were, however, formally recognized as feudatories in 1892 and were presented with *sanads* on the 23rd January of that year. Gantarawadi pays a regular tribute of Rs.5000 yearly, whereas these chieftains pay an annual *kadaw* or *nuzzur* of Rs.100. They are forbidden to carry out a sentence of death passed on a criminal, without the sanction of the superintendent of the southern Shan States, but otherwise retain nearly all their customary law.

Tin, or what is called tin, is worked in Bawlâkè. It appears, however, to be very impure. It is worked intermittently by white Karens on the upper waters of the Hkëmappu stream. Rubies, spinels, and other stones are found in the upper Tu valley and in the west of Nammèkôn state, but they are of inferior quality. The trade in teak is the chief or only source of wealth in Karen-ni. The largest and most important forests are those on the left bank of the Salween. Others lie on both banks of the Nam Pawn, and in western Karen-ni on the Nam Tu. The yearly out-turn is estimated at over 20,000 logs, and forest officers have estimated that an annual out-turn of 9000 logs might be kept up without injury to the forests. Some quantity of cutch is exported, as also stick-lac, which the Red Karens graft so as to foster the production. Other valuable forest produce exists, but is not exported. Rice, areca-palms and betel-vine leaf are the chief agricultural products. The Red Karen women weave their own and their husbands' clothing. A characteristic manufacture is the *Pa-si* or Karen metal drum, which is made at Ngwedaung. These drums are from two and a half to three feet across the boss, with sides of about the same depth. The sound is out of proportion to the metal used, and is inferior to that of the Shan and Burmese gongs. It is thought that the population of Karen-ni is steadily decreasing. The estimated totals in 1897 were Gantarawadi, 23,000; Kyèbogyi, 4400; Bawlâkè, 4500; Nammèkôn, 3500; Naungpalè, 1750. The birth-rate of the people is considered to exceed the death-rate by very little, and the Red Karen habit of life is most unwholesome. They are short and small-made, but have great powers of endurance. Numbers have enlisted in the Burma police, but there are various opinions as to their value.

Karlsburg. See GYULA FEHÉRVÁR.

Karnál, a town and district of British India, in the Delhi division of the Punjab. The town is 7 miles from the right bank of the Jumna; railway station, 76 miles north of Delhi. Population (1881), 23,133; (1891), 21,963; municipal income (1897-98), Rs.31,234; death-rate (1897), 37 per 1000. There are manufactures of cotton cloth, blankets, and boots, besides considerable local trade and an annual horse fair. There is a municipal high school, with boarding-house, a printing-press, and four literary institutions. The district of KARNÁL stretches along the right or west bank of the Jumna, north of Delhi. It includes the historic sites of Panipat and Thanesar. Area, 2440 square miles; population (1881), 645,219; (1891), 683,718, showing an increase of 6 per cent.; average density, 280 persons per square mile. In 1901 the population was 883,457, showing an increase of 29 per cent., probably due to the extension of canal irrigation. The land revenue and rates (1897-98) were Rs.9,57,734, the incidence of assessment being 8 annas per acre; cultivated area, 449,621 acres, of which 289,356 were irrigated, including 169,083 from Government canals; number of police, 555; number of schools (1896-97), 155, attended by 4185 boys, being 6.7 per cent. of boys of school-going age; death-rate (1897), 40.8 per 1000. The principal crops are millet, wheat, pulse, rice, cotton, and sugar-cane. There are two factories for ginning and pressing cotton. The district is traversed for 74 miles

by the Delhi-Umballa-Kalka railway, and also by the Western Jumna canal. It suffered from the famine of 1896-97, when the maximum number of persons on relief was 12,361 in March 1897; and again to some extent in 1899-1900.

Karnul, or KURNOOL, a town and district of British India, in the Madras Presidency. The town is at the confluence of the Hindri river with the Tungabhadra. Population (1881), 20,329; (1891), 24,376; municipal income (1897-98), Rs.68,110. The water-supply was provided at a cost of Rs.1,50,000. The municipal high school had 137 pupils in 1897. The district of KARNUL has an area of 7514 square miles; population (1881), 678,551; (1891), 817,811, showing an increase of 21 per cent. after the famine of 1876-77; average density, 109 persons per square mile, being the lowest in the province. In 1901 the population was 872,423, showing a further increase of 6 per cent. The land revenue and rates (1897-98) were Rs.19,54,404, the incidence of assessment being R.1 per acre; cultivated area, 1,835,560 acres, of which 89,313 were irrigated, including 23,307 from Government canals; number of police 1071; boys at school (1896-97), 11,775, being 19 per cent. of the male population of school-going age; registered death-rate (1897), 28.8 per 1000. The principal crops are millet, cotton, oil-seeds, and rice, with a little indigo and tobacco. Karnul suffered very severely from the famine of 1876-77, and to a slight extent in 1896-97. It is traversed by the branch of the Southern Mahratta railway from Guntakal to Cumbum. It is also the chief scene of the operations of the Madras Irrigation Company, taken over by Government in 1882. The canal, which starts from the Tungabhadra river near Karnul town, was constructed at a total cost of Rs.2,16,38,942. In 1897-98 the irrigated area was 46,402 acres; and the receipts were Rs.1,56,220, compared with an expenditure (including interest) of Rs.9,92,570. A more successful work is the Cumbum tank, formed under native rule by damming a gorge of the Gundlakamma river. In 1897-98 the irrigated area was 8192 acres; and the return on capital outlay was 9 per cent. Apart from the weaving of coarse cotton cloth, the chief industries are 3 cotton presses, 167 indigo vats, and 21 saltpetre refineries.

Karolinenthal (Czech, *Karlin*), the chief town of a government district in Bohemia, Austria, and a manufacturing suburb of Prague, in which it is now practically merged. Population (1890), 19,540; (1900), 21,094, chiefly Czech.

Karolyi Aloys, COUNT (1825-1899), Austrian diplomatist, was born 8th August 1825. He sprang from a noble Magyar family which can trace its genealogy to the time of the foundation of the monarchy. After holding various inferior diplomatic appointments, he was in 1860 appointed envoy at Berlin. This post he held till the outbreak of war in 1866, and it was his duty to conduct the lengthy and complicated negotiations regarding Schleswig-Holstein, first during the co-operation of the two Great Powers, and afterwards when the final rupture was approaching. The story is well known how at the beginning of 1865 he was instructed categorically to ask Bismarck whether Prussia proposed to violate the treaty of Gastein. "No," answered Bismarck, but continued, "If we did intend to do so, I should give the same answer." It was a tribute to the ability he had shown in a very difficult position that he was chosen to negotiate with Bismarck the treaty of Nikolsburg, and when after 1870 thoroughly friendly relations were re-established

between the two German powers, he returned with the rank of ambassador to his old post. He was one of the Austrian representatives at the Congress of Berlin in 1878. In the next year he was transferred to London, where he remained till the year 1888, when he retired, owing to ill-health. It was to him that in 1880 Mr Gladstone addressed an apology for the unfriendly expressions regarding Austria-Hungary which he had used in his Midlothian campaign of that year. Karolyi died suddenly, while out shooting in Hungary, on 20th December 1889.

Karpathians. See CARPATHIAN.

Karr, Jean Baptiste Alphonse (1808-1890), French novelist, was born in Paris, 24th November 1808, and after being educated at the Collège Bourbon, became a teacher there. In 1832 he published a novel, *Sous les tilleuls*, characterized by an attractive originality and a delightful freshness of personal sentiment. A second novel, *Une heure trop tard*, followed next year, and was succeeded regularly by many others, which speedily made Karr a public favourite. His *Vendredi Soir* (1835) and *Le chemin le plus court* (1836) continued the vein of autobiographical romance with which he had made his first success. *Généviève* (1838) is one of his best stories, and his *Voyage autour de mon jardin* (1845), was deservedly popular. Others were *Feu Bressier* (1848), and *Forté en thème* (1853), which had some influence in stimulating educational reform. In 1839 Alphonse Karr, who was essentially a brilliant journalist, became editor of *Le Figaro*, to which he had been a constant contributor; and he also started a monthly journal, *Les Guêpes*, of a keenly satirical tone, a publication which brought him the reputation of a somewhat bitter wit. In 1848 he founded *Le Journal*. In 1855 he went to live at Nice, where he indulged his predilections for floriculture, and gave his name to more than one new variety. He was also devoted to fishing, and in *Les Soirées de Sainte-Adresse* (1853) and *Au bord de la mer* (1860) he made use of his experiences. His reminiscences, *Livre de bord*, were published in 1879-80. He died at Nice, 30th September 1890.

Karsandas Mulji (1832-1875), native journalist and social reformer of western India, was born on 25th of July 1832, of parents belonging to the Bania caste. Having lost his mother in infancy, he was left to the care of his stepmother, whose relations with Karsandas were not very affectionate. He received an ordinary Gujrathi education and then joined the Elphinstone Institution to study English. He competed for a prize offered for an essay on the re-marriage of Hindu widows, but his parents were so shocked at the lad's earnest advocacy of this reform that they turned him out of the house. He had to stop his collegiate education, and starvation stared him in the face. At last he succeeded in getting a teachership at the Gokuldas Tejpal seminary, thus attaining a position in which he could freely express his views on social reform. To promote this end he also co-operated with some benevolent men of Bombay, prominent among whom was Raghunathdas Madhowdas, J.P., who set a practical example by marrying a widow himself. They started two weekly papers, *The Rast Gofar* and *The Satyaprakash*, to influence public opinion. The part Karsandas took in the controversy that ensued was the chief work of his life. When the American Civil War gave an impetus to the cotton trade of Bombay in 1864, Karsandas was sent to England by a firm in Bombay as their agent, but this new movement did not thrive long. On his return in 1874 he was met by perse-

cution from his caste people. The Governor, Sir Bartle Frere, who had a high opinion of him, appointed him to administer the native state of Limree during the minority of the chief. He held that office till his death in 1875.

Karsandas Mulji's title to the memory of his co-religionists rests on his work as editor of *The Satyaprakash*, out of which the notorious "Maharaja" libel case arose. The hereditary chief priests of the Vaishnava community of Bombay are called Maharajas. They are descendants of the religious teacher Vallabhacharya (born in Champaran in Samvat 1535, A.D. 1479), and are like him believed to be incarnations of the god Krishna. Karsandas began about 1857 to denounce their avarice and immorality. The Maharajas tried in vain to silence the newspaper by threats of excommunication, and in order to avoid publicity, urged the passing of an Act to exempt them from personal attendance in courts of justice. After some years of religious polemics regarding female education and widow re-marriage, one Maharaja Jadunathji Brijratnji, in May 1861, filed an action for a libel contained in an article dated the 21st October 1860, in which Karsandas replied to the charge of heresy made by the Maharajas in their monthly magazine. Karsandas pleaded not guilty, and also justification, urging that the plaintiff and the other Maharajas carried into practice the carnal knowledge of female worshippers which is inculcated in the religious works explaining the Pushtimarga rule of life, and exalted by the Vallabhacharya sect into a new creed. At a meeting of the Bhattia caste, on the 6th September 1861, in order to suppress evidence of notorious immoralities, it was resolved that no one should bear witness against the plaintiff under the penalty of excommunication. The undaunted Karsandas thereupon charged the instigators of this resolution with conspiracy to defeat justice, and on conviction some of them were heavily fined. The trial of the libel case began in the Supreme Court on the 26th January 1862, and, after a lengthy hearing before Chief Justice Sir Mathew Sausse and Mr Justice Sir Joseph Arnould, the plaintiff was awarded nominal damages on the plea of not guilty, but both judges found that the charges of immoral dealings made by Karsandas were proved to be true. The Chief Justice held, nevertheless, that Karsandas had no right to publish them; but Sir Joseph Arnould was of the contrary opinion (on the authority of *Harrison v. Bush*, 5 Ellis and Blackburn), holding that as a Vallabhacharyan addressing his co-sectaries, and as a Banian addressing his caste fellows, he had a right, and as a journalist addressing readers composed principally of followers of the Maharajas, he had a duty to attack their misdeeds; for if such evils were to exist for ever without public animadversion, one of the great uses of a free press would be at an end. The result of the trial was a great victory for the reformers in the Vaishnava community. (For the dogma and history of the Vallabhacharyan religion, and details of the trial in the Supreme Court, see *History of the Sect of Maharajas or Vallabhacharyas of Western India*. London, Trübner and Co., 1865.) (N. B. W.)

Karwar, or CARWAR, a town of British India, administrative headquarters of North Kanara district in Bombay; on the sea-coast 295 miles south of Bombay city. Population (1881), 13,761; (1891), 14,579. Its commercial importance has declined since the opening of the Southern Mahratta railway system. There is a high school, with 279 pupils in 1896-97; and two printing-presses, issuing one vernacular newspaper.

Kashan, a small province of Persia, situated between Isfahan and Kum. It is divided into the two districts Gernsir, the "warm," and Sardsir, the "cold," the former with the city of Kashan in the plains, the latter in the hills. It has a population of 75,000 to 80,000, and pays a yearly revenue of about £18,000. KASHAN (Cashan) is the provincial capital, in 34° 0' N. and 51° 27' E., at an elevation of 3190 feet, 150 miles from Tehran; population, 25,000 to 30,000, comprising a few hundred Jews occupied as silk-winders, and a few Zoroastrians engaged in trade. Great quantities of silk stuffs, from raw material imported from Gilán, and copper utensils are manufactured at Kashan and sent to all parts of Persia. Kashan also exports rose-water made in some villages in the hilly district about 20 miles from the city, and is the only place in Persia where cobalt can be obtained, from the mine at Kamsar, 19 miles to the south.

Kashinath Trimbak Telang (1850–1893), a pious judge of the High Court, Bombay, was born at Bombay on 30th August 1850. By profession an advocate of the High Court, he was also a brilliant Sanskrit scholar. He took besides a vigorous share in literary, social, municipal and political work, as well as in the affairs of the University of Bombay, over which he presided as vice-chancellor from 1892 till his death. He was held in high esteem by Europeans in India, and his career is cherished by the native community as an example of varied eminence, attained by personal merits on the soil of India itself, circumstances having prevented him from ever visiting Europe. Telang grew up in a patriarchal family of Gaud Saraswat Brahmins, who derived their origin from Goa. He was the second son of Bapu, but was adopted by his uncle. At the age of five he was sent to the Amarchand Wadi vernacular school, and in 1859 entered the high school in Bombay which bears the name of Mountstuart Elphinstone. Here he came under the influence of Narayan Mahadev Purmanand, a teacher of fine intellect and force of character, afterwards one of Telang's most intimate friends. From this school he passed to the Elphinstone College, of which he became a fellow, and after taking the degree of M.A. and LL.B., decided to follow the example of Bal Mangesh Wagle, the first Indian admitted by the judges to practise on the original side of the High Court, a position more like the status of a barrister than a vakil or pleader. He passed the examination and was enrolled in 1872. His learning and other gifts soon brought him an extensive practice. He had complete command of the English language, and his intimacy with Sanskrit enabled him to study and quote the Hindu law-books with an ease not readily attained by European counsel. Mr Telang, finding his career assured, declined an offer of official employment. But in 1889 he accepted a seat on the High Court Bench, where his judgments are recognized as authoritative, especially on the Hindu law. He was syndic of the university from 1881, and vice-chancellor from 1892 till his death. In that year also he was elected president of the local branch of the Royal Asiatic Society. These two offices had never been held by a native of India before. His intimacy with Dr Wordsworth when at the Elphinstone College, his experience as professor of law, joined with his keen intellect and never-ceasing study, fitted Telang for the influential part he was called to take in many educational matters where both European methods and Oriental sentiments had to be considered. The decoration of C.I.E. conferred on him in 1882 was a recognition of his services as a member of a mixed commission appointed by the Government to deal with the educational system of the whole of India. He was nominated to the local legislative council in 1884, but declined a similar position on the Viceroy's council. Along with Mr P. M. Metha, he was the originator of the Bombay Presidency Association. When a student he had won the Bhugwandas scholarship in Sanskrit, and in this language his later studies were profound. His translation of the *Bhagwadgita* into English prose and verse is a standard work; and he criticized Professor Weber's hypothesis that the story of the *Ramayana* was influenced by the Homeric epics. While devoted to the sacred classics of the Hindus, Telang did not neglect his own vernacular, Mah-ratti literature being enriched by his translation of Lessing's *Nathan the Wise*, and an essay on *Social Compromise*. Mr Telang married a lady of the Kanvindé family, and left two sons and three daughters. Learned, judicial, and amiable, Telang was in his social life, like many other Brahmins, a man of plain living and high thinking. He spoke, wrote, and worked consistently for social reform, the elevation of women, the permission to widows to

remarry, female education, and so forth. He died at Bombay, 1st September 1893.

(N. B. W.)

Kashmir.—Since 1880 the Kashmir Durbar has resumed its authority over those outlying provinces stretching to the north-west, the administrative responsibility for which had been inherited by the Dogras from the Sikhs. The centre of these trans-Indus provinces is Gilgit, on the river of that name which joins the Indus where it takes its great bend to the south-west ere breaking through the Himalaya to the Peshawar plain. Kashmir had never loosed its hold on Gilgit, but Gilgit had never paid Kashmir tribute; so that the hold in 1885 was weak, and Kashmir authority, in some parts of the Gilgit basin, was set at naught. Kashmir suzerainty was even disputed by China. The late history of Kashmir consequently largely centres in the story of the establishment of the Gilgit Agency (in March 1889) and those subsequent events which hinged upon it, including expeditions to Chitral and the conquest of the valley of Hunza. Much of this, together with a general account of the geographical conformation and ethnology of the Gilgit province, will be found elsewhere (see GILGIT). Much has happened in the chequered history of the valley of Kashmir (that land of enchantment—the only land which never disappoints expectations) which requires a brief record. In September 1885 the Maharaja Sir Pratáp Singh, G.C.S.I., succeeded his father Zambir Singh, and at once inaugurated a series of most useful reforms. There is no longer a British officer on “special duty” in Kashmir, but a Resident who resides at Srinagar and Jammu, and who permanently represents the British Government in the Durbar. The political influence thus established reaches by proxy to Kashgar, to Leh (the capital of Ladakh), to Gilgit, and Chitral. The Resident at Srinagar is the warden of British India on the north. With the establishment of the Residency there has been an increase in the number of English visitors yearly, and a certain amount of British settlement in the country. The hill station of Gulmurg, in one of the glades on the northern slopes of the Pir Panjal, has sprung into existence. Here the construction of temporary residences is permitted by the Maharaja, and the European visitors to Srinagar follow the Resident in his summer migration to the hills. Round about Lake Dal there is already a scattering of pretty English villas, and the cultivation of fruit, hops, and vines has advanced beyond the experimental stages of 1890. A syndicate has been formed for the exploitation and working of the mineral wealth of the country, and a railway will place Srinagar in direct connexion with the Punjab. Meanwhile an immense improvement in the matter of roads has been effected. A good cart road now connects Murree with Baramulla, and Baramulla with Srinagar; and the transit by tonga over this road, with regular stages at intervals, is a delightful experience compared with the old wearisome monotony of daily marches. The distances from point to point of the route are as follows:—From the rail-head at Rawal Pindi to Murree is a drive of 40 miles—all uphill. From Murree to Kohála (where the Jhelum is bridged) is a downhill journey of 20 miles. Then, following the left bank of the Jhelum closely, there are 90 miles of road to Baramulla. From Baramulla to Srinagar a driving road of about 35 miles in length now supersedes the old boat journey through the Wulur lake by the Jhelum, although it can hardly afford the attraction of the placid, if somewhat indolent, method of drifting to the capital amidst the ever-varying scenery of the most beautiful country in the East. From Bandipur, on the northern edge of the Wulur, an excellent road now leads to Gilgit across the Tragbal pass, rising from 5200 feet

in the valley to 11,400 feet on the pass, and falling again into the sweet valley of Gurais before surmounting the Burzil (13,500 feet) and striking the Astor valley, which it follows to its junction with the Indus near Bunji. At Bunji the river is bridged. Here the height above sea-level is little over 4000 feet, and there is a comparatively gentle rise to Gilgit (4400 feet), although the road climbs over many a spur and skirts many a precipice in its course. Gilgit is by this route about 400 miles from the railway at Rawal Pindi. A route to Leh, which has been developed for trade purposes, now follows the Sind valley to its head under the Soji La (11,300), and then crosses the elevated Dras plateau to the Indus. This is the great trade artery of Kashmir and Tibet. The improvement in these main lines of communication, together with the introduction of telegraphs, has doubtless developed a certain amount of internal traffic; but it is a curious feature of this general commercial advance that the trade with Tibet has rather diminished than increased in value. The general increase in Kashmir trade may be gathered from the following statistics:—In 1892-93 the value of the exports (exclusive of treasure) was Rx.533,309, and the imports Rx.486,825. In the year 1896-97 the exports amounted to Rx.759,740, and the imports to Rx.702,842.

But undoubtedly the most beneficial measure introduced by the administration within late years was the land settlement in the Kashmir valley and the inauguration of an equitable assessment of property and crops. In the year 1887 the people were still in a condition of serfdom, with no rights and no power to represent their grievances. They were forced to labour and to sow, and others gathered the increase. Cultivation was bad, and the revenue was not paid. The character of the people, timid yet persistent, degraded yet intellectual, was the direct result of evil administration. Forced labour was imposed by local officialdom, and no heart was left in the labourers. Yet with the persistency of their forefathers, who had survived the despotism of Pathan, Moghul, Sikh, and Dogra, the Kashmiris clung to their land and their traditions; and they probably represent to this day a people historically older than any to be found in northern India still associated with the land of their ancestors. Remembering the beauty and the fertility of the vale of Kashmir, this is perhaps not so surprising as it would otherwise seem. There is but little crime amongst these people. They are a law-abiding race, as they were under their Hindu kings. Successive dynasties have left no impress on their national character. They are to-day what they were thousands of years ago. And at last the land settlement has brought a good measure of prosperity and contentment amongst them.

The revenues collected from the valley of Kashmir in 1880-89 amounted to—Land revenue, Rx.123,126, other sources, Rx.55,312; in 1893-94, land revenue, Rx.147,984, other sources, Rx.91,527. The valley comprises three districts (Khas, Anantnag, and Sopur) with eleven *tehsils*, independently of the districts of Mozafarabad, Gilgit, and Astor, and is under the executive charge of the Governor of Kashmir (the Hakim-i-Ala). Ladakh and Skardu are under the Governor of Jammu. In 1835 the population of the valley did not exceed 200,000, to which it had been reduced from 800,000 in twenty years by oppression, earthquake, pestilence, and famine. In 1866 a census (the accuracy of which, however, is doubtful) gave a population of 112,715. In 1873 another census returned the total population of the valley at rather under 500,000. Later, but before the famine, they were computed at 400,000. In 1877-79 there occurred the terrible scourge of famine, and the mortality which ensued has never been fully estimated. It seems probable that 67,000 people

died in the city (rather more than half of its inhabitants) and 175,000 in the villages (or about three-fifths of the population). A number of the chief valleys of the north were entirely deserted—whole villages lay in ruins, some suburbs of the city were tenantless, the city itself half destroyed, the graveyards were filled to overflowing, the river had been full of corpses thrown into it. In 1891 the population of the valley was 814,000, of whom 119,000 lived in Srinagar. Ninety-three per cent. of the people were Mahomedans, and the rest chiefly Hindus. In 1901 the population of the state of Kashmir numbered 1,157,759, of whom 122,536 were in Srinagar. The 1901 census gives for Jammu, Kashmir, Malakand, Chitral, and the neighbouring frontier states a total population of 2,906,173, as compared with 2,543,952 in 1891.

But the terrible famine of 1877-79 is not the only calamity to be recorded in the last quarter of the 19th century. In 1885 an earthquake occurred of long duration, which occasioned great loss of life. Three thousand five hundred people are believed to have perished. The most violent shocks were felt in an elliptical area whose focuses were Srinagar and Baramulla. The earthquake commenced on 30th May, and shocks were felt up to 16th August. Villages were destroyed and panic was universal. Old water springs disappeared and landslips occurred frequently. Large earth fissures appeared about Baramulla and Patan.

In 1892 between 11,000 and 12,000 persons died of cholera in the Kashmir valley, and the horror and demoralization of that terrible visitation are still vivid in the minds of the people. Villages were deserted, cultivation was abandoned, and business entirely stopped. Men would not lend money, and in the villages the people would sit all day long about the graveyards, absolutely silent. The long lines of coffins borne to the burial-grounds resembled an endless regiment on the march, while on the river a sad procession of boats floated down to the burning ghats, and living passengers in other boats passed by with averted faces.

Truly, if Kashmir is the land of Oriental ideal around which have been woven endless tales in prose and song—a theme for romance, offering wide fields for revels of imagination or for the exercise of vivid description—it is a land of calamity also; a land of grim, gray catastrophe and horror, such as is hardly known in countries less fair. But a brighter dawn has already broken, and the chequered light and shadow of her late history are rapidly yielding to the broad day of contentment and prosperity.

See DREW. *Jammu and Kashmir*.—LAURENCE, W. R. *The Valley of Kashmir*, London, 1895.—DURAND, Col. A. *The Making of a Frontier*, London, 1899.—LYDEKKE, R. "The Geology of the Kashmir and Chamba Territories," *Records of the Geological Survey of India*. (T. H. H*.)

Kasimoff, a district town of Russia, government and 90 miles east-north-east of Ryazan, on Oka river. The population in 1897 was 13,500, of whom about 1000 are Tatars (about 5000 in the district). It is a wealthy town, well provided with educational institutions, and famed for its tanneries and leather goods, sheepskins and bells, these trades giving occupation to nearly 4000 persons. It was founded in 1152. In the 15th century it became the capital of a Tatar khanate, vassal to and patronized by Moscow, as a rival to Kazan, and contains interesting antiquities.

See VELIAMINOFF-ZERNOFF'S *The Kasimoff's Tsars*. St Petersburg, 1863-77.

Kassa (*Kaschau*), a municipal town of Hungary, capital of the county of Abauj-Torna. Formerly the chief town of Upper Hungary, it is still in respect of industry, commerce, and traffic the centre of the north-eastern part of the country. Its most important manufactures are

tobacco, machinery, iron, furniture, and textiles; there are many steam mills. Population (1890), 28,884; (1900), 40,101.

Kastamúni, or **KASTAMBÚL**.—1. A viláyet of Asia Minor which includes Paphlagonia and parts of Pontus and Galatia. It is divided into four sanjaks—Kastamúni, Boli, Changra, and Sinope—is rich in mineral wealth, and has many mineral springs and extensive forests. Its population comprises 1,000,000 Moslems and 30,000 Christians. 2. The capital of the above, the ancient *Castamon*, altitude 2500 feet, situated in the narrow valley of the Geuk Irmak (*Amniás*), and connected by a carriage road, 54 miles, with its port Ineboli on the Black Sea. The town is noted for its copper utensils, and it has a large trade in mohair. The climate, though subject to extremes of heat and cold, is healthy; in winter the roads are often closed by snow. The population of 17,000 includes 2900 Christians. Castamon, an important city in later Byzantine times, was taken by the Danishmand Emirs of Sivas early in the twelfth century.

Katha, a district in the northern division of Upper Burma, with an approximate area of 7000 square miles, 3000 of which consist of the former separate state of Wuntho. It is bounded on the N. by the Upper Chindwin, Bhamo, and Myitkyina districts, on the E. by the Kaukkwe river as far as the Irrawaddy, thence east of the Irrawaddy by the Shan State of Mōna Mit (Momeik), and by the Shweli river, on the S. by the ruby mines district and Shwebo, and on the W. by the Upper Chindwin district. There are three ranges of hills running through the district, known as the Minwun, Gangaw, and Mangin ranges. They separate the three main rivers—the Irrawaddy, the Mēza, and the Mu. The Minwun range runs from north to south, and forms for a considerable part of its length the dividing line between the Katha district proper and what formerly was the Wuntho state. Its average altitude is between 1500 and 2000 feet. The Gangaw range runs from the north of the district for a considerable portion of its length close to and down the right bank of the Irrawaddy as far as Tigyaing, where the Myatheindan pagoda gives its name to the last point. Its highest point is 4400 feet, but the average is between 1500 and 2000 feet. The Katha branch of the railway crosses it at Petsut, a small village 12 miles west of Katha town. The Mangin range runs through Wuntho. Its highest peak, *Mangthōn*, attains an altitude of 5450 feet.

Gold, copper, iron, and lead are found in considerable quantities in the district. The Kyaukpazat gold mines, worked by an English company, give good returns. The iron, copper, and lead are not now worked. Jade and soapstone also exist, and salt is produced from brine wells. There are three forest reserves in Katha—the Upper Mēza range with 234 square miles, the Lower Mēza range with 188 square miles, and the Irrawaddy range, which is under process of constitution. The population according to the census of 1891 was as follows:—Europeans and Eurasians, 78; other mixed classes, 1400; Hindus, 500; Mahomedans, Burmese, Shans, and Kadus, 105,796; aboriginal races, mainly Kachins, 3814—a total of 111,588; and in 1901, 176,514, of whom 86,790 were males and 89,724 females. The number of Shans is about half that of Burmese, and of Kadus half that of Shans. The Shans are mostly in the Wuntho subdivision. Rice is the chief crop in the plains, tea, cotton, sesamum, and hill rice in the hills. The valley of the Mēza, which is very malarious, was used as a convict settlement in Burmese times. The district was first occupied by British troops, but it was not finally quieted till 1890, when the Wuntho Sawbwa was deposed and his state incorporated in the Katha district.

KATHA, the headquarters of the district, contained 486 houses in 1897. The principal public buildings are the courthouse, jail, hospital, bazaar, telegraph and post offices, military and civil police lines, railway station and wood depot, dāk bungalow and public works department offices. The principal means of communi-

cation are the Irrawaddy Flotilla steamers, which run between Mandalay and Bhamo, and the railway which communicates with Sagany to the south and Myitkyina to the north. A ferry-boat plies between Katha and Bhamo. (J. G. Sc.)

Kathiawar, or **KATTYWAR**, a peninsula of India, within the Gujarat division of Bombay, giving its name to a political agency. Total area, about 23,300 square miles; population, 3,000,000. These figures include a portion of the British district of Ahmedabad, a portion of the state of Baroda, and the small Portuguese settlement of Diu. The political agency of Kathiawar has an area of 20,559 square miles; population (1881), 2,343,899; (1891), 2,752,404, showing an increase of 17 per cent.; average density, 134 persons per square mile. In 1901 the population was 2,327,456, showing a decrease of 15 per cent., due to the results of famine. The estimated gross revenue was Rs.1,98,19,520; total tribute, Rs.11,35,000.

There are altogether 188 states of varying size and importance, of which 14 exercise independent jurisdiction, while the rest are more or less under British administration. Most of them pay tribute to the British Government, the Gaekwar of Baroda, or the Nawab of Junagarh; but the tribute is always collected by British officials. The seven states of the first class are Junagarh, Nawana-gar, Bhaunagar, Porbandar, Dhrangadra, Morvi, and Gondal. The headquarters of the political agent are at Rajkot, in the centre of the peninsula, where also is the Rajkumar College, for the education of the sons of the chiefs. There is a similar school for *girasias*, or chiefs of lower rank, at Gondal. In 1897-98 the total number of schools was 1334, with 85,569 pupils, being 3.1 per cent. of the population, compared with 2.4 per cent. for the whole of Bombay. An excellent system of metre-gauge railways has been provided at the cost of the leading states. Maritime trade is also very active, the chief ports being Porbandar, Mangrol, and Verawal. In 1897-98 the sea-borne exports were valued at Rs.2,01,06,931, and the imports at Rs.2,39,31,523. The progressive prosperity of Kathiawar received a shock from the famine of 1899-1900, which was felt everywhere with extreme severity. The monsoon again failed in 1901.

Katkoff, Michael Nikiforovitch (1818-1887), Russian journalist, was born in Moscow in 1818. On finishing his course at the university he devoted himself to literature and philosophy, and showed so little individuality that during the reign of Nicholas I. he never once came into disagreeable contact with the authorities. With the Liberal reaction and strong reform movement which characterized the earlier years of Alexander II.'s reign (1855-81) he thoroughly sympathized, and for some time he warmly advocated the introduction of liberal institutions of the British type, but when he perceived that the agitation was assuming a Socialistic and Nihilist tinge, and that in some quarters of the Liberal camp indulgence was being shown to Polish national aspirations, he gradually modified his attitude until he came to be regarded by the Liberals as a renegade. At the beginning of 1863 he assumed the management and editorship of the *Moscow Gazette*, and he retained that position till his death in 1887. During these twenty-four years he exercised considerable influence on public opinion and even on the Government, by representing with great ability the moderately Conservative spirit of Moscow in opposition to the occasionally ultra-Liberal and always cosmopolitan spirit of St Petersburg. With the Slavophiles he agreed in advocating the extension of Russian influence in south-eastern Europe, but he carefully kept aloof from them and condemned their archaeological and ecclesiastical sentimentality. Though generally temperate in his views, he was extremely incisive and often violent in his modes of expressing them, so that he made many enemies and sometimes incurred the displeasure of the press-censure and the ministers, against which he was more than once protected by the emperor Alexander III. in consideration of his able advocacy of national interests. His frequent changes of opinion are now forgotten, and he is remembered chiefly as an energetic opponent of

Polish national aspirations, of extreme Liberalism, of the system of public instruction based on natural science, and of German political influence. In this last capacity he helped to prepare the way for the Franco-Russian alliance. (D. M. W.)

Katrine, Loch, a Scottish lake, lying between Stirling and Perth shires, 364 feet above the sea. It has an area of about 4000 acres, and a maximum depth of 78 fathoms. Glengyle water and nearly fifty rivulets feed it, and it is drained by Achray water and by the tunnels of the Glasgow waterworks. Since 1859 it has been the principal source of the water-supply of Glasgow, and the surface has been raised 5 feet in order to increase the capacity, which, along with that of Loch Arklet, with which it is connected, is 12,000 million gallons. One consequence of the raising of the level was the submergence of the Silver Strand and an appreciable lessening of the size of Ellen's Isle.

Kattowitz, a town of Prussia, province of Silesia, 5 miles south-south-east of Beuthen. It lies in the midst of ironworks and coal mines, and has flour mills and manufactures of glass, machinery, and household utensils. Population (1885), 14,200; (1900), 31,745.

Kaufbeuren, a town of Bavaria, Germany, district of Swabia, on the Wertach, 55 miles by rail south-west of Munich. It is still surrounded by walls, and has a new town hall. It is a seat of the cotton industries. Population (1885), 6495; (1900), 8361.

Kaufmann, Constantine Petrovitch (1818–1882), Russian general, was born at Maidani on 3rd March 1818. He entered the Imperial Engineers in 1838, served in the army of the Caucasus, rose to be colonel, and commanded the sappers and miners at the siege of Kars in 1855. On the capitulation of Kars he was deputed to settle the terms with General Sir W. Fenwick Williams. He was promoted to be major-general in 1857, and in 1861 became director-general of engineers at the War Office at St Petersburg, assisting General Milutin in the reorganization of the army. Promoted lieutenant-general in 1864, he was nominated aide-de-camp-general and governor of the military conscription of Vilna. In 1867 he became governor of Turkestan, and held the post until his death, making himself a name in the expansion of the empire in central Asia. He accomplished a successful campaign in 1868 against Bokhara, capturing Samarkand and gradually subjugating the whole country. In 1873 he attacked Khiva, took the capital, and forced the khan to become a vassal of Russia. Then followed in 1875 the campaign against Khokand, in which Kaufmann defeated the khan, Nasr-ed-din. Khokand north of the Syr-daria was annexed to Russia, and the independence of the rest of the country became merely nominal. This rapid absorption of the khanates brought Russia into close proximity to Afghanistan, and the reception of Kaufmann's emissaries by the Amir was a main cause of the British war with Afghanistan in 1878. Although Kaufmann was unable to induce his Government to support all his ambitious schemes of further conquest, he sent Skobelev in 1880 and 1881 against the Akhal Tekké, and was arranging to add Merv to his successful annexations when he died suddenly at Tashkend on 15th May 1882. (R. H. V.)

Kaukauna, a city of Outagamie county, Wisconsin, U.S.A., on the Fox river and the Chicago and North-Western railroad. It has paper and pulp mills. Population (1880), 834; (1890), 4667; (1900), 5115, of whom 1044 were foreign-born.

Kavala, or **CAVALLA**, a town of Turkey, on the

shore of the Bay of Kavala, behind the Ægean island of Thasos. Its resident population of about 17,000 is increased in summer by an influx of peasantry, of whom during the season 5000 to 6000 are employed in curing, drying, and preparing for export the tobacco which is the speciality of the town, and which engrosses all its agricultural, industrial, and commercial energies. The production more than doubled in the last twenty years of the 19th century. It is now largely bought by the State monopolies of Austria-Hungary, Italy, Rumania, and Servia, and is making way in Germany, Great Britain, Russia, and the United States. The crop of 1898 produced 16,000 tons of marketable tobacco, and that of 1899 was even larger. In 1900, out of a total export value of £1,220,670, over £1,193,220 was for tobacco. The total imports average about a quarter of a million sterling. The house in which Mehemet Ali was born—a mean little structure in one of the tortuous streets of the old town—is still standing. It is distinguishable by a plate which the authorities have affixed to it.

Kavanagh, Arthur Macmorrough (1831–1889), Irish politician, son of Thomas Kavanagh, M.P., who traced his descent to the ancient kings of Leinster, was born in Co. Carlow, Ireland, 25th March 1831. He had only the rudiments of arms and legs, but in spite of these physical defects had a remarkable career. He learnt to ride in the most fearless way, strapped to a special saddle, and managing the horse with the stumps of his arms; and also fished, shot, drew, and wrote, various mechanical dodges being devised to supplement his limited physical capacities. He travelled extensively in Egypt, Asia Minor, Persia, and India between 1846 and 1853, and after succeeding to the family estates in the latter year, he married in 1855 his cousin, Miss Frances Mary Leathley. Assisted by his wife, he was a most philanthropic landlord, and was an active county magistrate and chairman of the board of guardians. A Conservative and a Protestant, he sat in Parliament for Co. Wexford from 1866 to 1868, and for Co. Carlow from 1868 to 1880. He was opposed to the disestablishment of the Irish Church, but supported the Land Act of 1870, and sat on the Bessborough Commission. In 1886 he was made a member of the Privy Council in Ireland. He died of pneumonia 25th December 1889, in London. It is supposed that his extraordinary career suggested the idea of "Lucas Malet's" novel, *The History of Sir Richard Calmady*.

Kazañ, a government of middle Russia, at the confluence of the Volga with the Kama. Area, 24,601 square miles. Population (1879), 1,872,437; (1897), 2,191,058, of whom 1,113,555 were women, and 176,396 lived in towns. It consisted of Russians (885,683 out of a total of 2,221,100 in 1893), Tatars (688,650), and a variety of Finno-Turkish stems: Chuvashes (482,260), Cheremisses (118,511), Mordves (26,648), Votyaks (8792), Mescheryaks (3628); some Jews (2829), some Poles (2702), &c. The Russians belong to the Greek Church or are Nonconformists; the Tatars are Mussulmans, and the other Finno-Turkish stems are either pagans or belong officially to the Greek Church, the respective figures being (in 1893): Greek Orthodox, 1,529,235; Nonconformists, 24,112 (more in reality); other Christian religions, 4025; Mussulmans, 648,877; Jews, 2367; pagans, 12,462. The average natural yearly increase of population (slightly in excess among the Russians) was about 25,000; marriages about 18,000.

Agriculture is the chief occupation, and 82 per cent. of the population are peasants. Out of 7,672,600 acres of arable land, 4,516,500 were under crops—chiefly rye, oats, some wheat, barley,

sarrazin, lentils, flax, hemp, and potatoes. The crops leave on an average year an available surplus of about 1,450,000 quarters, resulting in a great scarcity and even famine in bad years. There are 450,000 horses, 300,000 horned cattle, 1,200,000 sheep, 100,000 swine, and 32,000 goats. Bee-keeping is an important branch of income. Factories occupy only about 10,000 persons, and show a yearly return of about £1,500,000. A great variety of petty trades, especially those connected with wood, are carried on in the villages, partly for export. The fairs are well attended. There is considerable shipping on the Volga, Kama, Vyatka, and their tributaries, the yearly returns of the aggregate shipping on the first two rivers being estimated at from £800,000 to £1,100,000. The schools are very unequally distributed in the different districts of the province, and are attended mainly by the Russians and the Chuvashes, but not by the Mussulman children. There were, in 1892, 1238 schools, of which 101 were at Kazañ. The village schools were visited by 40,209 boys and 11,039 girls. A seminary for teachers, 12 Russian schools, and 682 *medresses* and *mektebs* gave education to 20,930 Mussulman boys and 12,295 girls. Kazañ is divided into twelve districts, the chief towns of which are Kazañ, Cheboksary (4568 inhabitants), Chistopol (20,161), Kozmodemyansk (5172), Laishiev (3743), Mamadyzh (4213), Spassk (2779), Sviyazhsk (2363), Tetyushi (4754), Tsarevokokshaik (1654), Tsyvilsk (2337), and Yadrin (2467).

Kazañ, capital of the above government, 50 miles above the confluence of the Volga with the Kama, and 5 miles from the left bank of the Volga, one of the chief cities of eastern Russia. It has not yet been brought into direct railway communication with Moscow, and is situated 276 miles to the east of the Nijni-Novgorod railway terminus; but it has been connected by a branch line with Saransk on the Ryazañ-Samara line (head of the Siberian railway). It is probably on this account that its population, which rapidly increased from 1850 to 1883, when it reached 140,726, has since decreased (125,889 in 1889), and only rose to 131,508 in 1897. Russians form 83 per cent. of its population and Tatars 11 per cent. The city has been embellished by several churches and public buildings. The university of Kazañ, to which students flock from north-east, east, and south-east Russia, as well as from Siberia, has an average of about 800 students, an excellent library (150,000 vols.), good laboratories, an observatory, a botanical garden, and a variety of museums (relics of Bulgarian antiquities at the Archaeological Society; Persian moneys and Arabian MSS., both described in special works). Nine scientific and medical societies connected with the university, and issuing their special serials, are important centres for the study of north-east and east Russia and for scientific research. The factories (100) show a yearly return of about £900,000. Soap and candle works, tanneries and metal works are the chief. Kazañ is also a very important centre for trade, not only with eastern Russia, but also with Turkestan, Bokhara, and Persia.

See PINEGHIN'S *Kazañ New and Old.—Towns and Villages on the Volga*, by the Statistical Committee; *Year-books* of the same.—V. VELIAMINOFF ZERNOFF'S *Kasimoff Tsars and Tsarevitchs*. St Petersburg, 1864, 3 vols.—ZARINSKY'S *Sketches of Old Kazañ*. Kazañ, 1877.—TROFIMOFF'S *The Siege of Kazañ in 1552*. Kazañ, 1890.—N. A. FIRSOFF'S works relative to the history of the native population. Kazañ, 1864 and 1869. (P. A. K.)

Kazanskaya.—1. A Cossack village of south-east Russia, province of Don Cossacks, district Donets, on the left bank of the upper Don, 165 miles north-north-east of Kamenskaya. It has rapidly developed, owing to its trade in cattle and horses, and its vineyards. Population, 16,970. 2. Another Cossack village of same name, in North Caucasia, government and 92 miles west-north-west of Stavropol, on Kubañ river. It has become a centre of home industries for the weaving of coarse linen and knitting of woollen hosiery. Population, 6550.

Kazbek (Georgian, *Mkin-vari*; Ossetian, *Urs-khokh*), one of the chief summits of the Caucasus (the sixth in order of altitude), 42° 41' 56" N. and 44° 29' 48" E., altitude 16,546 feet, 7 miles as the crow flies from a station of the

same name on the high road to Tiflis. It rises at the eastern extremity of the high range which runs to the north of the main range (main water-parting), and which is pierced by the gorges of the Ardon and the Terek. It represents an extinct volcano covered with lava, and has the shape of a double cone, whose base lies at an altitude of about 5700 feet. Owing to the steepness of its slopes, its eight glaciers cover only an aggregate surface of 8 square miles, and the longest of them, Ortz-veri, is only 5 miles long with its *nevé* and 2½ miles without it. The best-known glacier is the Devdorak, which creeps down the north-eastern slope into a gorge of the same name, reaching a level of 7580 feet with its snout. Its fall being very steep, and its snout being only 3-4 miles from the military highway, masses of ice and snow occasionally fall down upon the latter. Parrot and Engelhardt made the first attempt to climb up Kazbek in 1811, but reached only a height of 13,863 feet; neither Meyer in 1829 (14,840 feet) nor Colenati in 1844 (14,547 feet) reached the summit, which was first attained in 1868 by Freshfield, Moore, and Tucker, with a Swiss guide. Several successful ascents have been made since, the most valuable in scientific results being that of Pastukhoff (1889). Kazbek has a great literature, and has left a deep mark in Russian poetry (see D. W. Freshfield in *Proceedings Geogr. Soc.*, Nov. 1888, and *The Exploration of the Caucasus*, 2 vols., 1896; Hatisian's "Kazbek Glaciers," in *Izvestia Russ. Geogr. Soc.* xxiv. 1888; Pastukhoff in *Izvestia of the Caucasus Branch of Russ. Geogr. Soc.* vol. x. 1. 1891, with large-scale map).

Kazvín, a province of Persia, situated north-west of Tehran and south of Gilán. On the west it is bounded by Khamseh. It pays a yearly revenue of about £22,000, and contains many important and rich villages which produce much grain. Kazvín, the capital of the province, is situated at an elevation of 4165 feet, in 36° 15' N. and 50° E., and 92 miles by road from Tehran. It has a population of about 35,000, and a thriving transit trade, particularly since the carriage road between Rasht and Tehran, with Kazvín as half-way stage, was opened. It has a telegraph station (since 1859) and a post office (since 1876). It is the birthplace of several celebrated writers (mentioned in the earlier volumes), notably of Hamd Ullah Mustoff, postmaster-general in the beginning of the 14th century, author of the *Nuzhat ul Kulûb*, the *Tárîkh i guzîdeh*, and the *Zafar námeh*, the last a very rare MS. obtained by the British Museum a few years ago.

Kearney, capital of Buffalo county, Nebraska, U.S.A., in the broad bottom-lands of the Platte river on the north side, at an altitude of 2152 feet. Its site is level and its plan regular. It is on the main overland line of the Union Pacific, and on a branch of the Burlington and Missouri River railroad. It is in a very fertile agricultural region, with whose development it has kept pace. Population (1880), 1782; (1890), 8074; (1900), 5634, of whom 650 were foreign-born.

Kearsley, a township in the Radcliffe-cum-Farnworth parliamentary division of Lancashire, England, 4 miles south-east of Bolton, with a station on the Lancashire and Yorkshire railway. Besides the parish church of St Stephen, there are Congregational, Wesleyan, Primitive Methodist, and Swedenborgian places of worship. The industries are coal-mining, iron-founding, paper-making, and cotton-spinning. Area of township and urban district, 997 acres; population (1881), 7253; (1901), 9217.

Kecskemét, a municipal town of Hungary, in the county of Pest-Pilis-Solt-Kis-Kun, with 48,493 inhabitants in 1890 and 57,812 in 1900. Besides raising cereals,

fruit is extensively cultivated, and there is a considerable production of wine. More than a million baskets of fine apples and apricots are yearly exported.

Keeley, Mary Anne (1806–1899), English actress, was born at Ipswich, 22nd November 1805 or 1806. Her maiden name was Goward. She went on the stage at an early age, and, after some experience in the provinces, appeared in London in 1825. So far she had principally undertaken "singing parts," but it was not long before she gave these up in favour of the drama proper, where her powers of character-acting could have scope. In June 1829 she was married to Robert Keeley, an admirable comedian, who died in 1869. Between 1832 and 1838 she acted at Covent Garden, at the Adelphi with Buckstone, and at the Olympic with Charles Mathews. Late in 1838 she made her first great success in the part of Nydia, the blind girl, in a dramatized version of *The Last Days of Pompeii*, and followed this with an equally striking impersonation as SMike in *Nicholas Nickleby*. In 1839 came her decisive triumph with her picturesque and spirited acting as the hero of a play founded upon Harrison Ainsworth's *Jack Sheppard*. So dangerous was considered the popularity of the play, with its glorification of the prison-breaking felon, that the Lord Chamberlain ultimately forbade the performance of any piece upon the subject. It is perhaps mainly as Jack Sheppard that Mrs Keeley has lived in the memory of playgoers who saw her, despite her long subsequent career in plays more worthy of her remarkable gifts. Under Macready's management at Drury Lane she played Nerissa in *The Merchant of Venice*, and Audrey in *As You Like It*; managed the Lyceum with her husband from 1844 to 1847; acted with Webster and Kean at the Haymarket; returned for five years to the Adelphi; and eventually made her last regular public appearance at the Lyceum in 1859. From that time she appeared upon the boards only to assist at benefits and similar performances. In spite of the great age she attained, she preserved an altogether exceptional vigour and youthfulness of disposition until the short illness which terminated in her death on 12th March 1899.

(R. F. S.)

Keeling Islands (often called Cocos, and Cocos-KEELING ISLANDS), a group of coral islands in the Indian Ocean, between 12° 4' and 12° 13' S. and 96° 49'–57' E., but including a smaller island in 11° 50' N. and 96° 50' E. They were discovered in 1609 by Captain Keeling on his voyage from Batavia to the Cape, were in 1878 (after several years of existence as an independent possession of the Crown) attached to the Government of Ceylon, and eventually in 1882 were placed under the authority of the governor of the Straits Settlements. Since Forbes's account of his sojourn in 1878, the islands have been visited, at the expense of Sir John Murray, the distinguished naturalist of the *Challenger*, by Dr Guppy, Mr Ridley, and Dr Andrews. The object of their visits was the investigation of the fauna and flora of the atoll, more especially of the formation of the coral reefs, the account of which by Darwin (who spent a short period on the group in 1836 on his voyage in the *Beagle*) made the islands classic ground, as it was from the observations he there made that his celebrated theory of the formation of coral reefs was founded. Dr Guppy was fortunate in reaching North Keeling Island, which, as it can be landed on only during the calmest weather, has very seldom been visited. The island he found to be about a mile long, with a shallow enclosed lagoon, less than 3 feet deep at ordinary low water, with a single opening leading into it on its east or weather side. A dense vegetation of iron-wood (*Cordia*) and other

trees and shrubs, together with a forest of cocoanut palms, covers its surface. It is tenanted by myriads of sea-fowl, frigate-birds, boobies, and terns (*Gygis candida*), which find here an excellent nesting-place, free from disturbance, for the island is uninhabited, and is visited by the owner (Mr J. Clunies Ross) only once or twice a year for the purpose of gathering its produce. The excrement from this large colony has changed the carbonate of lime in the soil and the coral nodules on the surface into phosphates, to the extent in some cases of 60–70 per cent., thus forming a valuable deposit, beneficial to the vegetation of the island itself and probably yet to be of commercial value. The lagoon is slowly filling up and becoming cultivable land, but the rate of recovery from the sea has been specially marked since the eruption of Krakatoa, the pumice from which has been washed on to it in enormous quantity, so that the lagoon has advanced its shores from 20 to 30 yards. There is an anchorage on the west side of the island; but, unless in dead calm weather, it must be used with the utmost caution, as a northerly wind suddenly arising would place a vessel in the greatest jeopardy. Forbes's and Guppy's investigations go to show that, contrary to Darwin's belief, there is no evidence of upheaval or of subsidence in either of the Keeling groups. The atoll has an exceedingly salubrious climate, and it might well be used as a sanatorium for phthisical patients, the temperature never going to extremes. The highest annual reading of the thermometer almost never tops 89° F. or falls beneath 70°. The mean temperature for the year is 78·5° F., and as the rainfall rarely exceeds 40 inches, the atmosphere never becomes unpleasantly moist. The south-east trade blows almost ceaselessly for ten months of the year. Both groups of the Keelings continue under the proprietorship of Mr Ross. A profitable trade is done in cocoanuts, of which the islands, now nearly all fully planted, yield an enormous number. There are few other exports. The imports are almost entirely food-stuffs and other necessaries for the inhabitants, who are all practically the dependants of, and form a patriarchal colony under, Mr Ross, who is the Crown's representative as well as absolute owner, as he holds from the Government under a lease of a thousand years.

Keene, Charles Samuel (1823–1891), English black-and-white artist, the son of Samuel Browne Keene, a solicitor, was born at Hornsey on the 10th of August 1823. Educated at the Ipswich Grammar School until his sixteenth year, he early showed artistic leanings. Two years after the death of his father he was articled to a London solicitor, but, the occupation proving congenial, he was soon removed to the office of an architect, Mr Pilkington. His spare time was now spent in drawing historical and nautical subjects in water-colour. For these trifles his mother, to whose energy and common-sense he was greatly indebted, soon found a purchaser, through whom he was brought to the notice of the Whympers, the wood-engravers. This led to his abandoning his work as an architect and being bound to them as apprentice for five years. His earliest known design is the frontispiece, signed "Chas. Keene," to *The Adventures of Dick Boldhero in Search of his Uncle*, &c. (Darton and Co., 1842). His term of apprenticeship over, he hired as studio an attic in the block of buildings standing, up to 1900, between the Strand and Holywell Street, and was soon hard at work for the *Illustrated London News*. At this time he was a member of the "Artists' Society" in Cleftone Street, afterwards removed to the Langham studios. In December 1851 he made his first appearance in *Punch* and, after

THRIFT.

Peebles Body (to Townsman who was supposed to be in London on a visit)
 "E—EH, MAC! YE'RE SUNE HAME AGAIN!"
Mac. "E—EH, IT'S JUST A RUINOUS PLACE, THAT! MUN, A HAD NA' BEEN
 TIE-ERRE ABUNE TWA HOURS WHEN—BANG—WENT SAXPENCE!!!"

"THE UNSEEN WORLD."

Scientific Gent (with his hair on end). "VE'Y STRANGE! BUT I COULD ALMOST
 SWEAR—I HEAR FOO'S STEPS—FOLLOWIN' ME DOWNSTAIRS——!"
 [Bolts into his bedroom, locks the door, and writes to the "Athenæum" next day!]

"THAT NASTY ORANGE-PEEL!"

Gallant Old Gentleman (rushing to her assistance). "I'M AFRAID, MA'AM, YOU'VE HAD A FALL—I HOPE——"
Short-tempered Old Lady (snappishly). "WHY, YOU DON'T S'POSE I'D SIT DOWN HERE, YOU OLD STUP——!"
 [He helps her up, and makes off hastily.]

Illustrations by CHARLES KEENE. (By permission of the Proprietors of "Punch.")

nine years of steady work, was called to a seat at the famous table. It was during this period of probation that he first gave evidence of those transcendent qualities which make his work at once the joy and despair of his brother craftsmen. On the starting of *Once a Week* in 1859, Keene's services were at once requisitioned, his most notable series in this periodical being the illustrations to Charles Reade's *A Good Fight* (afterwards rechristened *The Cloister and the Hearth*) and to Mr George Meredith's *Evan Harrington*. There is a quality of conventionality in the earlier of these which completely disappears in the later. In 1858 Keene, who was endowed with a fine voice and was an enthusiastic admirer of old-fashioned music, joined the "Jermyn Band," afterwards better known as the "Moray Minstrels." He was also for many years a member of Leslie's Choir, the Sacred Harmonic Society, the Catch, Glee, and Canon Club, and the Bach Choir. He was also an industrious performer on the bagpipes, of which instrument he brought together a considerable collection of specimens. About 1863 the Arts Club in Hanover Square was started, with Keene as one of the original members. In 1864 John Leech died, and Keene's work in *Punch* thenceforward found wider opportunities. It was about this time that the greatest of all modern artists of his class, Menzel, discovered Keene's existence, and became a subscriber to *Punch* solely for the sake of enjoying week by week the work of his brother craftsman. In 1872 Keene, who, though fully possessed of the humorous sense, was not within measurable distance of Leech as a jester, and whose drawings were consequently not sufficiently "funny" to appeal to the laughter-loving public, was fortunate enough to make the acquaintance of Mr Joseph Crawhall, who had been in the habit for many years of jotting down any humorous incidents he might hear of or observe, illustrating them at leisure for his own amusement. These were placed unreservedly at Keene's disposal, and to their inspiration we owe at least 250 of his most successful drawings in the last twenty years of his connexion with *Punch*. A list of more than 200 of these subjects is given at the end of *The Life and Letters of Charles Keene of "Punch"*. In 1879 Keene removed to 239 King's Road, Chelsea, which he occupied until his last illness, walking daily to and from his house, 112 Hammersmith Road. In 1881 a volume of his *Punch* drawings was published by Messrs Bradbury and Agnew, with the title *Our People*. In 1883 Keene, who had hitherto been a strong man, developed symptoms of dyspepsia and rheumatism. By 1889 these had increased to an alarming degree, and the last two years of his life were passed in acute suffering borne with the greatest courage. He died unmarried, after a singularly uneventful life, on the 4th of January 1891, and his body lies in Hammersmith cemetery. Keene, who never had any regular art training, was essentially an artists' artist. He holds the foremost place amongst English craftsmen in black and white, though his work has never been appreciated at its real value by the general public. No doubt the main reason for this lack of public recognition was his unconventionality. He drew his models exactly as he saw them, not as he knew the world wanted to see them. He found enough beauty and romance in all that was around him, and, in his *Punch* work, enough subtle humour in nature seized at her most humorous moments to satisfy him. He never required his models to grin through a horse collar, as Gillray did, or to put on their company manners, as was du Maurier's wont. But Keene was not only a brilliant worker in pen and ink. As an etcher he has also to be reckoned with, notwithstanding the fact that his plates numbered not more than fifty at the outside. Impressions of them are exceedingly rare, and

hardly half a dozen of the plates are now known to be in existence. He himself regarded them only as experiments in a difficult but fascinating medium. But in the opinion of the expert they suffice to place him among the best etchers of the 19th century. Apart from the etched frontispieces to some of the *Punch* pocket-books, only three, and these by no means the best, have been published. Writing in *L'Artiste* for May 1891 of a few which he had seen, M. Bracquemond says: "By the freedom, the largeness of their drawing and execution, these plates must be classed amongst modern etchings of the first rank." A few impressions are to be found in the British Museum, but in the main they were given away to friends and lie hidden in the albums of the collector.

(G. S. L.)

Keene, capital of Cheshire county, New Hampshire, U.S.A., on the Ashuelot, and on branches of the Boston and Maine and the Fitchburg railways. Its site is a level plain, on which it is regularly laid out, with broad, well-shaded streets, and it has an excellent water-supply. It has varied manufactures, including the repairing-works of the Fitchburg railroad. Population (1880), 6784; (1900), 9165, of whom 1255 were foreign-born.

Keewatin, a district of Canada, bounded on the E. by Committee Bay, Fox Channel, and Hudson and James Bays, on the S. and S.W. by the Albany and English rivers, Manitoba, Lake Winnipeg, and Nelson river, on the W. by the 100th meridian, and on the N. by Simpson and Rae straits and gulf and peninsula of Boothia; thus including an area of 445,000 square miles. Its surface is in general barren and rocky, studded with innumerable lakes with intervening elevations, forest-clad below 60° N., but usually bare or covered with moss or lichens, forming the so-called "barren lands" of the north. With the exception of a strip of Silurian and Devonian rocks, 40 to 80 miles wide, and extending from the vicinity of the Severn river to the Churchill, and several isolated areas of Cambrian and Huronian, the district is occupied by Laurentian rocks. The principal river is the Nelson, which, with its great tributary, the North Saskatchewan, is 1450 miles long; other tributaries are the Berens, English, Winnipeg, Red, Assiniboine, and South Saskatchewan. The Hayes, Severn, and Winisk also fall in from the south-west into Hudson Bay, and the Ekwan, Attawapiskat and Albany, 500 miles long, into James Bay. The Churchill, 925 miles, Thlewiaza, Maguse, and Ferguson rivers discharge into Hudson Bay on the west side; the Kazan, 500 miles, and Dubawnt, 660 miles, into Chesterfield Inlet; and Back's river, rising near Aylmer Lake, flows north-eastwards 560 miles to the Arctic Ocean. The principal lakes are St Joseph and Seul on the southern boundary; northern part of Lake Winnipeg, 710 feet above the sea; Island; South Indian; Etawney; Nuelltin; Yathkyed, at an altitude of 300 feet; Maguse; Kaminuriak; Baker, 30 feet; Aberdeen, 130 feet; and Garry. The principal islands are Southampton, with an area of 17,800 square miles; Marble Island, the usual wintering place for whaling vessels; and Bell and Coats Islands, in Hudson Bay; and Akimiski, in James Bay. A few small communities at the posts of the Hudson Bay Company constitute practically the whole of the white population. In 1897 there were 852 Indians in the Churchill and Nelson rivers district, but no figures are available for the district as a whole. The principal posts

in Keewatin are Norway House, near the outlet of Lake Winnipeg; Oxford House, on the lake of the same name; York Factory, at the mouth of Hayes river; and Forts Severn and Churchill, at the mouths of the Severn and Churchill rivers respectively. The lieutenant-governor of Manitoba is, *ex officio*, lieutenant-governor of Keewatin. (J. WH*.)

Kehl, a river port of Germany, grand duchy of Baden, standing on the Rhine, opposite to Strasburg, and 30 miles by rail south-west of the town of Baden. Here was opened in 1900 a harbour, 11,480 feet long, and 330 feet wide, with an easy entrance. It is protected from the Rhine by a dyke 26 feet high (above Rhine low water), and cost some £425,000. A second basin is to be added. Population (1900), 3003.

Kei Islands, a group in the Malay Archipelago, belonging to the residency of Amboyna, lying between 5° and 6° 5' S. and 131° 50' and 133° 15' E., and consisting of four parts: Nuhu-Iut or Great Kei, Roa or Little Kei, the Tayanda, and the Kur group. Great Kei differs geologically in every respect from the other groups. It is of Tertiary formation (Miocene), and its mountain-chain of stone, running in the direction of its longitudinal axis, has peaks such as Boo, Daap, &c., reaching a height of 2600 feet. All the other groups are of post-Tertiary formation and of level surface, hardly relieved by any heights. According to Professor Martin, the frontier of the islands, detached as they are from the Asiatic continent on the one hand and the Australian continent on the other, runs between (a) Great Kei and the north-west of Timor and (b) the western isles of the Kei group. Among the products of the islands are copra, maize, yams, and tobacco. Planten estimates the population at about 23,000, of whom 14,900 are pagans, 8300 Mahomedans, and about 22 Christians. Area, 572 square miles.

See KAN, "Onze geografische kennis der Keij-Eilanden," in *Tijdschr. Aardr. Gen.*, 1887.—MARTIN, "Die Kei-inseln u. ihr Verhältniss zur Australisch-Asiatischen Grenzlinie," in *ibid.*, part vii., 1890.—VAN HOËVELL, "De Kei-Eilanden," in *Tijdschr. Bat. Gen.*, 1889; "Verslagen van de wetenschappelijke opnemingen en onderzoekingen op de Keij-Eilanden," 1889-90, by Planten and Wertheim, 1893, with map and ethnographical atlas of the south-western and south-eastern islands by Pleyte.

Keighley, a municipal borough (incorporated 1882, extended 1895) in the Keighley parliamentary division of Yorkshire, England, on the Aire, 9 miles north-west of Bradford by rail. By the Leeds and Liverpool canal the town is connected with Hull and Liverpool. A grammar-school was founded in 1713, the operations of which have been extended so as to embrace a trade school (1871) for boys and a grammar-school for girls. The Public Libraries Acts have been adopted. There are a hospital and considerable charities, and also three public pleasure-grounds. The principal industries are manufactures of woollen goods, spinning, sewing, and washing machines, and tools. Population (1891), 35,012; (1901), 41,565.

Keith, a police burgh and important railway junction of Banffshire, Scotland, on the river Isla, 53½ miles north-west of Aberdeen. There are a public hall, a hospital, and an institute and museum. Keith is the centre of the agricultural trade of Banffshire; there are manure and lime works, and tweed and blanket factories; an extensive dead meat trade is conducted. The public school has a secondary department. Population (1881), 4339; (1901), 4753.

Kekulé, Friedrich August (1829-1896), German chemist, was born at Darmstadt on 7th September 1829. He was intended to adopt the profession of an architect, and it was while he was studying at Giessen, in

furtherance of that design, that he came under the influence of Liebig and was induced to take up chemistry. From Giessen he went to Paris, where he attended lectures by Regnault, Fremy, and Wurtz, and contracted a friendship with Gerhardt; then, after a short sojourn in Switzerland, he visited England, and became acquainted with the doctrines of Williamson and Odling. He thus enjoyed the advantage of personal intercourse with several of the leading chemical thinkers of the period. On his return to Germany he started a small chemical laboratory at Heidelberg, where, with a very slender equipment, he carried out several important researches. In 1858 he was appointed professor of chemistry at Ghent, and in 1865 was called to Bonn to fill a similar position, which he held till his death on 13th June 1896. Kekulé's main importance lies in the far-reaching contributions which he made to chemical theory, especially in regard to the constitution of the carbon compounds. The doctrine of atomicity had already been enunciated by Frankland, when in 1858 Kekulé published a paper in which, after giving reasons for regarding carbon as a tetravalent element, he set forth the essential features of his famous doctrine of the linking of atoms. He explained that in substances containing several carbon atoms it must be assumed that some of the affinities of each carbon atom are bound by the affinities of the atoms of other elements contained in the substance, and some by an equal number of the affinities of the other carbon atoms. The simplest case is when two carbon atoms are combined so that one affinity of the one is tied to one affinity of the other; two, therefore, of the affinities of the two atoms are occupied in keeping the two atoms together, and only the remaining six are available for atoms of other elements. The next simplest case consists in the mutual interchange of two affinity units, and so on. This conception led Kekulé to his "closed chain" or "ring" theory of the constitution of benzene (see CHEMISTRY in vol. xxvi.), which has been called the "most brilliant piece of prediction to be found in the whole range of organic chemistry," and this in turn led in particular to the elucidation of the constitution of the "aromatic compounds," and in general to new methods of chemical synthesis and decomposition, and to a deeper insight into the composition of numberless organic bodies and their mutual relations. Professor F. R. Japp, indeed, went so far as to say, in the Kekulé memorial lecture he delivered before the London Chemical Society on 15th December 1897, that three-fourths of modern organic chemistry is directly or indirectly the product of Kekulé's benzene theory, and that without its guidance and inspiration the industries of the coal-tar colours and the artificial therapeutic agents in their present form and extension would have been inconceivable.

(H. M. R.)

Keller, Gottfried (1819-1890), German novelist, was born at Zürich, 19th July 1819. His father, a master joiner, dying while Gottfried was young, his education was imperfect, and he wasted much time in trying to learn to paint. At length interest in politics threw him into literature—his talents, first disclosed by some short poems, obtaining recognition from the government of his native canton, and he was enabled to go through a regular course of study at the University of Heidelberg. From 1850 to 1855 he lived at Berlin, where he wrote his most important novel, *Der Grüne Heinrich* (23rd ed. 1901), remarkable for its delicate autobiographic portraiture and the beautiful episodes interwoven with the action, and *Die Leute von Seldwyla* (27th ed. 1901), studies of Zürich life, including in *Romeo und Julia aus dem Dorfe* the most powerful story of real life ever written in German, and in *Die drei gerechten Kammacher*, almost as great a master-

piece in the department of humour. Returning to his native city with a considerable reputation, he received the appointment of public secretary. For a time his creative faculty seemed paralysed by his public duties, but in 1872 appeared *Sieben Legenden*, and in 1874 a second series of *Die Leute von Seldwyla*, in both which books, if no longer visited by such happy inspirations as in his youth, he displayed no abatement of power and originality. He retired from the public service in 1876, and employed his leisure in the production of *Züricher Novellen* (1878), *Das Sinngedicht*, a charming novel (1881) and *Martin Salander* (21st ed. 1901), a criticism on Swiss institutions in the form of a fiction (1886). He died on 15th July 1890. Keller's place among German novelists is very high, and his genius is entirely original. Few have united such fancy and imagination to such uncompromising realism, or such tragic earnestness to such abounding humour. The serious didactic purpose of his novels is so far from being obtruded that, except in the last, it is hardly perceived. His *Gesammelte Werke* were published in eleven volumes in 1889-1901.

See BÄCHTOLD, *Kellers Leben, seine Briefe und Tagebücher* (Berlin, 1893-95), and Gottfried Keller, *a Selection of his Tales*, translated by Kate Freiligrath Kroeker (London, 1891). (R. G.)

Kelso, a burgh of barony and police burgh of Roxburghshire, Scotland, on the river Tweed at its junction with the Teviot, 23 miles west-south-west of Berwick-on-Tweed by road. The distinctive local industry now is the making of fishing tackle of all kinds, for which Kelso firms are widely famed. There is a high school. Population (1881), 4701; (1901), 4006.

Kelvin, William Thomson, 1st Baron (1824—), British physicist, the second son of James Thomson, LL.D., professor of mathematics in the University of Glasgow, was born at Belfast, Ireland, 26th June 1824, his father being then teacher of mathematics in the Royal Academical Institution. In 1832 James Thomson accepted the chair of mathematics at Glasgow, and migrated thither with his two sons, James and William, who in 1834 matriculated in that university, William being then little more than ten years of age, and having acquired all his early education through his father's instruction. In 1841 William Thomson entered Peterhouse, Cambridge, and in 1845 took his degree as second wrangler, to which honour he added that of the first Smith's Prize. The senior wrangler in his year was Stephen Parkinson, a man of a very different type of mind, yet one who was a prominent figure in Cambridge for many years. In the same year Thomson was elected Fellow of Peterhouse. At that time there were few facilities for the study of experimental science in Great Britain. At the Royal Institution Faraday held a unique position, and was feeling his way almost alone. In Cambridge science had progressed little since the days of Newton. Thomson therefore had recourse to Paris, and for a year worked in the laboratory of Regnault, who was then engaged in his classical researches on the thermal properties of steam; but his stay in Paris was comparatively short, for in 1846, when only twenty-two years of age, he accepted the Chair of Natural Philosophy in the University of Glasgow, which he filled for fifty-three years, attaining universal recognition as one of the greatest physicists of his time. The Glasgow chair was a source of inspiration to scientific men for more than half a century, and many of the most advanced researches of other physicists grew out of the suggestions which Thomson scattered as sparks from his anvil. One of his earliest papers dealt with the age of the earth, and brought him into collision with the geologists of the Uniformitarian school, who were claiming thousands of mil-

ions of years for the formation of the stratified portions of the earth's crust. Thomson's calculations on the conduction of heat showed that at some time between twenty millions and four hundred millions, probably about one hundred millions, of years ago, the physical conditions of the earth must have been entirely different from those which now obtain. This led to a long controversy, in which the physical principles held their ground. In 1847 Thomson first met James Prescott Joule at the Oxford meeting of the British Association. A fortnight later they again met in Switzerland, and together measured the rise of temperature of the water in a mountain torrent due to its fall. Joule's views of the nature of heat strongly influenced Thomson's mind, with the result that in 1848 Thomson proposed his absolute scale of temperature, which is independent of the properties of any particular thermometric substance (see THERMODYNAMICS, *Ency. Brit.* vol. xxiii. p. 285), and in 1851 he presented to the Royal Society of Edinburgh a paper on the Dynamical Theory of Heat, which reconciled the work of Carnot with the conclusions of Rumford, Davy, Mayer, and Joule, and placed the Dynamical Theory of Heat and the fundamental principle of the Conservation of Energy in a position to command universal acceptance. It was in this paper that the principle of the Dissipation of Energy, briefly summarized in the second law of thermodynamics, was first stated (*ibid.* xxii. 479; xxiii. 285). In 1850 Thomson experimentally verified the theoretical conclusion of his brother James that, since water expands on freezing, increase of pressure must lower the freezing point (*ibid.* xii. 612). Applying his principles of energy to thermo-electric currents, Thomson showed that in an unequally heated conductor of the same metal a current of electricity must generally affect the distribution of temperature ("Thomson effect," *ibid.* viii. 97).

Although his contributions to Thermodynamics may properly be regarded as his most important scientific work, it is in the field of electricity, especially in its application to submarine telegraphy, that Lord Kelvin is best known to the world at large. From 1854 he is most prominent among telegraphists. The stranded form of conductor was due to his suggestion (*ibid.* xxiii. 114); but it was in the letters which he addressed in November and December of that year to Professor Stokes, and which were published in the *Proceedings of the Royal Society* for 1855, that he discussed the mathematical theory of signalling through submarine cables, and enunciated the conclusion that in long cables the retardation due to capacity must render the speed of signalling inversely proportional to the square of the cable's length (*ibid.* xxiii. 115, 125). Some held that if this were true ocean telegraphy would be impossible, and sought in consequence to disprove Thomson's conclusion. Thomson, on the other hand, set to work to overcome the difficulty by improvement in the manufacture of cables, and first of all in the production of copper of high conductivity and the construction of apparatus which would readily respond to the slightest variation of the current in the cable. The mirror galvanometer (*ibid.* x. 49, sq.) and the siphon recorder, which was patented in 1867 (*ibid.* xxiii. 124, 125), were the outcome of these researches; but the scientific value of the mirror galvanometer is independent of its use in telegraphy, and the siphon recorder is the direct precursor of one form of galvanometer (d'Arsonval's) now commonly used in electrical laboratories. A mind like that of Thomson could not be content to deal with any physical quantity, however successfully from a practical point of view, without subjecting it to measurement. Thomson's work in connexion with telegraphy led to the production in rapid succession of instruments adapted to the requirements of the time for the measurement of every

electrical quantity, and when electric lighting came to the front a new set of instruments was produced to meet the needs of the electrical engineer. Some account of Thomson's electrometer is given in the earlier volumes of this work (viii. 119-121), while every modern work of importance on electric lighting describes the instruments which he has specially designed for central station work; and it may be said that there is no quantity which the electrical engineer is ordinarily called upon to measure for which Lord Kelvin has not constructed the suitable instrument. Currents from the ten-thousandth of an ampere to ten thousand amperes, electrical pressures from a minute fraction of a volt to 100,000 volts, come within the range of his instruments, while the private consumer of electric energy is provided with a meter recording Board of Trade units.

When Weber in 1851 proposed the extension of Gauss's system of absolute units to electromagnetism, Thomson took up the question, and, applying the principles of energy, calculated the absolute electromotive force of a Daniell cell, and determined the absolute measure of the resistance of a wire from the heat produced in it by a known current. In 1861 it was Thomson who induced the British Association to appoint its first famous committee for the determination of electrical standards, and it was he who suggested much of the work carried out by Clerk Maxwell, Balfour Stewart, and Fleeming Jenkin as members of that committee (*ibid.* viii. 44, 45, and 104). The oscillatory character of the discharge of the Leyden jar, the foundation of the work of Hertz and of wireless telegraphy, were investigated by him in 1853.

It was in 1873 that he undertook to write a series of articles for *Good Words* on the mariner's compass. He wrote the first, but so many questions arose in his mind that it was five years before the second appeared. In the meanwhile the compass went through a process of complete reconstruction in his hands, a process which enabled both the permanent and the temporary magnetism of the ship to be readily compensated, while the weight of the 10-inch card was reduced to one-seventeenth of that of the standard card previously in use, although the time of swing was increased (*ibid.* vi. 228). Second only to the compass in its value to the sailor is Thomson's sounding apparatus, whereby soundings can be taken in 100 fathoms by a ship steaming at 16 knots; and by the employment of piano-wire of a breaking strength of 1.40 tons per square inch and an iron sinker weighing only 34 lb, with a self-registering pressure gauge, soundings can be rapidly taken in deep ocean (*ibid.* xxii. 281). Thomson's tide gauge, tidal harmonic analyser, and tide predictor are briefly described in the earlier volumes of this work (xxiii. 371), and among his work in the interest of navigation must be mentioned his tables for the simplifica-

tion of Sumner's method for determining the position of a ship at sea.

It is impossible within brief limits to convey more than a general idea of the work of a philosopher who has published more than three hundred original papers bearing upon nearly every branch of physical science; who one day is working out the mathematics of a vortex theory of matter on hydrodynamical principles or discovering the limitations of the capabilities of the vortex atom, on another is applying his knowledge of elasticity to tides in the solid earth, or calculating the size of water molecules, and later is designing an electricity meter, a dynamo, or a domestic water-tap. It is only by reference to his published papers that any approximate conception

can be formed of his life's work; but the student who has read all these knows comparatively little of Lord Kelvin if he has not talked with him face to face. Extreme modesty, almost amounting to diffidence, is combined with the utmost kindness in Lord Kelvin's bearing to the most elementary student, and nothing seems to give him so much pleasure as an opportunity to acknowledge the efforts of the humblest scientific worker. The progress of physical discovery during the last half of the 19th century was perhaps as much due to the kindly encouragement which he gave to his students and to others who came in contact with him as to his own researches and inventions; and it would be difficult to speak of his influence as a teacher in stronger terms than this.

One of his former pupils, Professor J. D. Cormack, writes: "It is perhaps at the lecture table that Lord Kelvin displays most of his characteristics. . . His master mind, soaring high, sees one vast connected whole, and,

alive with enthusiasm, with smiling face and sparkling eye, he shows the panorama to his pupils, pointing out the similarities and differences of its parts, the boundaries of our knowledge, and the regions of doubt and speculation. To follow him in his flights is real mental exhilaration."

In 1852 Thomson married Margaret, daughter of Walter Crum of Thornliebank, who died in 1870; and in 1874 he married Frances Anna, daughter of Charles R. Blandy of Madeira. In 1866, perhaps chiefly in acknowledgment of his services to transatlantic telegraphy, Thomson received the honour of knighthood, and in 1892 he was raised to the peerage with the title of Baron Kelvin of Largs. The Grand Cross of the Royal Victorian Order was conferred on him in 1896, the year of the jubilee of his professoriate. In 1890 he became President of the Royal Society. A list of the degrees and other honours which he received during the fifty-three years he held his Glasgow chair would occupy as much space as this article; but any biographical sketch would be conspicuously incomplete if it failed to notice the celebration in 1896 of the jubilee of his pro-

LORD KELVIN.

(From a photograph by Elliott and Fry, London.)

fessorship. Never before had such a gathering of rank and science assembled as that which filled the halls of the University of Glasgow on 15th, 16th, and 17th of June in that year. The city authorities joined with the university in honouring their most distinguished citizen. About 2500 guests were received in the University buildings, the library of which was devoted to an exhibition of the instruments invented by Lord Kelvin, together with his certificates, diplomas, and medals. The Eastern, the Anglo-American, and the Commercial Cable Companies united to celebrate the event, and from the University Library a message was sent through Newfoundland, New York, Chicago, San Francisco, Los Angeles, New Orleans, Florida, and Washington, and was received by Lord Kelvin seven and a half minutes after it had been despatched, having travelled about 20,000 miles and twice crossed the Atlantic during the interval. It was at the banquet in connexion with the jubilee celebration that the Lord Provost of Glasgow thus summarized Lord Kelvin's character: "His industry is unwearied; and he seems to take rest by turning from one difficulty to another—difficulties that would appal most men and be taken as enjoyment by no one else. . . . This life of unwearied industry, of universal honour, has left Lord Kelvin with a lovable nature that charms all with whom he comes in contact."

Kemble, Frances Anne (1809–1893), English actress and writer, daughter of the actor Charles Kemble (*Ency. Brit.* xiv. 30), was born in London 27th November 1809, and educated chiefly in France. She first appeared on the stage in 1829 as Juliet at Covent Garden. Her attractive personality at once made her a great favourite, her popularity enabling her father to recoup his losses as a manager. Besides playing all the principal women's parts—Julia in *The Hunchback* being perhaps her best—she brought out a play of her own in 1832, entitled *Francis the First*, a piece of no particular merit. In 1833 she went on tour with her father in America, and in 1834 married a Southern planter, Mr Pierce Butler. She was so horrified, however, at the slavery in Georgia, that she eventually refused to live with her husband on his estates, and they separated. She devoted herself largely to literary work. In 1835 she published a volume of her *Journal*, in 1837 another play, *The Star of Seville*, and in 1844, *Poems*. She also returned to the stage, and, following her father's example, had some success as a Shakespearian reader. She travelled in Italy, and in 1847 brought out a book on the subject, *A Year of Consolation*. In 1856 she published *Christmas Tales* (from the German), and in 1863 another volume of her *Journal* (dealing with life on the Georgia plantation), and also a volume of *Plays*, including translations from Dumas and Schiller. In 1877 she returned to England, where she lived—using her maiden name—till her death in London on 15th January 1893. During this later period Fannie Kemble was a prominent and popular figure in the social life of London. She published *Records of a Girlhood* (1878), *Records of Later Life* (1882), *Notes on some of Shakespeare's Plays* (1882), *Far Away and Long Ago* (1889), and *Further Records* (1891). Her various volumes of reminiscences contain much valuable material for the social and dramatic history of the period. (H. CH.)

Kempton, a town of Bavaria, Germany, district of Swabia, 81 miles by rail south-west of Munich, and on the river Iller. The palace of the former abbot princes (1656–74) is now partly used as barracks, and the town hall, in the old town, has been restored. Numerous Roman remains were discovered near here in 1886. There are an agricultural and a technical school. Cotton spinning

and weaving, brewing, and manufactures of paper, wood-pulp, hosiery, machinery, and matches are carried on. Population (1885), 14,368; (1900), 18,857.

Kendal, a parish, municipal borough, and market town in the Kendal parliamentary division of Westmorland, England, 8 miles from Windermere on the Kendal and Windermere branch of the London and North-Western railway. Recent erections embrace a town hall, market house, new buildings for the grammar school, electric lighting and power station, and many villas and terraces of houses. There are a fine old parish church, Roman Catholic, Wesleyan, and other chapels, public library, baths, and pleasure-grounds. Area, 2622 acres. Population (1891), 14,430; (1901), 14,183.

Kendall, Henry Clarence (1841–1882), Australian poet, son of a missionary, was born in New South Wales, 18th April 1841, and, as a young man, entered a lawyer's office in Sydney. He had always had literary tastes, and sent some of his own verses in 1862 to London to be published in the *Athenæum*. Next year he obtained a clerkship in the Lands Department at Sydney, being afterwards transferred to the Colonial Secretary's office; and he combined this work with the writing of poetry and journalism. His principal volumes of verse were *Leaves from an Australian Forest* (1869) and *Songs from the Mountains* (1880), his feeling for nature, as embodied in Australian landscape and bush-life, being very true and full of charm. In 1869 he resigned his post in the public service, and for some little while he was in business with his brothers. Sir Henry Parkes took an interest in him, and eventually appointed him to an inspectorship of forests. He died on 1st August 1882. In 1886 a memorial edition of his poems was published at Melbourne.

Kenealy, Edward Vaughan Hyde (1819–1880), Irish barrister and author, was born at Cork, 2nd July 1819, being the son of a local merchant. He was educated at Trinity College, Dublin, and was called to the Irish bar in 1840 and to the English bar in 1847, and obtained a fair practice in criminal cases. In 1868 he became a Q.C. and a bencher of Gray's Inn. It was not, however, till 1873, when he became leading counsel for the Tichborne claimant, that he came into any great prominence. He behaved so violently that his conduct in the case became a public scandal, and after the verdict against his client he started a paper to plead his cause and to attack the judges. His behaviour was so extreme that in 1874 he was disbenched and disbarred by his Inn. He then started an agitation throughout the country to ventilate his grievances, and succeeded in 1875 in getting elected to parliament for Stoke; but no member would introduce him when he took his seat. Dr Kenealy (as he was always known) gradually ceased to attract attention, and on 16th April 1880 he died in London. He published a voluminous amount of verse, and also of somewhat mystical theology, but his title to remembrance rests solely on his connexion with the Tichborne case.

Kēng Tūng, the most extensive of the Shan States in the province of Burma. It is in the southern Shan States, and lies almost entirely east of the Salween river. The area of the state is rather over 12,000 square miles. On the N. it is bounded by the states of Mang Lön, Mōng Lem, and Kēng Hūng (Hsip Hsawng Pannā), the two latter under Chinese control. On the E. it is bounded by the Mēkhong river, on the farther side of which is French Lao territory; on the S. by the Siamese Shan States, and on the W. in a general way by the Salween river, though it overlaps it in some places.

The state is known to the Chinese as Mêng Kêng, and was frequently called by the Burmese "the 32 cities of the Gôn" (Hkôn). Kêng Tūng has expanded very considerably, since the establishment of British control, by the inclusion of the districts of Hsen Yawt, Hsen Mawng, Mông Hsat, Mông Pu, and the cis-Mèkhong portions of Kêng Cheng, which in Burmese times were separate charges. The "classical" name of the state is Khemarata or Khemarata Tungkapuri. About 63 per cent. of the total area of the state lies in the basin of the Mèkhong river and 37 per cent. in the Salween drainage area. The watershed is a high and generally continuous range. Some of its peaks rise to over 7000 feet, and the elevation is nowhere much below 5000 feet. Parallel to this successive hill ranges run north and south. Mountainous country so greatly predominates that the scattered valleys are but as islands in a sea of rugged hills. The chief rivers, tributaries of the Salween, are the Nam Hka, the Hwe Lông, Nam Pu, and the Nam Hsím. The first and last are very considerable rivers. The Nam Hka rises in the Wa or Vü states, the Nam Hsím on the watershed range in the centre of the state. Rocks and rapids make both unnavigable, but much timber goes down the Nam Hsím. The lower part of both rivers forms the boundary of Kêng Tūng state. The chief tributaries of the Mèkhong are the Nam Nga, the Nam Lwe, the Nam Yawng, Nam Lín, Nam Hók, and Nam Kók. Of these the chief is the Nam Lwe, which is navigable in the interior of the state, but enters the Mèkhong by a gorge broken up by rocks. The Nam Lín and the Nam Kók are also considerable streams. The lower course of the latter passes by Chieng Rai in Siamese territory. The lower Nam Hók or Mē Huak forms the boundary with Siam.

The existence of minerals was reported by the Sawbwa, or chief, to Francis Garnier in 1867, but none are worked or located. Gold is washed in most of the streams. Teak forests exist in Mông Pu and Mông Hsat, and the Sawbwa works them as Government contracts. One-third of the price realized from the sale of the logs at Moulmein is retained as the Government royalty. There are teak forests also in the Mèkhong drainage area in the south of the state, but there is only a local market for the timber. Rice, as elsewhere in the Shan States, is the chief crop. Next to it is sugarcane, which is grown both as a field crop and in gardens. Earthnuts and tobacco are the only other field crops in the valleys. On the hills, besides rice, cotton, poppy, and tea are the chief crops. The cotton goes to China, except what is locally used, and so does the surplus opium, which was formerly chiefly sold in the Upper Lao country, now French territory and a closed market. The tea is carelessly grown, badly prepared, and only consumed locally. A great deal of garden produce is raised in the valleys, especially near the capital. The state is rich in cattle, and exports them to the country west of the Salween. There is no means of estimating the volume of trade. Cotton and opium are exported in large quantities, the former entirely to China, a good deal of the latter to northern Siam, which also takes shoes and sandals. Tea is carried through westwards from Kêng Hüng, and silk from the Siamese Shan States. Cotton and silk weaving are dying out as industries. Large quantities of shoes and sandals are made of buffalo and bullock hide, with Chinese felt uppers and soft hobnails. There is a good deal of pottery work, and the chief work in iron is the manufacture of guns, which has been carried on for many years in certain villages of the Sam Tao district. The gun barrels and springs are rude but effective, though not very durable. The revenue of the state is collected as the Burmese *thathameda*, a rude system of income-tax. From 1890, when the state made its submission, the annual tributary offerings made in Burmese times were continued to the British Government.

Nothing but the roughest enumeration has ever been made of the population. The following estimate was made by Mr Stirling, the political officer in charge of the state, in 1897-98:—Inhabitants of the valleys, Shans or Shan-Chinese, 116,000; inhabitants of the hills, 56,560, giving a total population of 172,560. This is based on a rough enumeration of households. Of the various tribes of Shans, the Hkôn and Lü contribute about 36,000 each, the western Shans 32,000, the Lem and Lao Shans about 7000, and the Chinese Shans about 5000. Of the hill tribes, the Kaw or Akha are the most homogeneous with 22,000, but probably the Wa (or Vü), disguised under various gratuitously tribal names, are at least

equally numerous. Nominal Buddhists make up a total of 133,400, and the remainder, 39,160, are admitted followers of animistic religion. Spirit worship is, however, very conspicuously prevalent amongst all classes even of the Shans. The present Sawbwa or chief received his patent from the British Government on the 9th February 1897. The early history of Kêng Tūng is very obscure, but Burmese influence seems to have been maintained since the latter half, at any rate, of the 16th century. The Chinese made several attempts to subdue the state, and appear to have taken the capital in 1765-66, but were driven out by the united Shan and Burmese troops. The same fate seems to have attended the first Siamese invasion of 1804. The second and third Siamese invasions, in 1852 and 1854, resulted in great disaster to the invaders, though the capital was invested for a time.

KENG TŪNG, the capital, is situated towards the southern end of a valley about 12 miles long and with an average breadth of 7 miles. The town is surrounded by a brick wall and moat about 5 miles round. Only the central and northern portions are much built over. The population in 1897 was estimated at about 10,000, with 2500 Shan Chinese in a village immediately outside the walls. It is the most considerable town in the British Shan States. In the dry season crowds attend the market held according to Shan custom every five days, and numerous caravans come from China. The assistant political officer has a guard of fifty sepoy, with a British and native officer. The military post is 7 miles west of the town, at the foot of the watershed range. At first the headquarters of a regiment was stationed there; this was reduced to a wing, and it is contemplated to hold the station with military police. The site was badly chosen, and has proved very unhealthy. The rainfall has not been regularly taken, but probably averages between 50 and 60 inches for the year. The temperature seems to rise to nearly 100° Fahr. during the hot weather, falling 30° or more during the night. In the cold weather a temperature of 40° or a few degrees more or less appears to be the lowest experienced. (J. G. Sc.)

Kennedy, Benjamin Hall (1804-1889), English scholar and schoolmaster, was born at Summer Hill, near Birmingham, 6th November 1804. He was educated at King Edward's School, Birmingham, and St John's College, Cambridge. At the university he carried off one classical prize after another, until, having graduated as senior classic, he was elected Fellow and Classical Lecturer of St John's College in 1828. Two years later he became an assistant master at Harrow, from where he went to Shrewsbury School as headmaster in 1836. By this time he had been ordained, and had received the degree of D.D. from his university. In 1831 he married Miss Janet Caird. He retained the headmastership of Shrewsbury until 1866, the thirty years of his rule there being marked by a long series of successes won by his pupils, chiefly in the field of classics. During that period he held (from 1841) a prebend at Lichfield and (from 1865 to 1868) the incumbency of West Felton, Salop. When he retired from Shrewsbury, a large sum was collected as a testimonial to him, and was devoted partly to the new school buildings and partly to the founding of a Latin professorship at Cambridge. It is cited as characteristic of him that he added £500 to the fund on the special condition that his name should not appear in the designation by which the new professorship was to be known. In 1867 he was elected Regius Professor of Greek at Cambridge and Canon of Ely; in 1870, member of the Council of the University; in 1880, Hon. Fellow, and in 1885, Ordinary Fellow of St John's College. From 1870 to 1880 he was a member of the Committee for the Revision of the New Testament. He was an enthusiastic advocate for the admission of women to a university education, and took a prominent part in the establishment of Newnham and Girton colleges. He was also a keen politician. Among a number of classical school-books published by him are two, a *Public School Latin Primer* and *Public School Latin Grammar*, which were for long in almost universal use. The former was produced, in accordance with the recommendation of a Royal Commission upon the chief public schools, by a committee of headmasters (of whom he was one), and was based upon

an *Elementary Latin Grammar* previously written by him. He published a masterly edition of Sophocles's *Oedipus Tyrannus* with poetic translation, and performed the same office for Aristophanes's *Birds*, Æschylus's *Agamemnon*, and Plato's *Thecætetus*. He contributed largely to the collection known as *Sabrinæ Corolla*, and published a collection of verse in Greek, Latin, and English under the title of *Between Whiles*. He died at Torquay, on 6th April 1889. (R. F. S.)

Kenosha, capital of Kenosha county, Wisconsin, U.S.A., on the western shore of Lake Michigan, at an altitude of 611 feet. It is traversed by the Chicago and North-Western railroad. The site of the city is broad and level and its plan fairly regular. It has some lake commerce, and its manufactures include furniture, wagons, and carriages. Population (1880), 5039; (1900), 11,606, of whom 3333 were foreign-born.

Kent, a maritime county in the south-eastern corner of England. The area of the ancient county, as given in the census returns, is 995,344 acres, or 1555 square miles, with a population in 1881 of 977,706, and in 1891 of 1,142,324, of whom 555,718 were males and 586,606 females, the number of persons per square mile being 735, and of acres to a person, 0.87. The population of the ancient county in 1901 was 1,351,849. The area of the administrative county, exclusive of the county borough of Canterbury, is 971,849 acres, with a population of 785,674; and including the county borough its area is 975,820 acres, with a population in 1891 of 807,328, and in 1901 of 936,003. Under the provisions of the Local Government Act, 1888, 20,060 acres of the ancient county were transferred to the county of London, and 536 acres, part of Tunbridge Wells urban sanitary district in the ancient county of Sussex, were added in October 1890. The area of the registration county is 968,879 acres, with a population in 1891 of 806,297, of which 508,647 were urban and 297,650 rural. Within this area the increase of population between 1881 and 1891 was 13.68 per cent. The excess of births over deaths between 1881 and 1891 was 105,557.

The following table gives the number of marriages, births, and deaths, and the number of illegitimate births, in 1880, 1890, and 1899:—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
				Males.	Females.
1880	4794	22,569	12,447	463	438
1890	5242	22,096	12,861	485	441
1899	7029	23,566	14,876	465	464

The following table shows the marriage-, birth-, and death-rates per thousand of the population, with the percentage of illegitimate births, for a series of years:—

	1870-79.	1880.	1880-89.	1890.	1889-98.	1899.
Marriage-rate	14.0	13.6	13.4	13.1	13.7	15.8
Birth-rate	32.7	30.6	31.1	27.7	27.1	26.4
Death-rate	18.4	17.7	16.8	16.1	15.6	16.7
Percentage of illegitimacy	4.6	4.0	4.3	4.2	4.0	3.9

The birth-rate and death-rate are below the average for England. The number of Scots in the county in 1891 was 6395, of Irish 8155, and of foreigners 3727.

Administration.—The ancient county is divided into eight parliamentary divisions, and it also includes the parliamentary boroughs of Canterbury, Chatham, Dover, Gravesend, Hythe, Maidstone, and Rochester. The administrative county includes seventeen municipal boroughs, exclusive of the county borough of Canterbury (24,868), viz., Chatham (40,753), Deal (10,575), Dover (41,782), Faversham (11,290), Folkestone (30,694), Gravesend (27,175), Hythe (5557), Lydd (2615), Maidstone (33,516), Margate (23,067), New Romney (1327), Queenborough (1546), Ramsgate (27,693), Rochester (60,622), Sandwich (3174), Tenterden (3243),

Tunbridge Wells (33,388). The administrative county has one court of quarter sessions and fifteen petty sessional divisions. The non-corporate members of the Cinque Ports of Dover and Sandwich and the municipal boroughs of Canterbury, Deal, Dover, Faversham, Folkestone, Gravesend, Hythe, Maidstone, Margate, Rochester, Sandwich, and Tenterden have each separate commissions of the peace and separate courts of quarter sessions, and the boroughs of Lydd and New Romney have separate commissions of the peace only. The central criminal court has jurisdiction over certain parishes adjacent to London. All those civil parishes within the county of Kent of which any part is within twelve miles of, or of which no part is more than fifteen miles from Charing Cross, are within the metropolitan police district. Kent is in the south-eastern or home circuit, and Maidstone is the assize town for the county, but assizes are also held at Canterbury for the city. The administrative county contains 389 entire civil parishes and parts of 14 others, and the county borough of Canterbury, 24 entire civil parishes and parts of 10 others. The ancient county contains, in addition to those parishes now in the county of London, 465 entire ecclesiastical parishes and parts of 5 others situate in the dioceses of Canterbury, Rochester, and Chichester.

Education.—The number of elementary schools in the county on 31st August 1899 was 570, of which 112 were board and 458 were voluntary schools, the latter including 403 national Church of England schools, 11 Wesleyan, 19 Roman Catholic, and 25 "British and others." The average attendance at board schools was 32,094, and at voluntary schools 86,965. The total school board receipts for the year ended 29th September 1898 were over £134,322. The income under the Agricultural Rates Act was over £2788. Dairy schools have been established by the technical education committee of the Kent county council. Lectures on hop-growing, horticulture, fruit culture, bees (extensively kept in Kent), and poultry rearing have also been established throughout the county. The South-Eastern Agricultural College, Wye, is under the control of the county councils of Kent and Surrey. In 1899 there were six reformatory and industrial schools in the county.

Agriculture.—About five-sixths of the area of the county are under cultivation, and of this about five-ninths are in permanent pasture. In the thirty years from 1868 to 1898 woodland had increased from 78,000 acres to 96,927 acres; 6591 acres are occupied by heathland used for grazing. Over 25,000 acres are devoted to orchards and over 22,000 acres to small fruit, and it is estimated that since 1868 the whole area of fruit land has more than doubled. At least 20,000 acres are devoted to the production of vegetables, salads, herbs, and flowers. Owing to the low prices obtained for hops in recent years the acreage has diminished from 38,606 acres in 1868 to 31,988 acres in 1899. The largest hop acreage in Kent was in 1885, when there were 44,834 acres.

The following table gives the main divisions of the cultivated area at intervals from 1880:—

Year.	Total Area under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	741,384	227,907	84,438	54,221	318,619	13,217
1890	760,780	200,365	77,303	54,139	368,474	11,639
1899	748,157	153,203	70,858	52,949	408,674	7,964

The following table gives particulars regarding the principal live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or in Calf.	Sheep.	Pigs.
1880	29,120	76,776	23,321	968,258	56,006
1890	28,150	75,550	32,150	916,214	66,659
1899	27,850	78,572	34,267	942,645	63,133

Industries and Trade.—According to the annual report for 1898 of the chief inspector of factories (1900), the total number of persons employed in factories and workshops in 1897 was 47,089, as compared with 44,677 in 1896. Textile factories employed only 225. In non-textile factories 39,790 persons were employed, as compared with 38,200 in 1896, of which number 16,349 persons were employed in the manufacture of machines, appliances, conveyances, and tools, 7194 in the clay and stone industry, and 6491 in paper-making, printing, &c. The number of persons employed in workshops in 1896 was 7074, of which number 3692 were employed in the clothing industry. The fisheries of Kent are of considerable importance, and are carried on chiefly at Deal, Dover, Folkestone, Margate, Ramsgate; Pegwell Bay, and Gravesend (shrimps), Queenborough, Rochester, Milton, Faversham, and Whitstable (oysters). The county is also famous for its shipbuilding and marine engine yards, iron foundries, breweries, tanneries, &c. The dockyards are

at Chatham and Sheerness, packet stations at Dover and Folkestone, and harbours at Ramsgate and Dover.

(H. B. W*.)

Kenton, capital of Hardin county, Ohio, U.S.A., on the Scioto river, at an altitude of 1015 feet, and on the Ohio Central lines and the Cleveland, Cincinnati, Chicago, and St Louis railroad. Population (1880), 3940; (1900), 6852, of whom 493 were foreign-born and 271 negroes.

Kentucky.—One of the central states of the United States of America. It has an area of 40,400 square miles, 400 square miles of which are estimated to be water surface, including the entire breadth of the Ohio river, over which it has jurisdiction, and half of the Mississippi river, leaving as the land area of the state 40,000 square miles.

Population.—The population of the state in 1880 was 1,648,690; in 1890, 1,858,635; and in 1900, 2,147,174, making it at the last date the twelfth state in the country in population. The rate of increase between 1890 and 1900 was 15.5 per cent., about one-fourth less than the average of the country. In 1900 the density of population was about 54 to the square mile; males were slightly in excess of females, the proportion being 50.8 per cent. males to 49.2 per cent. females. The foreign-born numbered but 50,249, or 2.3 per cent. of the whole population, and the number of negroes was 284,706, or 13.3 per cent. The proportion of negroes is steadily decreasing, owing to their migration to other states both north and south of Kentucky. The urban population in 1900, classing as such all persons in cities of more than 8000 inhabitants, was 16.9 per cent. of the total population, as compared with 14.9 ten years before. The principal cities, with their population in 1900, are: Louisville, at the falls of the Ohio, 204,731; Covington, 42,938; and Newport, 28,301, on the Ohio, opposite Cincinnati; Lexington, 26,369; Paducah, on the Ohio, at the mouth of the Tennessee, 19,446; Owensboro, 13,189; Henderson, 10,272; and Frankfort, the capital, 9487. Of the population over ten years of age in 1890, 21.6 per cent. were illiterate; this illiteracy was in great part confined to the negroes, 55.9 per cent. of whom were classed as illiterates, while only 15.8 per cent. of the whites came under this head. Out of 469,206 white males of voting age in 1900, 65,517 were unable to write; while out of 74,728 negro males of voting age, 36,990 were unable to write.

Agriculture and Mining.—Kentucky is still in the main an agricultural state, its chief industries and avocations relating to that branch. In 1890 there were 179,264 farms, comprising 21,412,229 acres, of which a little more than half, or 11,818,882 acres, 46 per cent. of the total area of the state, was improved. The average size of farm was 119 acres, or a little less than the average of the country. Three-fourths of all farms were owned by their occupants, the remainder being rented for money or a share of the products. The value of farms, implements, and live stock, or, in other words, the farm capital, exceeded \$428,000,000, and the value of products was nearly \$66,000,000. Tobacco is one of the chief products of the state. In 1896 there were devoted to its cultivation 196,745 acres, and the crop amounted to 143,623,850 lb, or 36 per cent. of the crop of the entire United States. In 1900, 12,442,846 bushels of wheat were produced, an amount larger than was needed for the supply of the population, leaving a surplus of at least 2,500,000 bushels for export. In the same year 390,064 tons of hay were pro-

duced, and 2,807,490 bushels of potatoes; there were 2,701,876 sheep, and the wool clip was 1,675,163 lb of scoured wool. The raising of hemp, which was once an important industry, has greatly diminished. The area of woodland is estimated at 22,200 square miles, or 55 per cent. of the area. The forests are mixed, but composed largely of deciduous trees, valuable for lumber. The chief mineral resources are coal and iron, and their development has progressed rapidly. In 1900, 4,113,620 tons of coal were mined, mainly in the eastern field, where large areas of superior coking coal are found. The amount of coal mined quadrupled between 1880 and 1900, giving Kentucky the tenth place among the states in this respect. The amount of pig-iron produced in 1900 was 71,562 tons.

Education, Charities, &c.—The public school system was maintained at a cost of \$2,650,190 in 1900. The number of pupils enrolled was 501,893, or about five-eighths of the number of persons (798,027) between five and twenty years of age inclusive. The average attendance was only three-fifths of the enrolment. The number of teachers employed was 9960, and schools were open for an average period of only 115 days in the year. There are thirteen colleges for men, including co-educational institutions, and eleven colleges for women. The number of students in all these institutions in 1899 was 5487. The statistics of church membership show that more than three-fifths of all church members are either Baptists or Methodists. Baptists constituted 37 per cent., Methodists 24 per cent., Roman Catholics 17 per cent., and Disciples of Christ 14 per cent. of all church members. Of charitable and penal institutions there are state prisons at Frankfort and Eddyville, asylums for the blind, deaf and dumb at Louisville and Danville, and insane asylums at Lexington, Hopkinsville, and Anchorage.

Manufactures.—The manufactures are largely comprised in the city of Louisville, where nearly one-half the manufacturing capital of the state is invested. In 1900 the state contained 9559 manufacturing establishments (including those having product of less than \$500 each), with a total capital of \$104,030,791; they employed 63,206 hands, to whom was paid in wages \$22,430,958; the products had a value of \$154,590,069. The leading products were manufactured tobacco, whisky, malt liquors, flour, foundry and machine-shop appliances, iron and steel, leather, lumber, carriages and waggons, furniture, agricultural implements, and packed meats.

Railways.—In 1900 the railway mileage was 3083 miles, which was mainly in the hands of the Louisville and Nashville, the Chesapeake and Ohio, and Queen and Crescent companies. These agencies of transportation are supplemented by the Ohio, Mississippi, Cumberland, Tennessee, and other navigable rivers, but altogether the means of intercommunication are not as yet well developed.

Finances.—The finances are in an excellent condition. In 1899 the receipts into the state treasury were \$5,013,010, and the expenditure was \$4,282,225. The amount of indebtedness was trifling, being less than the sinking fund. There were eighty-one national banks in the state, with a capital of \$12,000,000, and 225 state and private banks and trust companies, with a capital of \$17,000,000.

Political History.—Politically as well as geographically Kentucky is a border state, political parties being almost equally powerful, with perhaps a slight preponderance in favour of the Democratic party, which has commonly carried the elections. The election of 1900 was so close as to leave the governorship in doubt, and during the controversy which followed, Goebel, the Democratic candidate, was killed. The lieutenant-governor on the Democratic ticket was subsequently declared elected, and was installed as governor. A new constitution was adopted in 1899.

(H. G*.)

Kenya, a great volcanic mountain in East Africa, situated just south of the equator in 37° 20' E. It is one of the highest mountains of Africa, its highest peak reaching an altitude, according to careful triangulation by Captain Smith, R.E., of 17,184 feet. The central core, which consists of several steep pyramids, is that of a very denuded old volcano, which when its crater was complete may have reached a height of 2000 feet above the present summit. Lavas dip in all directions from the central crystalline core, pointing to the conclusion that the main portion of the mountain represents a single volcanic mass. From the central peaks, of which the axis runs from

W.N.W. to S.S.E., ridges radiate outwards, separated by broad valleys, ending upwards in vast cirques. The most important ridges centre in the peak Lenana (16,300 feet) at the eastern end of the central group, and through it runs the chief water-parting of the mountain, in a generally north to south direction. Three main valleys, known respectively as Hinde, Gorges, and Hoblely valleys, run down from this to the east, and four—Mackinder, Hausberg, Teleki, and Höhnel—to the west. From the central peaks a series of glaciers, 15 in number, all lying west of the main divide, descends to the north and south, the two largest being the Lewis and Gregory glaciers, each about a mile long, which, with the smaller Kolb glacier, lie immediately west of the main divide. Most of the glaciers terminate at an altitude of 14,800–14,900 feet, but the small César glacier, drained to the Hausberg valley, reaches to 14,450. There is clear evidence that glaciation was formerly much more extensive, old moraines being observed down to 12,000 feet. In the upper parts of the valleys a number of lakes occur, occupying hollows and rock basins in the agglomerates and ashes, fed by springs, and feeding many of the streams that drain the mountain slopes. The largest of these are Lake Höhnel, lying at an altitude of 14,000 feet, at the head of the valley of the same name, and measuring 600 yards by 400; and Lake Michaelson (12,700 feet?) in the Gorges valley. At a distance from the central core the radiating ridges become less abrupt and descend with a gentle gradient, finally passing somewhat abruptly, at a height of some 7000 feet, into the level plateau. These outer slopes are clothed with dense forest and jungle, composed chiefly of junipers and *Podocarpus*, and between 8000 and 9800 feet of huge bamboos. The forest zone extends to about 10,500 feet, above which is the steeper alpine zone, in which pasturages alternate with rocks and crags. This extends to a general height of about 15,000 feet, but in damp sheltered valleys the pasturages extend some distance higher. The only trees or shrubs in this zone are the giant *Senecio* (groundsel) and *Lobelia*, and tree-heaths, the *Senecio* forming groves in the upper valleys. Of the fauna of the lower slopes, tracks of elephant, leopard, and buffalo have been seen, between 11,500 and 14,500 feet. That of the alpine zone includes two species of Dassie (*Procapra*), a coney (*Hyrax*), and a rat (*Otomys*). The bird fauna, which resembles that of Mount Elgon, is of considerable interest, the finest species of the upper zone being an eagle-owl, met with at 14,000 feet. Both the fauna and flora of the higher levels present close affinities with those of other mountains of East Africa and of Cameroon. The true native names of the mountain are said to be Kilinyaga, Doenyo Ebor (white mountain), and Doenyo Egeri (spotted mountain). It was first seen, from a distance, by the missionary Krapf in 1849; approached from the west by Thomson in 1883; partially ascended by Teleki (1889), Gregory (1893), and Kolb (1896); and its summit reached by Mackinder in 1899.

See GREGORY. *The Great Rift-Valley*. London, 1896.—MACKINDER. "Journey to the Summit of Mount Kenya," *Geogr. Journal*, May 1900. (E. HE.)

Keokuk, a city of Lee county, Iowa, U.S.A., on the west bank of the Mississippi, near the mouth of the Des Moines, at an altitude of 505 feet. It obtains its water-supply from the Mississippi by the Holly pumping system. It has five railways: the Chicago, Burlington, and Quincy; the Chicago, Rock Island, and Pacific; the Keokuk and Western; the Toledo, Peoria, and Western; and the Wabash. These, with the Mississippi, give Keokuk a large trade. Population (1890), 14,101; (1900), 14,641, of whom 1778 were foreign-born and 1192 negroes.

Kerak, the ancient *Kir-Hareseth*, altitude 3300 feet, the chief town of a sanjak of the same name in the Suriya (Syrian) viláyet of Asiatic Turkey, and an important military station; situated east of the Dead Sea, in a fertile district, on a shelving rock-plateau almost encircled by deep ravines. It consists of a walled town, with a castle at its south end, which is isolated by a rock-hewn ditch—the whole forming an interesting specimen of a mediæval fortress. The original entrances were four winding rock-hewn passages, but the town is now entered through breaches in the walls, which were in a perfect state before the bombardment by Ibrahim Pasha in 1840. There are traces of Byzantine, Roman, and earlier occupation, including rock-hewn reservoirs, cisterns, and conduits. But the walls, standing on old foundations, are the work of the Crusaders and of their successors, the Eyúbites and the Memlúk sultans of Egypt. They were repaired by Sultan Bibars in the 13th century. The population (6000 Moslems and 1800 Orthodox Greek Christians) is of very mixed blood. Many of the Christians are of Egyptian origin, and the most influential Moslem families came from Hebron, which from a very early date has had close relations with Moab. The Greeks have two churches and a monastery; the Church Missionary Society, a station with a medical officer; and the Roman Catholics, a small monastery and church. Kerak was occupied and fortified by the Latin kings of Jerusalem in 1142, and was one of the great fortresses which commanded the important caravan routes from Egypt and Arabia to Damascus. It became the chief town of the Seigneurie of Kerak de Montréal, which included Hebron (Renaud, in a charter dated 1177, styles himself *Hebronensis et Montis Regalis dominus*); and whilst held by the notorious Renaud de Chatillon, 1177–87, it was repeatedly attacked by Saladin, to whom at last it surrendered in 1188. It continued to be a place of importance until the Turks occupied Palestine and Egypt. In 1893, after a period of semi-independence, it was strongly garrisoned by the Turks.

See DUC DE LUYNES. *Exploration de la Mer Morte*, ii. 106–129.—SCHLUMBERGER. *Renaud de Chatillon*, 1898.—TRISTRAM. *Land of Moab*. (C. W. W.)

Kerasund, the ancient *Pharnacia*, a town on the north coast of Asia Minor, in the Trebizond viláyet, and the port—an exposed roadstead—of Kara-hissar Sharki, with which it is connected by a carriage road. The town is situated on a rocky promontory, crowned by a Byzantine fortress, and has a growing trade. In 1899 the exports—hazel-nuts, walnuts, hides, and timber—amounted to £187,230, and the imports to £135,010. Its population consists of 4500 Moslems, 4000 Greeks, and 1000 Armenians. Pharnacia was the place from which the wild cherry was introduced into Italy by Lucullus, and it was afterwards called Cerasus by the Romans.

Kerbela, the chief town of a sanjak of the Baghdad viláyet of Asiatic Turkey, built round the spot where Hosein was murdered. It is the principal place of Shífte pilgrimage, and of its population (65,000) about 54,000 are Shíftes, chiefly Persians and British Indians.

Kerkuk, altitude 1100 feet, the chief town of the Shehrizor sanjak of the Mosul viláyet of Asiatic Turkey, and an important military station. It is a centre for the purchase of Arab horses for India. The population numbers about 10,000 Sunni Kúrds, with a few Christians and Jews.

Kermánsháh, an important province of Persia, situated west of Hamadán, north of Luristán, and south of Kurdistan, and extending in the west to the Turkish frontier. Its population is about 400,000, and it pays a yearly revenue of over £20,000. Many of its inhabitants

are nomadic Kurds and Lurs, who pay little taxes. The province produces much wheat and barley, and could supply great quantities of grain for export if means of transport were better. **KERMÁNSHÁH** (Kermánsháhán), the capital of the province, is situated at an elevation of 5100 feet in 34° 19' N., and 46° 59' E., about 220 miles from Baghdad, and 250 miles from Tehran. It has a population of about 35,000, post and telegraph offices, and is situated on the high road between Tehran and Baghdad, and carries on a great transit trade, estimated at £750,000 per annum.

Kerry, a maritime county of Ireland, province of Munster, bounded on the N. by the mouth of the Shannon, on the E. by Limerick and Cork, on the S. by Cork, and on the W. by the Atlantic.

Population.—The area of the administrative county in 1900 was 1,159,356 acres, of which 154,881 were tillage, 533,696 pasture, 161 fallow, 15,019 plantation, 62,819 turf bog, 39,404 marsh, 311,318 barren mountain, and 42,058 water, roads, fences, &c. The new administrative county, under the Local Government (Ireland) Act, 1898, is identical with the old judicial county. The population in 1881 was 201,039, and in 1891, 179,136, of whom 91,017 were males and 88,119 females, divided as follows among the different religions:—Roman Catholics, 173,195; Protestant Episcopalians, 5077; Methodists, 399; Presbyterians, 210; and other denominations, 255. The decrease of population between 1881 and 1891 was 10·89 per cent. The average number of persons to an acre was '15. Of the total population, 160,742 persons inhabited the rural districts, being an average of 89 persons to each square mile under crops and pasture. The population in 1901 was 165,331 (Roman Catholics, 160,209; Protestant Episcopalians, 4428; Methodists, 317; Presbyterians, 225; others, 152), being a decrease of 7·7 per cent. The following table gives the degree of education in 1891:—

	Males.	Females.	Total.	Percentage.			
				R. C.	Pr. Ep.	Presb.	Meth.
Read and write	57,007	51,538	108,545	67·2	91·0	97·0	89·8
Read only	5,961	5,886	11,847	7·5	4·1	0·5	4·6
Illiterate	18,099	21,174	39,273	25·3	4·9	2·5	5·6

The percentage of illiterates among Roman Catholics in 1881 was 36·1. In 1891 there were 8 superior schools, with 393 pupils (Roman Catholics 367, and Protestants 26), and 372 primary schools, with 33,779 pupils (Roman Catholics 32,834, and Protestants 945). The number of pupils on the rolls of the national schools on 30th September 1899 was 35,745, of whom 34,907 were Roman Catholics and 838 Protestants.

The following table gives the numbers of births, deaths, and marriages in the years specified:—

Year.	Births.	Deaths.	Marriages.
1881	5121	2731	630
1891	4218	2504	649
1900	3968	2622	660

The birth-rate per thousand in 1900 was 24·1, and the death-rate, 15·9; the rate of illegitimacy was 1·8 per cent. of the total births. The total number of emigrants who left the county between 1st May 1851 and 31st December 1899 was 207,786, of whom 103,797 were males and 103,989 females. The chief towns in the county, with their populations, are:—Tralee, 9318; Killarney, 5656; Listowel, 3800.

Administration.—The county is divided into four parliamentary divisions, north, south, east, and west, the number of registered electors in 1900 being respectively 5675, 5758, 6005, and 5845. The rateable value in 1900 was £304,275. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises 3 urban and 6 rural sanitary districts.

Agriculture.—The following table gives the acreage under crops, including meadow and clover, and the amount of live stock in 1881, 1891, 1895, and 1900:—

Year.	Wheat.	Oats.	Barley, Rye, Beans, &c.	Potatoes.	Turnips.	Other Green Crops.	Meadow and Clover.	Total.
1881	1032	27,538	4643	31,178	5723	5401	90,060	165,570
1891	2042	25,661	3833	27,906	6071	7153	95,862	168,583
1895	870	23,575	2966	25,283	0050	6718	99,321	165,033
1900	1891	20,747	2285	22,786	5509	7605	94,556	154,879

For 1899 the total value of the cereal and other crops was estimated by the Registrar-General at £1,032,005. The number of acres under pasture in 1881 was 566,950; in 1891, 518,613; and in 1900, 533,696.

Year.	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1881	18,868	11,402	242,322	132,196	62,963	26,462	552,812
1891	17,684	8,765	209,739	82,929	45,630	23,442	455,142
1895	18,252	12,304	233,195	115,735	60,199	21,599	537,238
1900	18,377	15,170	251,379	137,943	58,162	24,837	647,966

The number of milch cows in 1891 was 107,111, and in 1900, 108,384. It is estimated that the total value of cattle, sheep, and pigs in 1899 was £3,453,163. In 1900 the number of holdings not exceeding 1 acre was 2287; between 1 and 5, 1928; between 5 and 15, 3176; between 15 and 30, 3886; between 30 and 50, 3790; between 50 and 100, 3899; between 100 and 200, 1698; between 200 and 500, 600; and above 500, 110—total, 21,374. The number of loans issued (the number of loans being the same as the number of tenants) under the Land Purchase Acts, 1885, 1891, and 1896, up to 31st March 1900 was 1560, amounting to £668,456. The number of loans for agricultural improvements sanctioned under section 31 of the Land Act, 1881, between 1882 and 1900, was 1179, and the amount issued £71,685. The total amount issued on loan for all classes of works under the Land Improvement Acts, from the commencement of operations in 1847 to 31st March 1900, was £479,626, the largest amount issued in any county in Ireland.

Fisheries.—The number of vessels registered in 1899 in the deep sea and coast fishery districts of Valentia and Dingle was 822, employing 3487 men and boys. The number of persons employed in the same year in the salmon fishery districts of Kenmare and Killarney was 903. (W. H. Po.)

Kertch, a seaport of Russia, government of Taurida, on the Kertch Strait, chief town of the Kertch-Yenikale township (*gradonachalstvo*). Its mineral mud-baths, one of which is in the town itself and the other on the Chokrak lake (9 miles), are much visited. The population in 1897 was 28,946. Notwithstanding the deepening of the strait, which now allows ships to enter the Sea of Azov, Kertch retains its importance for the export trade in wheat, which is brought hither by coasting vessels to be mixed with the better sorts of American wheat before it is exported. There is a private museum (Novikoff's) of antiquities.

Very important finds of old Greek art continue to be made in the neighbourhood, as well as at Tamañ, on the east side of the Strait of Kertch. The catacombs on the northern slope of the Mitridates Hill, of which nearly 200 have been explored since 1859, possess considerable interest, not only for the relics of old Greek art which some of them contain (although most were plundered in earlier times), but especially as material for the history and ethnography of the Cimmerian Bosphorus. In 1890 the first Christian catacomb bearing a distinct date, 491, was discovered by Kulakovsky. Its walls proved to be covered with Greek inscriptions and crosses.

Keshub Chunder Sen [KESHAVA CHANDRA SENA] (1838–1884), Indian religious reformer, was born at Calcutta in 1838. His family belonged to one of the highest castes, and boasted a descent which could be traced through eight centuries. At the age of ten he lost his father, and was brought up under his mother's charge. He was sent to an English school, where he made good progress, and afterwards studied at the college of Calcutta, where he became proficient in English literature and history. In accordance with the Indian custom, he was married at eighteen to a child of ten. His family wished him to follow a business career, and a place was found for him in the Bank of Bengal, but his bent was towards literature and philosophy, and he soon

resigned his post in order to devote himself exclusively to these pursuits. At that time Sir William Hamilton, Blair, Parker, Cousin, Newman, and Emerson were among his favourite authors. Their works made the deepest impression on him, for, as he expressed it, "Philosophy first taught me insight and reflection, and turned my eyes inward from the things of the external world, so that I began to reflect on my position, character, and destiny." Like many other educated Hindus, Keshub Chunder Sen had gradually dissociated himself from the popular forms of the native religion, without abandoning what he believed to be its spirit. As early as 1857 he had joined the Brahma Somaj, founded in 1830 by Ram Mohun Roy, who aimed at initiating a religious reform from within, so as to worship Brahma the creator in accordance with what he believed to be the pure theism of the Vedas. His successor, Debendra Nath Tagore, gathered the worshippers into a stricter association with a definite theistic creed and moral code, and disavowed the Vedas because they recognized pantheism, transmigration, and other similar doctrines. Keshub Chunder Sen threw himself with enthusiasm into the work of this society, and in 1862 himself undertook the ministry of a theistic church. In the same year he helped to found the Albert College, and started the *Indian Mirror*, a weekly journal in which social and moral subjects were discussed. He also travelled about the country lecturing and preaching. Little by little he had drifted away from Debendra Nath Tagore, who wanted to revive the Hinduism of the Upanishads, while Chunder Sen's sympathies were more catholic and extended to the teachings of Jesus. He also desired to bring about various reforms, such as the remarriage of widows and the abolition of caste. The result was a split in the society, which broke up into two sections, Chunder Sen putting himself at the head of the reform movement, which took the name Brahma Somaj of India, and tried to propagate its doctrines by missionary enterprise. Its tenets at this time were the following:—1. The wide universe is the temple of God. 2. Wisdom is the pure land of pilgrimage. 3. Truth is the everlasting scripture. 4. Faith is the root of all religions. 5. Love is the true spiritual culture. 6. The destruction of selfishness is the true asceticism. In 1866 he delivered an address on "Jesus Christ, Europe and Asia," which caused a good deal of stir, and led to the false impression that he was about to embrace Christianity. This helped to call attention to him in Europe, and an invitation to visit England was accepted in 1869. The visit was paid in 1870. The Hindu preacher was warmly welcomed by almost all denominations, particularly by the Unitarians, with whose creed the Brahma Somaj had most in common, and it was the committee of the British and Foreign Unitarian Association that organized the welcome soiree at Hanover Square Rooms on 12th April. Ministers of ten different denominations were on the platform, and among those who officially bade him welcome were Lord Lawrence and Dean Stanley. He remained for six months in England, visiting most of the chief towns, where he lectured, preached, &c., in all addressing over seventy meetings. His eloquence, delivery, and command of the language won universal admiration. His own impression of England was somewhat disappointing. Christianity in England appeared to him too sectarian and narrow, too "muscular and hard," and Christian life in England more materialistic and outward than spiritual and inward. "I came here an Indian, I go back a confirmed Indian; I came here a Theist, I go back a confirmed Theist. I have learnt to love my own country more and more." These words spoken at the farewell soiree may furnish the key to the change in him which so greatly puzzled many of

his English friends. He developed a tendency towards mysticism and a greater leaning to the spiritual teaching of the Indian philosophies. Outwardly, too, he returned in many respects to the customs of his country. He gave his child daughter in marriage to the maharaja of Kuch Behar; he revived the performance of mystical plays, and himself took part in one. These changes alienated many of his followers, who deserted his standard and joined the more conservative section. Two lectures delivered between 1881 and 1883 throw a good deal of light on Chunder Sen's latest doctrines. They were "The Marvellous Mystery, the Trinity," and "Asia's Message to Europe." This latter is an eloquent plea against the Europeanizing of Asia, as well as a protest against Western sectarianism. During the intervals of his last illness he wrote the *New Samhita, or the Sacred Laws of the Aryans of the New Dispensation*. He died in January 1884, leaving many bitter enemies and many warm friends. (A. Z.)

Keswick, a township, market town, and railway station, in the Penrith parliamentary division of Cumberland, England, near Derwentwater, 16 miles west by south of Penrith. Recent erections include a cottage hospital and a pavilion with a large hall and other accommodation. A public park of 28 acres was provided in 1887. Area of township, 718 acres. Population (1881), 3201; (1901), 4451.

Keswick Convention, an annual summer reunion held at Keswick (24 miles from Carlisle), for the main purpose of "promoting practical holiness" by meetings for prayer, discussion, and personal intercourse. Though it has no denominational limits, it is chiefly supported by the "Evangelical" section of the Church of England. The meetings are held in a large tent. Sometimes as many as 10,000 people are present during the week. The rise of the Convention should be viewed in connexion with the religious revival of the 'seventies (various "conferences" on the spiritual life, visit of Moody and Sankey, rise of parochial and numerous home missions, &c.). The revival was primarily concerned with individual piety, but the interest awakened soon expanded into vigorous missionary enthusiasm.

The Convention, started in a private manner by Canon Harford Battersby in 1875, rapidly grew after the first few years, both in numbers and influence, in spite of attacks on the alleged "perfectionism" of some of its leaders and on the novelty of its methods. Its immediate aim has always been to deepen personal religion, but some indication of its success may be seen in the interest taken by its members in foreign missions. As an instance it may be mentioned that, in consequence of the first missionary meeting of the Convention (1887), seventeen women missionaries went out to the foreign field. In the *History of the C.M.S.*, vol. iii. (by Eugene Stock) the missionary influence of the "Keswick men," in Cambridge and elsewhere, may be readily traced. Cf. the brief sketch, PIERSON, *The Story of Keswick*. (G. E. N.)

Ketteler, Wilhelm Emmanuel, BARON VON (1811–1877), German theologian and politician, was born at Harkotten, in Bavaria, 25th December 1811. He studied theology at Göttingen, Berlin, Heidelberg, and Munich, and was ordained priest in 1844. From that period he resolved to consecrate his life to maintaining the cause of the freedom of the Church from the control of the State. This brought him into collision with the civil power, an attitude which he maintained throughout the whole of a stormy and eventful life. Ketteler was rather a man of action than a scholar, and he first distinguished himself as one of the deputies of the Frankfort National Assembly, a position to which he was elected in 1848, and in which he soon became noted for his decision, foresight, energy, and eloquence. In 1850 he was made bishop of Mainz, by order of the Vatican, in preference to the celebrated Professor Leopold Schmidt, of Giessen, who had been duly elected to the post, but whose Liberal

sentiments were not agreeable to the Papal party. When elected, Ketteler refused to allow the students of theology in his diocese to attend lectures at Giessen, and ultimately founded an opposition seminary in the diocese of Mainz itself. He carried on his warfare with the State in a manner equally uncompromising. Not content with establishing his seminary for priests, he founded orders of School Brothers and School Sisters, to work in the various educational agencies he had called into existence, and he industriously laboured to institute orphanages and rescue homes. In 1858 he threw down the gauntlet against the State in his pamphlet on the rights of the Catholic Church in Germany. In 1863 he took the further step of espousing the cause of the masses against the classes by adopting Lassalle's Socialistic views, and published his *Die Arbeitsfrage und das Christenthum*. When the question of Infallibility arose, he opposed the promulgation of the dogma at first on the ground that such promulgation was inopportune. But he was not very resolute in his opposition. The opponents of the dogma complained at the very outset that he was wavering, half converted by his hosts, the members of the German College at Rome, and further influenced by his own misgivings. He soon deserted his anti-Infallibilist colleagues, and submitted to the decrees in August 1870. He was the warmest opponent of the State in the *Kulturkampf* provoked by Prince Bismarck after the publication of the Vatican decrees, and was largely instrumental in compelling that statesman to retract the pledge he had rashly given, never to "go to Canossa." To such an extent did Bishop von Ketteler carry his opposition, that in 1874 he forbade his clergy to take part in celebrating the anniversary of the battle of Sedan, and declared the Rhine to be a "Catholic river." After this little was heard of him. He died at Burg-hausen, Upper Bavaria, on 13th July 1877. (J. J. L*.)

Kettering, a market town in the eastern parliamentary division of Northamptonshire, England, 14 miles north-east of Northampton by rail. Recent erections include Established and Roman Catholic churches, a Victoria Hall, a free library, two hospitals for infectious diseases, and a general hospital. There are an endowed grammar-school and a cattle-market. Area of parish (an urban district), 2814 acres. Population (1881), 11,095; (1901), 28,653.

Kettle, Sir Rupert Alfred (1817–1894), English county court judge, was born at Birmingham, 9th January 1817. His family had for some time been connected with the glass-staining business. In 1845 he was called to the bar, and in 1859 he was made judge of the Worcestershire county courts, becoming also a bencher of the Middle Temple (1882). His title to fame rests mainly on his association with the movement for establishing arbitration in trade disputes. He acted as arbitrator in several important strikes, and besides being the first president of the Midland iron trade wages board, he was largely responsible for the formation of similar boards in other staple trades. His name thus became identified with the organization of a system of arbitration between employers and employed, and in 1880 he was knighted for his services in this capacity. In 1851 he married; one of his sons subsequently became a London police magistrate. Sir Rupert Kettle died on 6th October 1894, at Wolverhampton. He was the author of several important books dealing with the settlement of labour disputes.

Kewanee, a town of Henry county, Illinois, U.S.A., on the Chicago, Burlington, and Quincy railroad, at an altitude of 847 feet. Its manufactures in large part are agricultural implements, waggons, and carriages.

Population (1880), 4207; (1900), 8382, of whom 2006 were foreign-born.

Key, Sir Astley Cooper (1821–1888), English admiral, son of Charles Aston Key (1793–1849), a well-known surgeon, pupil of Sir Astley Cooper, whose niece he married, was born in London in 1821, and entered the navy in 1833. After distinguishing himself in active service abroad, on the South American station (1844–46), in the Baltic during the Crimean war (C.B. 1855), and China (1857), he was appointed in 1858 a member of the royal commission on national defence, in 1860 captain of the steam reserve at Devonport, and in 1863 captain of H.M.S. *Excellent* and superintendent of the Royal Naval College. He had a considerable share in advising as to the reorganization of administration, and in 1866, having become rear-admiral, was made director of naval ordnance. Between 1869 and 1872 he held the offices of superintendent of Portsmouth dockyard, superintendent of Malta dockyard, and second in command in the Mediterranean. In 1872 he was made president of the projected Royal Naval College at Greenwich, which was organized by him, and after its opening in 1873 he was knighted (K.C.B.) and made a vice-admiral. In 1876 he was appointed commander-in-chief on the North American and West Indian station. Having become full admiral in 1878, he was appointed in 1879 principal A.D.C., and soon afterwards First Naval Lord of the Admiralty, retaining this post till 1885. In 1882 he was made G.C.B. He died at Maidenhead, 3rd March 1888.

Key West, capital of Munroe county, Florida, U.S.A., on a small island of the same name, south-west of the southern point of the peninsula of Florida. Being in a commanding position at the entrance to the Gulf of Mexico, it is the site of a naval station, which is defended by Fort Taylor. Most of the island is occupied by this station, but there are also several extensive cigar factories, in which Cuban leaf is made into "Key West" cigars. This has been the chief, almost the only, business of the inhabitants. In recent years, however, much of this manufacture has removed to Tampa, and with it has gone a part of the population. During the war between the United States and Spain, Key West became a very important rendezvous and supply point. Population (1890), 18,080; (1900), 17,114, of whom 7266 were foreign-born and 5562 negroes.

Kezanlik, or KASANLIK, chief town of a department in the principality of Bulgaria, dominated on the north by the Balkans, at the southern termination of the Shipka pass, on a tributary of the Maritza, about 20 miles north-west of Eski Sagra, and 59 north of Philippopolis. It possesses a higher-class school. The town is the centre of the attar of rose trade in Bulgaria, the whole of the Kezanlik valley being occupied by fields of roses. Cloth is also manufactured. It was from Kezanlik that the Turks during the war of 1877–78 directed their attacks against the Russians who held the Shipka pass. Population (1893), 10,765, of whom about one-seventh are Turks.

Khabarovsk, a town of Asiatic Russia, capital of the Amur region, of the Maritime Province, and of the Khabarovsk district which comprises the lower Amur from its junction with the Usuri to its mouth. It was founded in 1855, and is built on a high cliff on the right bank of the Amur, at its confluence with the Usuri, 48° 28' N., 135° 6' E., 5532 miles east of Moscow by railway to Sryetensk, and thence down the Shilka and the Amur. It became a town in 1880, when it was made the seat of the governor-general of the Amur region (provinces—Amur, Maritime, and Sakhalin Island). It is con-

nected by rail with Vladivostock (469 miles), a branch railway being built from this main trunk to Port Arthur. The thick forests surrounding the town, now cleared to some extent, offer no facilities for agriculture, but its position at the junction of two great rivers makes of it an important entrepôt for goods coming from the Usuri and its tributary the Sungacha, as well as a centre of trade and administration. The town is built of wood, and has a great cathedral, barracks, a corps of cadets, a monument to Count Muravieff-Amurskiy, and large storehouses. It has also a branch of the Russian Geographical Society, a good museum, and a rich library, a technical railway school, a gymnasium for girls, various primary schools, and two philanthropic institutions. Population (1897), 15,082.

Khaibar Pass, the most important of the passes which lead from India to Afghanistan. The mountain barrier which separates the Peshawur plains from the Afghan highlands differs in many radical respects from the mountain barrier which intervenes between the Indus plains and the plateau farther south. To the south this barrier consists of a series of flexures folded parallel to the course of the river, through which the plateau drainage breaks down in transverse lines forming gorges and clefts as it cuts through successive ridges. West of Peshawur the strike of the mountain systems is roughly from west to east, and this formation is maintained with more or less regularity as far south as the Tochi river and Waziristan. Almost immediately west of Peshawur, and stretching along the same parallel of latitude from the meridian of Kabul to within 10 miles of the Peshawur cantonment, is the great central range of the Saféd Koh, which forms throughout its long, straight line of rugged peaks the southern wall, or water-divide, of the Kabul river basin. About the meridian of 71 E. it forks, sending off to the north-east what is locally known as a spur to the Kabul river, but which is geographically only part of that stupendous water-divide which hedges in the Kunar and Chitral valleys, and which, under the name of the Shandur range, unites with the Hindu Kush near the head of the Taghdumbash Pamir. The Kabul river does not really terminate this northern spur of the Saféd Koh; it breaks through it, and in breaking through it is forced to the northward in a curved channel or trough, deeply sunk in the mountains between terrific cliffs and precipices, where its narrow waterway affords no foothold to man or beast for many miles. To reach the Kabul river in the Afghan territory it is necessary to pass over this water-divide; and the Khaibar stream, flowing down from the pass at Lundi Kotal to a point in the plains opposite Jamrud, 9 miles to the west of Peshawur, affords the opportunity.

From its commencement amongst the foothills opposite Jamrud to the Lundi Kotal, the road (now a driving road) follows much the same alignment as that adopted in the first Afghan war of 1839-43. It winds amidst mountains, and is flanked by cliffs and dominating hills throughout its course. About half-way between Jamrud and Lundi Kotal the hill fortress of Ali Masjid, perched on a comparatively isolated spur, absolutely bars the way. It is the key to the Khaibar; but as the road approaches, it reaches to a height which very considerably reduces the command of the fort, which is not quite so formidable as it appears. From Ali Masjid to the fortified position at Lundi Kotal the road is more open, but it is everywhere a road of the mountains and not of the plains. At Lundi Kotal (3600 feet) the Khaibar ends, and the drop northwards to Lundi Khana and by the Okha Khwar nullah to Dakka and the Kabul is through Afghan territory.

The Khaibar has been adopted by the British as the main

road to Kabul, but its difficulties, before they were overcome by British engineers, were such that it was never so regarded by former rulers of India. The old road to India left the Kabul river near its junction with the Kunar, and crossed the great divide between the Kunar valley and Bajaor; then it turned southwards to the plains. The difficulty which the British authorities experienced with the Khaibar was chiefly in maintaining and guarding it against tribal attack. The tribes occupying the mountains which flank it and the villages in its immediate neighbourhood are the Zakka Khel Afridis. Farther to the north, within the Kabul bend, and clustering in the open spaces and uplands which lie beyond the dominating peaks of Torsappa (5350 feet), are the Mohmands, a tribe of Afghan extraction, who as a rule give little trouble, as they possess commercial and agricultural relations in the Peshawur valley. Of late years the Khaibar has been held by Afridi levies drawn chiefly from other clans than the Zakka, and officered by natives. The failure in 1896 to retain the command of the pass, when the Zakka Afridis combined to attack these other Afridi levies (who were unsupported by British troops), induced the Government of India to alter this system. The Afridi levies who defended the pass with great courage and determination against their fellow tribespeople were still retained as guardians of the Khaibar, but they were commanded by British officers.

See Sir R. WARBURTON. *Eighteen Years in the Khaibar*. London, 1900. (T. H. H*.)

Khairagarh, a feudatory state of India, in the Chhattisgarh division of the Central Provinces. Area, 940 square miles; population (1881), 166,138; (1891), 181,184; average density, 199 persons per square mile. In 1901 the population was 137,542, showing a decrease of 24 per cent., due to the results of famine. The estimated revenue was Rs.2,25,000; tribute, Rs.70,000. The chief, who is descended from the old Gond royal family, received the title of raja as a hereditary distinction in 1898. The state includes a fertile plain, yielding rice and cotton. Its prosperity has been promoted by the Bengal-Nagpur railway, which has a station at Dongargarh, connected by road with Khairagarh town, the residence of the raja.

Khairuddin (*Khair-ed-Din*—"Joy of Religion") (—1890), Turkish statesman, was of Circassian race, but nothing is known about his birth and parentage. In early boyhood he was in the hands of a Tunisian slave-dealer, by whom he was sold to Hamuda Pasha, then bey of Tunis, who conceived a great affection for the lad, and gave him his freedom and a French education. When Khairuddin left school the bey made him steward of his estates, and from this position he rose to be minister of finance. When the prime minister, Mahmud ben Ayad, absconded to France with the treasure-chest of the principality, Hamuda despatched Khairuddin on a mission to the French Government to obtain the extradition of the fugitive. The mission failed; but the six years it occupied enabled Khairuddin to make himself widely known in France, to become acquainted with French political ideas and administrative methods, and, on his return to Tunis, to render himself more than ever useful to his Government. Hamuda died while Khairuddin was in France, but he was highly appreciated by the three beys—Ahmet (1837), Mohammed (1855), and Sadok (1859)—who in turn followed Hamuda, and to his influence was due the sequence of liberal measures which distinguished their successive reigns. But although Khairuddin's protracted residence in France had imbued him with liberal ideas, it had not made him a French partisan, and he strenuously opposed the French scheme of establishing a protectorate

over Tunis upon which France embarked in the early 'seventies. This rendered him obnoxious to Sadok's prime minister—an apostate Jew named Mustapha ben Ismael—who finding his purposes thwarted by Khairuddin, intrigued against him and succeeded in completely undermining the bey's confidence in him. His position thus became untenable in Tunis, and shortly after the accession of Abdul Hamid he acquainted the sultan with his desire to enter the Turkish service. In 1877 the sultan bade him come to Constantinople, and on his arrival gave him a seat on the Reform Commission then sitting at Tophane. Early in 1879 the sultan appointed him grand vizier, and shortly afterwards he prepared a scheme of constitutional government, but Abdul Hamid refused to have anything to do with it. Thereupon Khairuddin resigned office, on the 28th July 1879. More than once the sultan offered him anew the grand vizierate, but Khairuddin persistently refused it, and thus incurred disfavour. Gouty and otherwise ailing, Khairuddin repeatedly but vainly sought leave of the sultan to go abroad and recruit his health. He died in February 1890, practically a prisoner in his own house.

Khairpur, a native state of India, in the Sind province of Bombay. Area, 6109 square miles; population (1891), 131,937; average density, 22 persons per square mile. In 1901 the population was 199,565, showing an apparent increase of 51 per cent. The estimated revenue was Rs.11,38,000; number of police, 181; number of schools (1897-98), 110, with 3754 pupils. The title of G.C.I.E. was conferred upon the present Mir on the occasion of Queen Victoria's Diamond Jubilee. He takes an active interest in improving his state, and especially in education. **KHAIRPUR** town is situated in 27° 31' N. and 68° 48' E., on a canal about 15 miles east of the Indus; railway station, 20 miles south of Sukkur, on the Kotri-Rohri branch of the North-Western railway, which here crosses a corner of the state. Population (1891), 6240.

Khamgaon, a town of India, in the Akola district of Berar, 340 miles north-east of Bombay. The population in 1881 was 12,390, and in 1891 it was 15,598; the municipal income in 1896-97 was Rs.26,164. It is an important centre of the cotton trade, with nine ginning factories and five presses, turning out 43,000 bales. It was connected in 1870 with the Great Indian Peninsula railway by a branch line (7½ miles).

Khamseh, a small but important province of Persia, between Kazvin and Tabriz. It consisted formerly of five districts, whence its name Khamseh, "the five," but is now subdivided into seventeen districts. The language of the inhabitants is Turkish. The province pays a revenue of about £20,000 per annum, and its capital is Zanjan.

Khandesh, a district of British India, in the Deccan division of Bombay. The present headquarters are at Dhulia, but the railway junction of Bhusawal is the centre of trade. Area, 10,907 square miles; population (1881), 1,252,016; (1891), 1,460,851, showing an increase of 17 per cent.; average density, 134 persons per square mile. In 1901 the population was 1,460,652, showing an increase of less than 2 per cent. The land revenue and rates were Rs.47,33,892, the incidence of assessment being R.1:4:9 per acre; cultivated area (1897-98), 3,004,057 acres, of which 67,692 were irrigated from wells, &c., including 13,610 acres from Government canals; number of police, 1858; children at school (1897-98), 28,916, being 2.1 per cent. of the total population; registered death-rate (1897), 48.82 per thousand. The principal crops are millet, cotton, pulse, wheat, and oil-seeds. There are 70 factories for ginning and pressing cotton; a cotton-mill at

Jalgaon, with 411 looms and 20,000 spindles, employing 1300 hands; and six printing-presses, each issuing a vernacular newspaper of small circulation. The district is traversed for 124 miles by the Great Indian Peninsula railway, which branches at Bhusawal (where there is a bridge over the Tapti) towards Jubbulpore and Nagpur. It is also crossed by the Tapti Valley line from Surat. It suffered somewhat from famine in 1896-97, and more severely in 1899-1900.

Khandwa, a town of British India, in the Nimar district of the Central Provinces, of which it is the headquarters, 353 miles north-east of Bombay by rail. Population (1881), 15,152; (1891), 15,589. Khandwa is an ancient town, with Jain and other temples. As a centre of trade, it has superseded the old capital of Burhanpur. It is an important railway junction, where the Malwa line from Indore meets the main line of the Great Indian Peninsula. There are eight steam factories for ginning and pressing cotton; an unaided high school, and railway school for Europeans; and a printing-press, issuing a vernacular newspaper.

Khár, a small but very fertile province of Persia, known by the ancients as Choara and Choarene. It has a population of about 10,000. The governor of the province resides at Kishlák Khár, a large village situated 62 miles south-east of Tehran, or at Aradán, a village with post and telegraph offices, 9 or 10 miles farther east. The province has an abundant water-supply from the Hableh-rúd, and produces great quantities of wheat, barley, and rice. Of the £6000 which it pays to the State, more than £4000 is paid in kind—wheat, barley, straw, and rice. It is held in fief by the minister of Crown domains (Khalisseh).

Kharkoff, a government of Little Russia, belonging partly to the basin of the Don and partly to that of the Dnieper. Area, 21,041 square miles; population, 2,036,949 in 1882; 2,509,811 in 1897, of whom 1,242,892 were women and 367,602 lived in towns; 63 per cent. of the land is owned by the peasants, 25 per cent. by the nobility, 6 per cent. by owners of other classes, and 6 per cent. by the Crown and other institutions. Agriculture is the chief occupation, and the crops in an average year are wheat, 1,080,000 quarters; rye, 1,805,000; oats, 1,100,000; barley, 724,000; millet, sarrazin, and Indian corn, 380,000; potatoes, 433,000 quarters. There remain in an average year 161,150 tons of grain available for export. Flax, hemp, and tobacco are also widely cultivated. Gardening and kitchen gardening are common pursuits. There were in 1895, 330,000 horses, 610,000 cattle, and about 1,080,000 sheep. Domestic industries are not widely developed, and industries, except sugar, have not a great development, their aggregate yearly returns being about £4,200,000. Sugar works—chiefly about Sumy—are the chief of them (over £2,500,000); but there are also distilleries, wool-cleaning works, steam flour-mills, and tobacco works. Salt is extracted at Slavyansk. The government is divided into eleven districts, the chief towns of which, with their populations in 1897, are Kharkoff (174,846), Akhtyrka (23,390), Bogodukhoff (11,928), Izyum (12,959), Kupyansk (7797), Lebedin (14,206), Starobyelsk (13,128), Sumy (27,575), Valki (8842), Volchansk (11,322), and Zmiyeff (4652).

Kharkoff, capital of the above province, 480 miles by rail south of Moscow. It grew rapidly during the last quarter of the 19th century, and has now 174,846 inhabitants (about 195,000 with its suburbs). Of these, 170,000 are Russians, 16,500 Jews, 3500 Poles, and 2000 Germans. The town has been embellished with new buildings, schools, hospitals, &c. Its factories (wool, flour-mills, tobacco,

confectionery, &c.) show an aggregate yearly return of about £600,000. Its importance as an intellectual centre for Little Russia and as a commercial centre for a wide region is steadily growing. Sugar, raw wool, oil, tobacco, wine, crockery, and textile goods, as also cattle hides, tallow, &c., are the chief items of trade.

Kharpút, the most important town in the Memuret el-Azíz viláyet of Asia Minor, altitude 4350 feet, situated a few miles south of the Murád Su or Eastern Euphrates, on the Samsún-Sivas-Diarbekr road. The town is built on a hill-terrace about 1000 feet above a well-watered plain of exceptional fertility which lies to the south and supports a large population. On a rocky eminence east of the town is the castle in which Jocelyn, Count of Edessa, and Baldwin II. were imprisoned. Kharpút is an important station of the American missionaries, who have built a college, a theological seminary, and boys' and girls' schools. In November 1895 Kúrds looted and burned the Armenian villages on the plain; and in the same month Kharpút was attacked, the American schools burned down, and "Euphrates" College shelled by Turkish troops in the presence of the governor of the viláyet. A large number of the Gregorian and Protestant Armenian clergy and people were massacred, and churches, monasteries, and houses were looted. The viláyet was founded in 1888, and is divided into three sanjaks—Kharpút, Malatia, and Dersim. It has much mineral wealth, a healthy climate, and a fertile soil. The population comprises 500,000 Moslems and 80,000 Christians, nearly all Armenians. The seat of government, Mezere, is on the plain, three miles south of Kharpút, and is strongly garrisoned.

Khartum, capital of the Anglo-Egyptian Sudan, and before the Mahdist revolt (1883) administrative centre of the Khedivial possessions in the Upper Nile basin. It takes its Arabic name ("Elephant's Trunk") from the form of the tongue of land at the confluence of the two Niles, about 1340 miles south of Cairo, with which it has been connected by rail since 1899. After its capture in January 1885 it was abandoned by the Mahdi, who established himself at Omdurman on the opposite (left) bank of the White Nile, and this place remained the headquarters of his successor, the Khalifa Abdullah, till September 1898, when it was taken by the Anglo-Egyptian forces under General (afterwards Lord) Kitchener, and the seat of government again transferred to Khartum. It had a population estimated before the revolt at about 70,000, and has once more risen from its ruins and been in great part rebuilt. In 1901 it numbered over 20,000 inhabitants, attracted by the security for life and property guaranteed by the British and Egyptian Government. Conspicuous amongst the new buildings is the Gordon College, which stands on the spot where the hero fell, and was founded in 1899 for the twofold purpose of commemorating his name and affording useful instruction to the surrounding peoples. Lying at an altitude of 1200 feet above sea-level, about the limits of the northern dry and the southern moist zone, Khartum has a moderate annual rainfall of some 40 inches, with a fairly salubrious climate, which has attracted European visitors, especially during the winter season. It is becoming again the headquarters of missionary work, the starting-point of all travellers proceeding by the Nile route to the interior, and the chief centre of commercial enterprise and civilizing influences in Anglo-Egyptian Sudan.

(A. H. K.)

Khasi and Jaintia Hills, a district of British India, in the Hills division of Assam. It occupies the central plateau between the valleys of the Brahmaputra and the Surma, rising very abruptly on the south side.

The Khasi Hills are inhabited by a tribe of the same name, who still live in primitive communities under elective chiefs in political subordination to the British Government. There are 25 of these chiefs, called *Siems* and by other names, who exercise independent jurisdiction and pay no tribute. The Jaintia Hills used to form a petty Hindu principality, which was annexed in 1835. The inhabitants are a quite distinct tribe, called Panar or Santeng. The headquarters of the district were transferred in 1864 from Cherrapunji to Shillong, which is also the capital of the province. Area, 6041 square miles; population (1881), 169,360; (1891), 197,904, showing an increase of 17 per cent.; average density, 33 persons per square mile. Hill tribes numbered 185,364; Christians, 7144, of whom 164 were Europeans, the remainder representing the work of the Welsh Calvinistic mission among the Khasias. In 1901 the population was 198,989, showing an increase of less than 1 per cent. The land revenue was Rs.1,97,904, the incidence of assessment being nearly Rs.2 per acre; number of police, 178; number of boys at school (1896-97), 4180, being 29.45 per cent. of the male population of school-going age; number of girls at school, 1806, or 11.65 per cent., comparing with 1.33 per cent. for the province generally; registered death-rate in selected areas (1897), 52.94 per thousand. In 1897 there was 1 tea-garden, with 30 acres under tea, yielding 4000 lb. There are 8 limestone quarries, from which 1,630,000 mannds were exported in 1896-97, yielding to Government an annual revenue of Rs.18,000. There are also a few coal-mines, which are worked on a small scale. A good cart-road runs north from Cherrapunji through Shillong to Gauhati on the Brahmaputra; total length, 94 miles. On the Sylhet border there is a small state railway 8 miles long, on the 2½-foot gauge, for conveying limestone to the river mart, and using local coal. It was wrecked by the earthquake of 12th June 1897, and again damaged by heavy floods; but it was reopened in March 1898. The district was the focus of the great earthquake, which not only destroyed every permanent building, but also broke up the roads and caused many landslips. Among the cliff villages near Cherrapunji the loss of life was about 600.

Kheri, a district of British India, in the Lucknow division of Oudh, which takes its name from an insignificant town; railway station 81 miles north-west of Lucknow. Population (1881), 5996. The administrative headquarters are at Lakhimpur, 3 miles distant; population (1891), 8073. The district has an area of 2965 square miles; population (1881), 831,922; (1891), 903,615, showing an increase of nearly 9 per cent., which has been continuous since 1869; average density, 305 persons per square mile, being far the lowest in the province. In 1901 the population was 905,199, showing only an infinitesimal increase. The land revenue and rates were Rs.8,98,633, the incidence of assessment being nearly 9 annas per acre; cultivated area (1896-97), 716,809 acres, of which 27,003 were irrigated from wells and tanks; number of police, 2740; vernacular schools (1896-97), 63, with 2855 pupils; death-rate (1897), 34.26 per thousand. The district is now traversed by a branch of the Oudh and Rohilkhand railway from Lucknow to Bareilly.

Kherson, a government of south-west Russia, on the north coast of the Black Sea. Area, 27,523 square miles. The population of the government reached in 1897, 2,732,832, of whom 1,332,175 were women and 785,094 lived in towns (including Odessa). Nearly 45 per cent. of the land is owned by the peasants, 31 per cent. by the nobility, 12 per cent. by other classes, and 12 per cent.

by the Crown, the municipalities, and other institutions. The peasants rent as much as 1,730,000 acres more from the landlords. Forests are scarce (176,500 acres). Owing to the fertility of the soil and the proximity of markets, agriculture is well developed and 8,900,000 acres are under crops. Agricultural machinery is widely used. The crops in an average year are wheat 2,274,000, rye 1,830,000, barley 1,191,000, oats 650,000, millet, sarrazin, and Indian corn 491,000 quarters. It is estimated that the available surplus of grain amounts to 412,500 tons every year. Flax is also cultivated and gardening prospers. The vine is widely grown, yielding 1,220,000 gallons of wine; the yearly manufacture of tobacco reaches 5000 cwt. There were in 1895 over 400,000 horses, 3,600,000 horned cattle, and 2,000,000 sheep. The aggregate annual returns of the factories attain £4,500,000, and they give occupation to nearly 11,000 persons. There are a few iron works (£100,000); machinery and especially agricultural machinery works (£175,000), sugar works (£1,020,000), stean flour works (£700,000), chemical works, &c. The traffic on the railways and the rivers is very large, owing to the trade of Odessa. The government is divided into six districts, the chief towns of which are Kherson, capital of the province (69,219), Alexandriya (14,002), Ananieff (16,713), Elisavetgrad (61,841), Odessa (405,041), and Tiraspol (27,585). Odessa with its suburbs constitutes a separate township.

Khingan, Great, a range of mountains of eastern Asia, of considerable length and great orographical importance. It is not a range of the alpine type, but the eastern border ridge of the immense plateau of eastern Asia which may be traced from the Himalaya to Bering Strait and from the Tian Shan to the Khingan. The plateau consisting in the south of the terraces of Tibet, and including in the west the very high terrace of the Pamir, has also, in north-west Mongolia and East Siberia, two well-defined terraces separated from each other by the Kentei range and the Yablonovoi Khrebet. The upper terrace comprises north-west Mongolia, and, beyond the trench of the Selenga, the Vitim plateau, whose continuation beyond the 120th degree of longitude is only partially explored. The lower terrace of the plateau, from 2500 to 3000 feet of average altitude, includes eastern Mongolia, the Gobi (see MONGOLIA), the Nerchinsk prairies of Transbaikalia, and the region watered by the upper Zeya, a tributary of the Amur.

The Great Khingan is well known from the 50th degree of latitude, where it was crossed by the present writer, to Kalgan, where it is crossed by the highway leading from Urga to Peking. It appears on this stretch as a border ridge of the Mongolian plateau, having very great orographical importance, since it represents an important climatic and geographic botanical boundary, constituting as it does the western limits of the Manchurian flora. The base of its western slope, which is very gentle, lies at altitudes of from 3000 to 3500 feet. Its crest rises to from 4800 to 6000 feet; and its eastern slope is extremely rapid as it falls to the plains of Manchuria, which have only from 1500 to 2000 feet of altitude. On this stretch one or two subordinate ridges parallel to the main border ridge and separated from it by longitudinal valleys are found to fringe its eastern slope, thus marking two different terraces and giving to the whole system a width of from 80 to 100 miles. Basalts, trachytes, and other volcanic formations are found in the main border ridge and on its south-eastern slopes.

To the south-west of Peking the Great Khingan is continued by the Inshan mountains, which exhibit similar characters to those of the Great Khingan, and represent the like terrace-shaped escarpment of the Mongolian plateau. Moreover, it appears from the map of the Russian General Staff (surveys of Skassi, Obrucheff, Potanin, &c.) that similar terrace-shaped escarpments—but considerably wider apart than in Manchuria—occur in the Shan-si province of China, along the southern border of the South Mongolian plateau. These escarpments are pierced by the Yellow river or Hoang-ho south of the Great Wall, between the 39th and 38th degrees of latitude, and in all probability it will be found that a border range homologous to the Great Khingan separates the upper tributaries of

the Hoang-ho (namely the Dao-ho) from those of the Yang-tse-kiang. It must, however, be noticed that, according to Obrucheff, the escarpments of the Wei-tsi-shan and Lu-huang-lin, by which the southern Ordos falls towards the Wei-ho (tributary of the Hoang-ho), can hardly be taken as corresponding to the Kalgan escarpment. They fall with gentle slopes only towards the high plains lying to the south of them, while a steep fall towards the low plains seems to be found only farther south, between the 32nd and 34th degrees of latitude. It thus remains to be discovered whether the southern continuations of the Great Khingan, southwards of the 38th degree, are not wider than in higher latitudes, and do not consist of two separate escarpments. At its northern end the place where the Great Khingan is pierced by the Amur has not yet been ascertained by direct observation. The reasons why the present writer considers that the upper Amur emerges from the high plateau and its border-ridge, the Khingan, below Albazin and above Kumara have been stated in his sketch of the orography of East Siberia published in 1876 (French translation, with addenda, published by the Institut Géographique of Brussels in 1902). If this view prevail, and Petermann has adopted it for his map of Asia, and it has been maintained in all the Gotha publications, it will appear that the Great Khingan joins the Stanovoi ridge or Jukjur, in that portion of it which faces the western coast of the Sea of Okhotsk. At any rate the Khingan, separating as it does the Mongolian plateau from the much lower plains of the Sungari and the Nonni, is perhaps the most important division-line in eastern Asia. It sharply separates the Mongolian plateau from the Manchurian plains, and the dry Mongolian landscape and flora from those of Manchuria and the Pacific.

See the earlier bibliography in SEMENOFF'S *Geographical Dictionary*.—D. V. PUTIATA. *Expedition to the Khingan in 1891*. St Petersburg, 1893.—POTANIN. "Journey to the Khingan," in *Izvestia Russ. Geog. Soc.*, 1901. (P. A. K.)

Khingan, Little, a name indiscriminately applied to two distinct mountain ranges. The proper application of this name—if it be used at all—would be to reserve it for the typical mountain range which the Amur pierces for 40 miles below Ekaterino-Nikolsk, and which is also known as the Bureya mountains (*Bureinsky Khrebet* in Russian) and also Doussé-alin. This great range, which may be traced from the Amur to the Sea of Okhotsk, seems to be pierced twice by the Sungari and to be continued under different local names in the same south-westerly direction to the peninsula of Lao-tung (see MANCHURIA). However, the same name of Little Khingan was also often applied, during the war in Manchuria, to the Ilkhuri-alin mountains, which run in a north-westerly direction between the upper Nonni and the Amur, in the west of Blagovestchensk.

Khiva, formerly an important kingdom of central Asia, now a small khanate, vassal to Russia, and limited to the delta of the Amu-daria. Its frontier runs down the left bank of the Amu, from 40° 15' N., and down its left branch to Lake Aral; then, for about 40 miles along the south coast of Lake Aral to Cape Urgu, where it goes southwards, following the escarpment of the Ust-Urt. From the Transcaspian territory (Russia) Khiva is separated by a line running almost W.N.W.—E.S.E. under the 40° 30' parallel, from the Uzboi to the Amu-daria. The length of the khanate from north to south is 200 miles, and its greatest width 300 miles. The area of the Khiva oasis is 5210 square miles, while the area of the steppes is estimated at about 17,000 square miles. The population of the former is estimated at 300,000, and that of the latter at 400,000 (nomadic). The water of the Amu is brought by a number of large irrigation canals to the lands of the Khiva oasis, the general declivity of the soil westwards facilitating the irrigation. The chief of them are Pohlwan-ata (57 miles), beginning 8 miles below Pitnyak and passing by Khiva, Hazar-asp, Ishan, and Bagat; Kaz-abad (60 miles); Shah-abad (90 miles, 100 feet wide); Kilich-niaz-bai (64 miles); and Kara-göz (53 miles). Several old beds of the Amu intersect the territory. The water of the Amu and the very thin layer of fertile ooze which it deposits render the

oasis very fertile. Millet, rice, wheat, oats, peas, flax, hemp, madder, and all sorts of vegetables and fruit are grown, as also the vine and the cotton tree. The white-washed houses scattered amidst the elms and poplars and the fields produce the most agreeable impression on the traveller crossing the steppes. Cattle-breeding is carried on on a great scale by the nomads.

The population is composed of four nationalities: the Uzbegs (150,000 to 200,000), who are the dominating race among the settled inhabitants of the oasis, and from whom the officials are recruited; the Sarts and the Tajiks, who are the best agriculturists, and the tradespeople; the Turkomans, who live in the steppes, south and west of the oasis, and formerly plundered the settled inhabitants by their raids; and the Karakalpaks, or Black Bonnets, who were known to the Russian annalists as having helped the Russians against the Polovtsy, and probably are near of kin to the Pechenyegues, if not their direct descendants. They live in the south of Lake Aral, and in the towns—Kungrad, Hojeili, and Kipchak; they are the prevailing element. They cultivate the soil, breed cattle, and their women make carpets. There are also about 10,000 Kirghiz, and when the Russians took Khiva there were 29,291 Persian slaves, stolen by Turkoman raiders, and 6515 liberated slaves. The former were at once set free and the slave trade abolished. Of domestic industries, the embroidering of cloth, silks, and leather is worthy of notice. The trade of Khiva is rather considerable: cotton, wool, rough woollen cloth, and silk cocoons are exported to Russia, and various animal products to Bokhara. Cottons, velveteen, hardware, and pepper are imported from Russia, and silks, cotton, china, and tea from Bokhara. Khivan merchants habitually attend the Orenburg and Nijni-Novgorod fairs.

The khan of Khiva is a vassal of Russia, and is rapidly losing the last vestiges of his autonomy. He keeps about 2000 soldiers. The khanate, burdened since 1873 by a heavy war indemnity, which has never been paid, must gradually fall under the complete dominion of Russia. The capital is KHIVA, to the left of and 20 miles from the Amu-daria, 235 miles west of Bokhara. It is surrounded by a low earthen wall, and has a citadel, the residence of the khan and the higher officials. There are seventeen mosques built in brick, of which the one containing the tomb of Polvan is the best, and four large medresses (Mahommedan schools). Wide gardens are spread in the western part of the town. A small Russian quarter has also grown up. Population, about 12,000. The other towns are Hazar-asp, 50 miles south-east of Khiva, enclosed by high walls, with nearly 4000 inhabitants and a great number of shops; Shah-abad, where is situated the palace of the khan; Kunya Urghench (Old Urghench) on the Daria-lyk, 95 miles north-west of Khiva, devastated by Turkomans and now in ruins, and New Urghench (3000); Hojeili, opposite to Russian fort Nukus (8000); and Kungrad (7000, mostly in tents), 160 miles north-west of Khiva. (P. A. K.)

Khokand, a district town of Russian central Asia, province of Fergana, on the railway from Samarkand to Andijan, 85 miles west-south-west of the latter and 20 miles south of the Syr-daria; altitude, 1300 feet. It has a severe continental climate, the average temperatures being: Year, 56°; January 22°, July 65°. Yearly rainfall only 3·6 inches. It is the centre of a fertile irrigated oasis, and consists of a citadel, enclosed by a wall nearly 12 miles long, and of suburbs containing rich gardens. The town itself is a labyrinth of narrow and winding streets, and has fifteen medresses, many mosques, ten caravanserais, and an animated bazaar. The former palace of the khans, which recalls by its architecture the mosques of Samarkand, is the best building in the town. Khokand is now one of the chief centres of trade in Turkestan. Raw cotton and silk are the main items of export, while manufactured goods are imported from Russia and distributed from Khokand. Population (1897), 82,054.

The khanate of Khokand was a powerful state which grew up in the 18th century. Its early history is not yet well known, but it is certain that the town was founded in 1732 by Abdu-raim, under the name of Iski-kurgan, or Kali-i-Raïm-bai. This must relate, however, to the fort only, because the Arab travellers of the 10th century already mentioned Hovakend or Hokand, whose position has been identified with that of Khokand. Many other populous and wealthy towns are known to

have existed in this region at the time of the Arab conquest of Fergana. In the years 1758–59 the Chinese conquered Dzungaria and East Turkestan, and the beks of Fergana recognized Chinese suzerainty. In 1807 or 1808 Alim, son of Narbuta, succeeded in bringing all the beks of Fergana under his authority, and conquered Tashkend and Chimkent. However, his several attacks on the Bokharan fortress of Ura-tube were unsuccessful, and the country rose against Alim, who was killed in 1817 by the adherents of his brother Omar. Omar was a poet and encourager of learning, but continued also to enlarge his kingdom, taking the sacred town of Azret (Turkestan), and in order to protect the agricultural Fergana from the raids of the nomad Kirghiz, a series of fortresses was built on the Syr-daria, which became a basis for raids of the Khokand people into Kirghiz land. This was the origin of a conflict with Russia. A series of small wars was undertaken by the Russians after 1847 in order to destroy the Khokand forts, and to take possession, first, of the Ili and next of the Syr-daria region—the result being that in 1866, after the occupation of Ura-tube and Gizakh, the khanate of Khokand was separated from Bokhara. During the forty-five years after the death of Omar (he died in 1822) the khanate of Khokand was the seat of continuous internal wars, the essence of which was a struggle between the settled Sarts and the nomad Kipchaks, the two parties securing the upper hand in turns, and Khokand falling under the dominion or the suzerainty of Bokhara, which supported Khudoyar-Khan, the representative of the Kipchak party, in the years 1858–66; while Alim-kul, representative of the Sarts, stood at the head of the Gazawat (Holy War) proclaimed in 1860, and bravely fought against the Russians until he was killed at Tashkent in 1865. In 1868 Khudoyar-Khan, now separated from Bokhara, concluded a commercial treaty with the Russians, but was compelled to flee in 1875, when a new Holy War against Russia was proclaimed. It ended in the taking of the strong fort Mahram, the occupation of Khokand and Marghelan (1875), and the recognition of Russian superiority by the emir of Bokhara, Nasr-ed-din, who conceded to Russia all the territory to the north of the Naryn river. The war, however, broke out again next year, and ended, in February 1876, in the taking of Andijan and Khokand and the annexation of the Khokand khanate to Russia. The Fergana province was made out of it.

(P. A. K.)

Kholm (Polish *Chełm*), a district town of Russian Poland, government and 56 miles east-south-east of Lublin. It is a very old city, formerly the see of a bishop. It has now an archæological museum for church antiquities and a committee for the description of the churches of the Chelm-Warsaw bishopric. Population, 19,236.

Khorassan, one of the five great provinces of Persia. Its administrative divisions are: 1, Nishápúr; 2, Sabzvár; 3, Jovain and Asfaráin; 4, Bujnúrd; 5, Kúchán; 6, Derrehgez; 7, Kelát; 8, Chinárán; 9, Meshed; 10, Jám, Bákhaz, Rádkán; 11, Serrakhs; 12, Sarjám; 13, Bám and Safiábád; 14, Turbat i Haidari; 15, Turshíz; 16, Kháf; 17, Tún and Tabbas; 18, Káin; 19, Sístán. Until a few years ago the division of Nishápúr was under the governor-general of Khorassan, but it is now a separate province, with a governor appointed by the central

government at Tehran. The population is estimated at about a million, and its revenues (cash and kind) at £180,000 a year. About £40,000 of this amount is supposed to reach the Tehran treasury. The value of the exports and imports from and into the whole province for 1890-91 was estimated at £290,190 and £544,570. Later consular reports give figures for Meshed and northern Khorassan only:—

1891-92	.	Exports	£190,834	.	Imports	£357,758
1893-94	.	"	117,919	.	"	327,671
1897-98	.	"	136,543	.	"	290,440

The province produces 20,000,000 lb of wool. About a third of this quantity, valued at £50,000 to £60,000, is exported *via* Russia to the markets of western Europe, notably to Marseilles, Russia keeping only 200,000 to 300,000 lb. Other important articles of export, all to Russia, are cotton, carpets, shawls, and turquoises. With the exception of the agents of the Imperial Bank of Persia at Meshed, there was not in 1901 a single representative of British trade and commerce in the province, while Russian firms had agents, mostly Armenians, at all cities.

Khulna, a town and district of British India, in the Presidency division of Bengal. The town is on the river Bhairab; terminus of the Bengal Central railway, 109 miles east from Calcutta. Population (1891), 8667. Government high school, with 197 pupils in 1896-97. Khulna is the most important centre of river-borne trade in the delta. The district of KHULNA lies in the middle of the delta of the Ganges, including a portion of the Sundarbans or seaward fringe of swamps. It was formed out of Jessore in 1882. Area (excluding the Sundarbans), 2077 square miles; population (1881), 1,079,948; (1891), 1,177,652, showing an increase of 9 per cent.; average density, 567 persons per square mile. Classified according to religion, Hindus numbered 572,665; Mahomedans, 603,995; Christians, 963, of whom 17 were Europeans; "others," 29. In 1901 the population was 1,253,405, showing a further increase of 6 per cent. The land revenue and rates were Rs.7,46,595; number of police, 453; number of boys at school (1896-97), 28,954, being 31.2 per cent. of the male population of school-going age; registered death-rate (1897), 34.2 per thousand. There are twelve factories of sugar from the date-palm, with an out-turn valued at Rs.3,53,000. The district is entered by the Bengal Central railway, but by far the greater part of the traffic is still carried by water.

Khurja, a town of British India, in the Bulandshahr district of the North-West Provinces; 27 miles north-west of Aligarh, on the main line of the East Indian railway. Population (1891), 26,349; municipal income (1896-97), Rs.28,592. It is an important centre of trade, with a new Jain temple, many handsome public buildings, and a Victoria Jubilee school.

Khuzistan. See ARABISTAN.

Khyber. See KHAIBAR.

Kiaochow Bay, a large inlet on the south side of the promontory of Shantung, in China. It had no special importance until it was seized in November 1897 by the German fleet, in order to secure reparation for the murder of two German missionaries in the province of Shantung. In the course of the negotiations which followed, it was arranged that the bay and the land on both sides of the entrance within certain defined lines should be leased to Germany for 99 years. During the continuance of the lease Germany is to exercise all the rights of territorial sovereignty, including the right to erect fortifications. The size of the area leased is about 117 square miles, and a further area, comprising a zone of some 32 miles, measured

from any point on the shore of the bay, is reserved, within which the Chinese Government may not issue any ordinances without the consent of Germany. The native population in the ceded area is about 60,000. The German Government in 1899 declared Kiaochow a free port open to the commerce of all nations. By arrangement with the Chinese Government a branch of the imperial maritime customs has been established there for the collection of duties upon goods coming from or going to the interior, in accordance with the general treaty tariff. Trade centres at a small town named Tsingtao situated within the bay. The country in the neighbourhood is mountainous and bare, but the lowlands are well cultivated.

Kidderminster, a parish, municipal and parliamentary borough, and market town of Worcestershire, England, on the Stour, 14 miles north of Worcester by rail. The infirmary has been extended, a technical school erected, and a public recreation ground opened (1887). There is a free library. Area of municipal borough, 1213 acres. Population (1881), 24,270; (1901), 24,692.

Kieff, or KIEV, a government of Little Russia, in south-western Russia. It represents a deeply ravined plateau, from 600 to 800 feet in altitude, reaching 950 to 1050 feet in the west, taking a steppe character in the middle, and gently sloping northwards to the marshy regions of the Pripet, while on the east it falls abruptly to the valley of the Dnieper, which has only from 250 to 300 feet of altitude. General A. Tillo has shown that neither geologically nor tectonically can "spurs of the Carpathians" penetrate into Kieff. Many useful minerals are extracted, such as granites, gabbro, labradorites of a rare beauty, also syenites and gneiss, marble, grinding stones, pottery clay, phosphorites, iron ore, and mineral colours. The climate is more moderate than in middle Russia, the average temperatures at Kieff being—year, 44°; January, 21°; July, 68°; yearly rainfall, 21 inches. The lowlands of the north are covered with woods; they have the flora of the Polyessiye, and are peopled with animals belonging to higher latitudes. (Schmahlhäuser's *Flora of South-West Russia*, Kieff, 1886, contains a good description of the flora of the province.) The population, which was 2,017,262 in 1863, reached 3,576,125 in 1897; 1,791,503 were women, and 147,878 lived in towns. According to religion, there were (out of a total of 3,277,019), 2,738,977 Orthodox Greeks, 14,888 Nonconformists, 91,821 Catholics, 423,875 Jews, and 6820 Protestants.

No less than 41 per cent. of the land is in large holdings, 4 per cent. belongs to various institutions, 3 per cent. to the Crown, and 45 per cent. to the peasants. Out of an area of 11,819,000 acres, 11,085,000 acres are available for cultivation, 4,758,000 acres are under crops, 650,000 acres under meadows, and 1,880,000 acres under woods. About 290,000 acres are under beetroot, for sugar, giving a crop of 1,500,000 tons. The average crop of the various grains is 1,150,000 tons and 162,000 tons of potatoes, which affords an available surplus of 306,000 tons of grain and 24,000 tons of potatoes. There were in 1897, 368,455 horses, 608,400 horned cattle, 925,000 sheep, and 447,000 swine. Camels have been used for agricultural work. Bee-keeping and gardening are very general. The chief factories are sugar works (63) and distilleries. The former produce about 2,800,000 cwts. of sugar and over 1,000,000 cwts. of treacle. Every year 870,500 cwts. of sugar are refined. The distilleries (76) show yearly returns of about £1,100,000. The factories include machinery works, tanneries, steam flour-mills, naphtha-refineries, &c. The government is well provided with railways. Two main lines, starting from Kieff and Cherkasy respectively, cross it from north-east to south-west, and two lines cross its southern part from the north-west to the south-east, parallel to the Dnieper, with small side branches. Steamers ply on the Dnieper and some of its tributaries, and the shipping within the government shows a tonnage of 225,000 (£1,060,000). Wheat, rye, oats, barley, and flour are exported (210,000 tons in years of good crops). There are two great fairs, at Kieff and Berdicheff, and many of minor importance. Trade is very brisk. The government is better provided with schools than many other provinces of Russia. It is divided into twelve districts, the chief

towns of which are Kieff, Berdicheff (53,728 inhabitants), Cherkasy (29,619), Chighirin (9870), Kanev (8892), Lipovets (6068), Radomysl (11,154), Skvira (16,265), Tarascha (11,452), Umañ (28,628), Vasilkov (17,824), and Zvenigorodka (16,972). The plains on the Dnieper have been inhabited probably since the Palæolithic period, and the burial-grounds used since the Stone Age. The burial mounds (*kurghans*) both of the Scythians and the Slavonians, the traces of old forts (*gorodische*), the stone statues, and the more recent caves offer a rich material for anthropology and ethnography.

AUTHORITIES.—The *Archæological Map of the Government* by Professor ANTONOVITCH, 1887.—Count BOBRINSKY, *Kurghans of Smiela*, 1897. (Both contain bibliographical indications.)—N. BYELYASHEVSKY, *The Mints of Kieff*.—A. SELIVANOFF'S article in the *Russian Encycl. Dictionary*. The last two form valuable sources of information.

(P. A. K.)

Kieff, capital of the above government, situated on the right bank of the Dnieper (observatory—50° 27' 12" N., 30° 30' 18" E.; altitude, 594 feet; level of Dnieper, 288 feet); 626 miles by rail (*viâ* Kursk) south-west of Moscov, and 405 miles by rail north-east of Odessa. Population rapidly increasing: (1862) 70,341, (1874) 127,250, (1893) 193,150, (1897) 247,432. Kieff covers an area of about 13,500 acres, and has a circumference of 32 miles. Altogether it is one of the most beautifully built cities in Russia, while its neighbourhood is also picturesque. Electric and steam tramways have been built for a length of more than 25 miles, and a network of telephones has been established all over the city. Kieff is connected by rail with all the main cities of south-west Russia, as well as with Poland and Austria, the railway bridge across the Dnieper being the third largest in Russia. Steamers ply in summer to Kremenchug, Ekaterinoslav, Moghilev, Pinsk, and Chernigov. Its educational and scientific institutions are next to those of the two capitals. Its university has 2773 students (1897), and is well provided with observatories, laboratories, libraries, and museums; five scientific societies and two societies for aid to poor students are attached to it. There are besides a theological academy; a society of church archæology, which possesses a museum, very rich in old ikons, crosses, &c. (both Russian and Eastern); several lyceums for boys and high schools for girls; university courses for ladies; several technical schools both for boys and girls; a large polytechnic and numbers of primary schools. There are also many scientific, technical, musical, artistic, and social societies, ten libraries, three theatres, an opera house, and a considerable number of philanthropic institutions, hospitals, schools for medical help to children, &c.

Kieff is also an industrial city, and its 119 factories show yearly returns exceeding £1,000,000. It is the main centre for the sugar industry of Russia, as well as for the general trade of the region. Its Sryetenskaya fair, although showing small returns of goods brought in and sold, is an important centre for commercial transactions, which are estimated at more than £1,700,000 a year. Most interesting archæological finds have been made. More than twenty caves were discovered on the slope of a hill (Kirilloff Street), and one of them, excavated in 1876, proved to have belonged to Neolithic troglodytes. Numerous graves, both from the pagan and the Christian periods, the latter containing more than 2000 skeletons, with a great number of various small articles, were discovered in the same year in the same neighbourhood. Many colonial Roman coins from the 3rd to the 4th centuries, and silver *dirgems*, stamped at Samarkand, Balkh, Merv, &c., were also found in 1869.

The Russian literature concerning Kieff, its history and antiquities, is very voluminous. Its bibliography will be found in the *Russian Geographical Dictionary* of P. Semenov, and in the *Russian Encyclopædic Dictionary*, published by Brockhaus and Efron, vol. xv., 1895.

(P. A. K.)

Kiel, the chief naval port of Germany on the Baltic, Prussia, province of Schleswig-Holstein, at the head of Kiel Bay, 70 miles by rail north from Hamburg. Including the suburb of Wik, the town stretches along the west side of the harbour ($\frac{1}{4}$ to $4\frac{1}{4}$ miles in width and 11 miles long) as far as the entrance of the North Sea and Baltic

(Kaiser Wilhelm) Canal, a distance of $2\frac{3}{4}$ miles. The harbour has a general depth of at least 40 feet, and even close to the shore it is in many parts as deep as 20 feet. Its defences, which include a couple of forts on the west side and four on the east side, all situated about 5 miles from the head of the harbour, at a place where its shores approach one another, make it a place of great strategic strength. The imperial docks (five in all) and shipbuilding yards are on the east side between Gaarden and Ellerbeck; and in 1901 it was resolved to extend them still farther towards the north—that is, into the fishing village of Ellerbeck—by the construction of a spacious basin to accommodate the biggest warships. The imperial naval yard employs nearly 6500 hands, and another 5500 are employed in two large private shipbuilding works, both engaged principally in building warships, torpedo-boats, and docks. Each of the latter has constructed a new shipbuilding yard, and one of them (the Krupp Company) has also put up machinery works here. In 1901 the town authorities voted £55,000 for the construction of an outer commercial harbour at Wik, just south of the entrance into the North Sea and Baltic Canal. On the same shore of the harbour, between the old ducal castle and Wik, there stand several of the most important edifices in Kiel, namely, the university (attended by 780 students, with 100 professors in 1900–01), the imperial admiralty, and the naval academy. Kiel was in 1897 the scene of a memorable naval exhibition. The town and adjacent villages, *e.g.*, Wik, Heikendorf, Laboe, are resorted to for sea-bathing, and in June a famous regatta usually takes place. The waters of the harbour yield sprats (*Kieler Sprotten*), which are in much repute. Kiel is connected daily and nightly with Korsör in Denmark by express passenger boats. The church of St Nicholas was restored in 1877–84; the church of St James was built in 1886. Kiel possesses an art exhibition, a museum of antique sculptures, the Thaulow Museum (rich in Schleswig-Holstein wood-carving of the 16th and 17th centuries), the Schleswig-Holstein Museum of National Antiquities (in the old university buildings), a university infirmary, zoological and mineralogical museums, a botanical garden, and a school of forestry; also monuments to the Emperor William I. (1896), Bismarck (1897), Duke Frederick William of Mecklenburg (1898), and Löwe (1896), the composer. In addition to the naval academy, the imperial naval institutions include a naval school, a school for petty officers, engineers' school, and seamen's school; there are further an agricultural college, attached to the university, and technical, commercial, and music schools. The principal industries are those connected with the imperial navy and shipbuilding, but embrace also flour-mills, oil-mills, iron-foundries, printing-works, breweries, brick-works, fish-curing, &c. Kiel owns a mercantile fleet of about 100 vessels, measuring about 25,000 tons. There is an important trade in coal, timber, cereals, fish, butter, and cheese. The port is entered annually by over 3000 vessels of about 515,000 tons. Population (1885), 51,706; (1890), 69,172; (1900), 107,938; or including Gaarden, which was united with Kiel on 1st April 1901, 121,761.

(J. T. BE.)

Kielce, a government in the south-west of Russian Poland. Its surface is an elevated plateau from 800 to 1000 feet in altitude, intersected in the north-east by a range of hills reaching 1350 feet and deeply ravined in the south. It is watered by the Vistula on its south-east border, and its tributaries, Nida and Pilica, which have a very rapid fall and occasion inundations. Silurian and Devonian quartzites, dolomite, limestones, and sandstones prevail in the north, and contain rich iron ores, which are worked to a considerable extent, as well as lead and copper ores. Carboniferous deposits containing rich coal seams occur

chiefly in the south, and spread to Piotrków; Permian limestones and sandstones are found in the south. The Trias deposits contain very rich zinc ores of considerable thickness, and lead. The Jurassic deposits consist of iron-clays and limestones, in which large caves are found near Oiców. The Cretaceous deposits contain, besides gypsum and chalk, sulphur (the richest near Czarkowa). White and black marble are also extracted. The soil is of great variety and fertile in parts, but owing to the proximity of the Carpathians, &c., the climate is more severe than might have been expected. Rye, wheat, oats, barley, and sarrazin are grown; modern intensive culture is spreading, and land fetches high prices, the more so as the peasants' allotments were small at the outset and are steadily decreasing. In 1893 there were 106,608 horses, 243,784 horned cattle, and 131,944 sheep. Grain is exported. Industries are widely developed: 54,400 tons of zinc ores are extracted, and 1000 tons of iron are obtained. The factories employ nearly 5000 persons, and show a yearly return of about £500,000. Tiles, metallic goods, leather, timber goods, and flour are their chief products. Kielce is divided into seven districts, the chief towns of which are Kielce, Jędrzejów (Russian, *Andreyev*, 5010), Miechów (4156), Olkusz (3491), Pinczów (8095), Stopnica (4659), and Włoszczowa (23,065).

Kielce, capital of the above government, 107 miles by rail south of Warsaw, *viâ* the Ivangorod junction, and 103 miles from Dombrovo on the Austrian frontier. It is situated in a picturesque hilly country. It has an old castle, which was built in 1638 and for some time was inhabited by Charles XII., and which was renowned for its portrait gallery and the library of Zaluski, which was taken to St Petersburg. The lyceum for boys has a good library and museum. The squares and boulevards of the town are well kept, and adorned with several handsome modern buildings. The aggregate yearly returns of several factories (hemp-spinning, cotton-printing, cement works) attain £100,000. Population (1890), 12,775; (1897), 23,189.

Kilbarchan, a burgh of barony of Renfrewshire, Scotland, 12 miles west by south of Glasgow. It has stations on two sections of the Glasgow and South-Western railway. Silk and cotton manufactures are carried on, and the parish contains coal and iron mines, and quarries. Water is supplied, and there are two libraries and a public park. The churches are Established and United Free, and the public school had in 1898-99 an average attendance of 453. Population (1881), 2548; (1901), 2886.

Kildare, an inland county of Ireland, province of Leinster, bounded on the N. by Meath, on the E. by Dublin and Wicklow, on the S. by Carlow, and on the W. by Queen's county and King's county.

The area of the administrative county in 1900 was 418,496 acres, of which 101,628 were tillage, 260,290 pasture, 199 fallow, 6288 plantation, 30,581 turf bog, 2891 marsh, 1474 barren mountain, and 15,145 water, roads, fences, &c. The new administrative county under the Local Government (Ireland) Act, 1898, is identical with the old judicial county. The population in 1881 was 75,804, and in 1891, 70,206, of whom 38,407 were males and 31,799 females, divided as follows among the different religions: Roman Catholics, 59,034; Protestant Episcopalians, 9096; Presbyterians, 1310; Methodists, 573; and other denominations, 193. The decrease of population between 1881 and 1891 was 7.38 per cent. The average number of persons to an acre was .17. Of the total population, 58,378 persons inhabited the rural districts, being an average of 107 persons to each square mile under crops and pasture. The population in 1901 was 63,469 (Roman Catholics, 54,794; Protestant Episcopalians, 7454; Presbyterians, 666; Methodists, 383; others, 172), being a decrease of 9.6 per cent. The following table gives the degree of education in 1891:—

	Males.	Females.	Total.	Percentage.			
				R. C.	Pr. Ep.	Presb.	Meth.
Read and write	27,052	21,298	48,350	72.0	94.9	96.3	98.7
Read only	3,315	3,175	6,490	11.7	2.3	2.5	.4
Illiterate	4,783	4,209	8,992	16.3	2.8	1.2	.9

The percentage of illiterates among Roman Catholics in 1881 was 22.6. In 1891 there were 6 superior schools with 880 pupils (Roman Catholics, 873, and Protestants, 7), and 139 primary schools with 8877 pupils (Roman Catholics, 7767, and Protestants, 1110). The number of pupils on the rolls of the national schools on 30th September 1899 was 8873, of whom 8192 were Roman Catholics and 681 Protestants.

The following table gives the number of births, deaths, and marriages in different years:—

Year.	Births.	Deaths.	Marriages.
1881	1861	1363	351
1891	1541	1172	298
1900	1342	1310	315

In 1900 the birth-rate per thousand was 21.1, and the death-rate 20.6; the rate of illegitimacy was 1.8 per cent. of the total births. The total number of emigrants who left the county between 1st May 1851 and 31st December 1899 was 35,748, of whom 19,729 were males and 16,019 females. The chief towns in the county, with their populations in 1891, are Athy, 4886; Naas, 3774; Newbridge, 3318.

Administration.—The county is divided into two parliamentary divisions, North and South; the number of registered electors in 1900 being respectively 6541 and 7573. The rateable value in 1900 was £362,276. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises two urban and five rural sanitary districts.

Agriculture.—The following tables show the acreage under crops, including meadow and clover, and the amount of live stock in 1881, 1891, 1895, and 1900:—

Year.	Wheat.	Oats.	Barley, Rye, &c.	Potatoes.	Turnips.	Other Green Crops.	Meadow and Clover.	Total.
1881	4125	24,206	13,791	9346	11,518	2590	55,389	120,960
1891	1365	20,440	12,769	7559	10,563	2162	51,473	106,631
1895	485	21,502	11,509	7341	10,732	2310	57,536	110,365
1900	776	17,656	12,292	6390	9,687	2051	52,776	101,628

In 1899 the total value of the cereal and other crops was estimated by the Registrar-General at £630,198. The number of acres under pasture in 1881 was 235,061; in 1891, 249,934; and in 1900, 260,290:—

Year.	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1881	14,345	4155	92,249	117,770	12,936	3835	224,310
1891	14,320	4188	97,530	176,369	14,942	3991	209,263
1895	16,019	4235	92,553	126,881	13,753	3969	222,558
1900	13,239	4252	104,077	155,157	11,902	2810	243,050

The number of milch cows in 1891 was 14,050, and in 1900 12,281. It is estimated that the total value of cattle, sheep, and pigs in 1899 was £1,659,118. In 1900 the number of holdings not exceeding 1 acre was 1814; between 1 and 5, 1604; between 5 and 15, 1658; between 15 and 30, 1134; between 30 and 50, 821; between 50 and 100, 966; between 100 and 200, 721; between 200 and 500, 361; and above 500, 43—total, 9122. The number of loans issued (the number of loans being the same as the number of tenants) under the Land Purchase Acts, 1885, 1891, and 1896, up to 31st March 1900 was 697, amounting to £541,367. The number of loans for agricultural improvements sanctioned under sect. 31 of the Land Act, 1881, between 1882 and 1900 was 219, and the amount issued was £25,584. The total amount issued on loan for all classes of works under the Land Improvement Acts from the commencement of operations in 1847 to 31st March 1900 was £146,252.

(W. H. Po.)

Kilia, a town and custom-house of Russia, government of Bessarabia, district Ismail, 100 miles south-west of Odessa, on the Kilia branch of the Danube. It has steam flour-mills and a rapidly increasing trade. Population, 11,703.

Kilimanjaro, a great mountain in East Africa, its centre lying in 3° 5' S. and 37° 23' E. It is the highest known summit of the continent, rising as an isolated volcanic cone from a plateau of about 3000 feet to 19,700 feet at its highest point. The major axis of the mountain runs almost east and west, and on it rise the two principal summits, Kibo in the west, Mawenzi in the east. Kibo, the higher, is a truncated cone with a nearly perfect extinct crater, and marks a comparatively recent period of volcanic activity; while Mawenzi (17,050 feet) is the very ancient core of a former summit, of which the crater walls have been removed by denudation. The two peaks, which are about 7 miles apart, are connected by a saddle or plateau, about 14,000 feet in altitude, below which the vast mass slopes with great regularity in a typical volcanic curve, especially in the south, to the plains below. The sides are furrowed on the south and east by a large number of narrow ravines, down which flow streams which feed the Pangani and Lake Jipe in the south and the Tzavo tributary of the Tana in the east. South-west of Kibo, the Shira ridge seems to be of independent origin, while in the north-west a rugged group of cones, of comparatively recent origin, has poured forth vast lava-flows. In the south-east the regularity of the outline is likewise broken by a ridge running down from Mawenzi. The lava slopes of the Kibo peak are covered to a depth of some 200 feet with an ice-cap, which, where ravines occur, takes the form of genuine glaciers. The crater walls are highest on the south, three small peaks, uncovered by ice, rising from the rim on this side. To the central and highest of these, the culminating point of the mountain, the name Kaiser Wilhelm Spitze has been given. The rim here sinks precipitously some 600 feet to the interior of the crater, which measures rather over 2000 yards in diameter, and is in part covered by ice, in part by a bare cone of ashes. On the west the rim is breached, allowing the passage of an important glacier formed from the snow which falls within the crater. Lower down this cleft, which owed its origin to dislocation, is occupied by two glaciers, one of which reaches a lower level (13,800 feet) than any other on Kilimanjaro. On the north-west three large glaciers reach down to 16,000 feet. Mawenzi peak has no permanent ice-cap, though at times snow lies in patches. The rock of which it is composed has become very jagged by denudation, forming stupendous walls and precipices. On the east the peak falls with great abruptness some 6500 feet to a vast ravine, due apparently to dislocation and sinking of the ground. Below this the slope is more gradual and more symmetrical. Like the other high mountains of eastern Africa, Kilimanjaro presents well-defined zones of vegetation. The lowest slopes are arid and scantily covered with scrub, but higher up, between 4000 and 6000 feet on the south side of the mountain, are well watered and cultivated. The forest zone begins, on the south, at about 6500 feet, and extends to 9500, but in the north it is narrower, and in the north-west, which is the driest quarter of the mountain, almost disappears. In the alpine zone, marked especially by tree lobelias and *Senecio*, flowering plants extend up to 15,700 feet on the sheltered south-west flank of Mawenzi, but elsewhere vegetation grows only in dwarfed patches beyond 13,000 feet. The special fauna and flora of the upper zone are akin to those of other high African mountains, including Cameroon. The southern slopes, between 4000 and 6000 feet, form the well-peopled country of Chagga, divided up into small districts. The best known of these is Moshi, where a German station has been established for some years. Kilimanjaro, first seen by the German Rebmann in 1849, and since visited by von der Decken, New, Thomson, Johnston, and others,

has been the special study of Dr Hans Meyer, who made four expeditions to it, accomplishing the first ascent to the summit in 1889.

See especially JOHNSTON. *The Kilimanjaro Expedition*. London, 1886.—MEYER. *Across East African Glaciers*. London, 1891; *Der Kilimanjaro*. Berlin, 1900. (E. HE.)

Kilindria, the ancient *Kelenderis*, a small town on the south coast of Asia Minor. After having been almost deserted, it has rapidly revived under the influence of trade with Cyprus since the British occupation.

Kilkenny, an inland county of Ireland, province of Leinster, bounded on the N. by Queen's county, on the E. by Carlow and Wexford, on the S. by Waterford, and on the W. by Tipperary.

The area of the administrative county in 1900 was 509,245 acres, of which 140,216 were tillage, 313,021 pasture, 417 fallow, 9963 plantation, 2539 turf bog, 5125 marsh, 13,537 barren mountain, and 24,427 water, roads, fences, &c. The new administrative county under the Local Government (Ireland) Act, 1898, includes the county of the city of Kilkenny and one electoral division formerly situated in Waterford, but does not include the portion of the town of New Ross formerly situated in Kilkenny. The population in 1881 was 99,531, and in 1891, 87,496. The decrease of population between 1881 and 1891 was 12·33 per cent. The average number of persons to an acre for the whole county was ·17. Of the total population 75,928 persons inhabited the rural districts, being an average of 109 persons to each square mile under crops and pasture. The population in 1901 was 78,821, of whom 39,933 were males and 38,888 females (Roman Catholics, 74,572; Protestant Episcopalians, 3930; Presbyterians, 141; Methodists, 116; others, 62), being a decrease of 9·9 per cent. The following table gives the degree of education in 1891 (excluding the city of Kilkenny) :—

	Males.	Females.	Total.	Percentage.			
				R.C.	Pr.Ep.	Presb.	Meth.
Read and write	26,083	24,923	51,006	72·6	90·7	97·0	94·4
Read only	3,341	4,166	7,507	11·1	4·8	1·0	2·8
Illiterate	5,209	5,734	10,943	16·3	4·5	2·0	2·8

The percentage of illiterates among Roman Catholics in 1881 was 22·9. In 1891 (including the city of Kilkenny) there were 9 superior schools with 414 pupils (Roman Catholics, 338; Protestants, 76), and 211 primary schools with 14,901 pupils (Roman Catholics, 14,246; Protestants, 655). The total number of pupils on the rolls of the national schools on 30th September 1899 was 13,912, of whom 13,380 were Roman Catholics and 532 Protestants.

The following table gives the number of births, deaths, and marriages in various years :—

Year.	Births.	Deaths.	Marriages.
1881	1957	1722	333
1891	1770	1563	409
1900	1602	1619	283

The birth-rate per thousand in 1900 was 20·3, and the death-rate 20·5; the rate of illegitimacy was 2·3 per cent. of the total births. The total number of emigrants who left the county between 1st May 1851 and 31st December 1899 was 73,023, of whom 37,734 were males and 35,289 females. The chief towns in the county, with their populations in 1891, are Kilkenny, 11,048 (1901, 10,493); Cullin, 1973; Castlecomer, 1019.

Administration.—The county is divided into two parliamentary divisions, North and South, the number of registered electors in 1900 being respectively 6170 and 5141. The rateable value in 1900 was £334,919. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises one urban and eight rural sanitary districts.

Agriculture.—The accompanying tables show the acreage under crops, including meadow and clover, and the amount of live stock

Year.	Wheat.	Oats.	Barley, Rye, &c.	Potatoes.	Turnips.	Other Green Crops.	Meadow and Clover.	Total.
1881	11,843	35,873	17,511	18,258	9,943	3794	62,077	159,304
1891	5,197	30,612	16,517	15,616	9,586	4053	61,207	142,758
1895	1,156	32,749	18,037	14,813	10,569	3826	65,055	146,506
1900	2,167	27,680	19,597	13,186	10,629	4432	62,275	140,216

in 1881, 1891, 1895, and 1900. The figures for 1900 are for the new administrative county.

In 1899 the total value of the cereal and other crops was estimated by the Registrar-General at £945,746. The number of acres under pasture in 1881 was 290,470, in 1891, 304,873, and in 1900, 313,021.

Year.	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1881	17,987	5845	120,604	85,898	39,777	6176	410,484
1891	20,529	5893	129,066	121,520	44,791	8619	449,113
1895	21,747	5801	125,815	105,080	39,114	7388	439,160
1900	19,962	6381	138,866	102,288	35,636	6438	514,061

The number of milch cows in 1891 was 37,106, and in 1900, 38,093. It is estimated that the total value of cattle, sheep, and pigs in 1899 was £1,894,077. In 1900 the number of holdings not exceeding one acre was 1974; between 1 and 5, 1684; between 5 and 15, 2492; between 15 and 30, 2460; between 30 and 50, 2171; between 50 and 100, 2115; between 100 and 200, 806; between 200 and 500, 210; and above 500, 21—total, 13,933. The number of loans issued (the number of loans being the same as the number of tenants) under the Land Purchase Acts, 1885, 1891, and 1896, up to 31st March 1900, was 1155, amounting to £588,502. The number of loans for agricultural improvements sanctioned under sect. 31 of the Land Act, 1881, between 1882 and 1900 was 287, and the amount issued was £19,201. The total amount issued on loan for all classes of works under the Land Improvement Acts from the commencement of operations in 1847 to 31st March 1900 was £76,825.

(W. H. Po.)

Kilkenny, an inland city and parliamentary borough, capital of the above county, on the river Nore, 73 miles south-west of Dublin by rail. Under the Local Government (Ireland) Act, 1898, it retains its mayor and corporation, which, however, has now practically the status of an urban district council. The manufacture of blankets, coarse woollens, and linens has declined. The municipal borough comprises 921 acres. Population (1881), 12,182; (1891), 11,048; (1901), 10,493.

Kilmarnock, a parliamentary burgh and important railway centre (Kilmarnock group) of Ayrshire, Scotland, on Kilmarnock water, 24 miles south-west of Glasgow by rail. The engineering and iron trades have displaced carpet-weaving as the staple industry, though tweed-making has been added to the other woollens; the workshops of the Glasgow and South-Western railway are situated here, and hydraulic machinery is a speciality of the town. A large cotton factory and another for the making of lace curtains are among the industrial features. The grounds of Kilmarnock House were presented to the town in 1893, and have been laid out as a public park. Eight acres have been added to Kay Park, where a Reformers' Monument was unveiled in 1885. The town hall has been renovated, and recent erections include a new academy, a corporation art gallery, and a spacious institute containing a free library and a museum. The academy is under the School Board. Population (1881), 23,901; (1901), 34,161.

Kilsyth, a police burgh and burgh of barony of Stirlingshire, Scotland, 13 miles north-east of Glasgow by rail. The Forth and Clyde Canal passes near the straggling town. The quarrying of whinstone, which abounds in the neighbourhood, is carried on to a considerable extent. Recent erections are United Free and Wesleyan churches, and a public school, besides which there is a large academy with an elementary department. Population (1881), 5402; (1901), 7331.

Kimberley, John Wodehouse, 1st EARL (1826–1902), English statesman, was born 7th January 1826, being the eldest son of the Hon. Henry Wodehouse and grandson of the 2nd Baron Wodehouse, whom he succeeded in 1846. He was educated at Eton and Christ Church, Oxford, where he took a first-class degree in classics in 1847; in the same year the new Lord Wodehouse married Lady Florence FitzGibbon (d. 1895),

daughter of the last earl of Clare. He was by inheritance a Liberal in politics, and in 1852–56 and 1859–61 he was Under Secretary of State for Foreign Affairs in Lord Aberdeen's and Lord Palmerston's ministries. In the interval (1856–58) he had been envoy-extraordinary to Russia; and in 1863 he was sent on a special mission to Copenhagen on the forlorn hope of finding a peaceful solution of the Schleswig-Holstein question. The mission was a failure, but probably nothing else was possible. In 1864 he became Under Secretary for India, but towards the end of the year was made Lord-Lieutenant of Ireland. In that capacity he had to grapple with the first manifestations of Fenianism, and in recognition of his vigour and success he was created (1866) earl of Kimberley. In July 1866 he vacated his office with the fall of Lord Russell's ministry, but in 1868 he became Lord Privy Seal in Mr Gladstone's cabinet, and in July 1870 was transferred from that post to be Secretary of State for the Colonies. It was the moment of the great diamond discoveries in South Africa, and the new town of Kimberley was named after the Colonial Secretary of the day. After an interval of Opposition from 1874 to 1880, Lord Kimberley returned to the Colonial Office in Mr Gladstone's next ministry; but at the end of 1882 he exchanged this office first for that of Chancellor of the Duchy of Lancaster and then for the Secretaryship of State for India, a post which he retained during the remainder of Mr Gladstone's tenure of power (1882–86, 1892–94), though in 1892–94 he combined with it that of the Lord Presidency of the Council. In Lord Rosebery's cabinet (1894–95) he was Foreign Secretary. Lord Kimberley was an admirable departmental chief, but it is difficult to associate his own personality with any ministerial act during his occupation of all these posts. He was at the Colonial Office when responsible government was granted to Cape Colony, when British Columbia was added to the Dominion of Canada, and during the Boer war of 1880–1881, with its conclusion at Majuba; and he was Foreign Secretary when the misunderstanding arose with Germany over the proposed lease of territory from the Congo Free State for the Cape to Cairo route. He was essentially a loyal Gladstonian party man. His moderation, common-sense, and patriotism had their influence, nevertheless, on the policy from time to time agreed upon in concert with his colleagues. As leader of the Liberal party in the House of Lords he acted with undeviating dignity; and in Opposition he was a courteous antagonist and a critic of weight and experience. He took considerable interest in education, and after being for many years a member of the senate of London University, he became its chancellor in 1899. He died in London, 8th April 1902, being succeeded in the earldom by his eldest and only surviving son, Lord Wodehouse (b. 1848). After Mr Gladstone's retirement from politics, the value of Lord Kimberley's moderating influence on the counsels of his party became more than ever marked, owing to the dissensions which hampered its activity. He took sides with no section, but did his best to keep the party together. It was this element in his character, rather than any special ability, which made him a notable personality in English politics.

(H. CH.)

Kimberley, a town of Cape Colony, centre of the Griqualand West diamond industry. Next to Cape Town and Johannesburg, it is the largest place in South Africa, with a population which rose from about 20,000 in 1881 to 28,718 in 1891. It lies on the main railway running from the Cape towards the Zambezi, about midway between Cape Town and Bulawayo, being 646 miles distant from the former and 714 from the latter place. The mine

which gives its name to the town is one of the great "pipes," as they are called—Kimberley, De Beers, Du Toit's Pan, and Bulfontein—which are clustered together on the plateau near the converging frontiers of Cape Colony, the Orange River Colony, and Transvaal, and have collectively for some years controlled and supplied the diamond markets of the world. The pipes are natural "chimneys," perhaps extinct craters, which were at first supposed to taper downwards, but are now known to broaden out to depths of over 2000 feet, penetrating through limestones, diorites, porphyries, basalts, and other formations down to the granite and gneiss bed-rocks. The diamonds occur in the yellow, and lower down in the blue eruptive matter which fills the pipes and was probably forced up by the pressure of underground forces. The supply appears to be practically unlimited, but is regulated by the De Beers corporation, which has bought up all minor claims, and is thus able to control the market. Since 1895 the annual output has averaged over £4,500,000 (£4,567,000 in 1898), and the total value of diamonds exported between the years 1867 and 1898 was estimated at £87,878,000. On the outbreak of hostilities in 1899 the Boers laid siege to Kimberley, and held it closely invested from 12th October of that year till 15th February 1900, when it was relieved by General Sir John French.

Kincardineshire, or **THE MEARNS**, a maritime county of east Scotland, is bounded on the E. by the German Ocean, on the N.W. by Aberdeenshire, and on the S.W. by Forfarshire.

Area and Population.—In 1891 alterations were made in the boundary between Kincardineshire and Aberdeenshire in the parishes of Banchory-Ternan and Drumoak, the first being placed wholly in Kincardine, and the second in Aberdeen. The area of the county (foreshore excluded) is 245,259 acres, or 383·2 square miles. The population was in 1881, 34,464; in 1891, 35,647; in 1891, on the above area, 35,492; in 1901, 40,918, of whom 20,067 were males and 20,851 females. On the old area, taking land only (245,347 acres, or 383·3 square miles), the number of persons to the square mile in 1891 was 93, and the number of acres to the person 6·9. In the registration county the population increased between 1881 and 1891 by 3·4 per cent. Between 1881 and 1891 the excess of births over deaths was 6444, and the increase of the resident population 1197. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate.
1880	542	204	1073	11·9
1890	556	154	1055	13·08
1899	642	201	1202	10·6

The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881-90.	1890.	1891-98.	1899.
Birth-rate . . .	30·25	30·00	28·58	29·27	32·76
Death-rate . . .	15·29	14·98	15·06	14·87	17·64
Marriage-rate . .	5·75	5·15	4·17	5·57	5·52

There were 116 Gaelic-speaking persons in the county in 1891, and 14 foreigners. Valuation in 1889-90, £251,889; 1899-1900, £246,819.

Administration.—The county returns a member to Parliament. Bervie (2523) is the only royal burgh, and is one of the Montrose group of parliamentary burghs. Stonehaven (4565), the county town, is a police burgh. There are 19 civil parishes, with a combination poorhouse at Stonehaven, and the number of paupers and dependants in September 1899 was 567. Kincardine is united in one sheriffdom with Aberdeen and Banff shires, and one of the Aberdeen sheriffs-substitute sits at Stonehaven.

Education.—Nineteen school boards manage 48 schools, which had an average attendance of 5402 in 1898-99, while 8 voluntary schools, of which 4 are Episcopal, had 433. There is an academy at Stonehaven, and three other public schools earned grants in 1898 for giving higher education. The county council hands over the "residue" grant to the county secondary education committee,

which expends it in technical education grants to a number of schools and school boards. At Blairs, near the Dee in the north-east corner of the county, is a Roman Catholic college at which young men are trained for the priesthood by a rector, and four clerical and three lay professors.

Agriculture.—Oats are the principal corn crop, although the acreage has declined of late years with the increase of the barley acreage due to the demands of distilling. Cattle are bred, but the bulk of the stock is kept for feeding. The percentage of cultivated area in 1898 was 49·2; and in 1895, 25,795 acres were under wood, of which 1586 had been planted since 1881. The average size of the 1698 holdings in 1895 was 71 acres. The percentage under 5 acres was 12·43; between 5 and 50 acres, 42·34; and over 50 acres, 45·23. The number between 50 and 100 acres was 336; between 100 and 300, 389; between 300 and 500, 36; and over 500, only 7. The following table gives the principal acreages at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	120,322	44,936	22,602	46,134	6,448	141
1885	121,496	44,373	21,675	46,674	8,704	68
1890	122,848	43,465	21,420	47,427	10,281	148
1895	120,993	42,647	21,073	48,528	8,611	54
1899	120,685	44,446	21,159	48,257	8,742	2

The following table gives particulars of the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	4903	25,207	6736	32,308	2196
1885	4651	25,922	7032	29,987	2894
1890	4733	26,627	7358	39,437	3138
1895	5433	26,133	6918	37,535	2680
1899	5009	25,752	6970	44,483	2544

At the census of 1891, 4685 men and 164 women were returned as being engaged in agriculture.

Industries and Trade.—Apart from agriculture the principal industry is fishing. Stonehaven is the centre of a fishery district which is not exactly continuous with the county. The following table gives particulars of the district:—

Year.	Boats.		Value.	Value of Gear.	Resident Fishermen and Boys.	Total Value of all Fish.
	No.	Tons.				
1880	230	1864	£2119	£12,500	517	£26,608
1890	165	1714	£8673	£10,391	403	£18,264
1899	153	1538	£8067	£10,863	377	£19,565

In 1898, 783 persons were engaged in the district in connexion with the various branches of the sea fisheries. Persons connected with industry numbered 4130 in 1891.

Kinglake, Alexander William (1809-1891), English historian and traveller, was born at Taunton 5th August 1809. His father was a respected and successful solicitor, and intended his son for a legal career. Kinglake went to Eton and Trinity College, Cambridge, where he matriculated in 1828, being a contemporary and friend of Tennyson and Thackeray. He took his B.A. degree in 1832, and his M.A. in 1836. After leaving Cambridge he joined Lincoln's Inn, and was called to the bar in 1837. While still a student he travelled, in 1835, throughout the East, and the impression made upon him by his experiences was so powerful that he was seized with the desire to record them in literature. The task, however, proved difficult to his fastidious taste, and he was engaged for seven years in elaborating his manuscript, which he actually rewrote three times. *Easton*, a sensitive and witty record of impressions keenly felt and remembered, was published in 1844, and enjoyed considerable reputation. In 1854

he went to the Crimea, and was present at the battle of the Alma. During the campaign he made the acquaintance of Lord Raglan, who was so much attracted by his talents that he suggested to Kinglake the plan for an elaborate *History of the Crimean War*, and placed his private papers at the writer's disposal. For the rest of his life Kinglake was engaged upon the task of completing this monumental history. Thirty-two years elapsed between its commencement and the publication of the last volume, and eight volumes in all appeared at intervals between 1863 and 1887. During the course of its composition Kinglake lived principally in London, and sat in Parliament for Bridgwater from 1857 until the disfranchisement of the borough in 1868. He died 2nd January 1891, in his eighty-second year. Kinglake's life-work, *The History of the Crimean War*, is in scheme and execution too minute and conscientious to be altogether in proportion, but it is a wonderful example of painstaking and talented industry. It is not without errors of partisanship, and its criticisms and eulogies cannot always be accepted. But it shows remarkable skill in the moulding of vast masses of despatches and technical details into an absorbingly interesting narrative; it is illumined by natural descriptions and character-sketches of great fidelity and acumen; and, despite its length, it remains one of the most picturesque, most vivid, and most actual pieces of historical narrative in the English language.

(A. W.A.)

King's County, an inland county of Ireland, province of Leinster, bounded on the N. by Westmeath, on the E. by Kildare, on the S. by Queen's county, and on the W. by the Shannon.

The area of the administrative county in 1900 was 493,263 acres, of which 108,647 were tillage, 239,858 pasture, 400 fallow, 6870 plantation, 96,129 turf bog, 14,744 marsh, 5752 barren mountain, 20,833 water, roads, fences, &c. The new administrative county under the Local Government (Ireland) Act, 1898, is identical with the old judicial county. The population in 1881 was 72,852, and in 1891, 65,563, of whom 33,777 were males and 31,786 females, divided as follows among the different religions: Roman Catholics, 58,264; Protestant Episcopalians, 6432; Methodists, 463; Presbyterians, 291; and other denominations, 113. The decrease in population between 1881 and 1891 was 10·1 per cent. The average number of persons to an acre was '13. Of the total population, 55,988 persons inhabited the rural districts, being an average of 104 persons to each square mile under crops and pasture. The population in 1901 was 60,129 (Roman Catholics, 53,778; Protestant Episcopalians, 5520; Methodists, 363; Presbyterians, 328; others, 140), being a decrease of 8·3 per cent. The following table gives the degree of education in 1891:—

	Males.	Females.	Total.	Percentage.			
				R.C.	Pr.Ep.	Presb.	Meth.
Read and write	21,975	20,430	42,405	68·7	92·4	93·0	94·6
Read only	3,449	3,784	7,233	13·3	3·6	3·9	3·3
Illiterate	5,190	4,557	9,747	18·0	4·0	3·1	2·1

The percentage of illiterates among Roman Catholics in 1881 was 24·2. In 1891 there were 6 superior schools with 131 pupils (Roman Catholics 97, and Protestants 34), and 135 primary schools with 9285 pupils (Roman Catholics 8317, and Protestants 968). The number of pupils on the rolls of the national schools on 30th September 1899 was 10,209, of whom 9429 were Roman Catholics and 780 Protestants.

The following table gives the number of births, deaths, and marriages in various years:—

Year.	Births.	Deaths.	Marriages.
1881	1683	1234	287
1891	1404	1081	257
1900	1175	1175	257

In 1900 the birth-rate per thousand was 19·5, and the death-rate 19·5; the rate of illegitimacy was 1·7 per cent. of the total births. The total number of emigrants who left the county between 1st May 1857 and 31st December 1899 was 57,765, of whom 29,697 were males and 28,068 females. The chief towns in the county are: Tullamore (4639 in 1901); Parsonstown, 4438; Edenderry, 1611.

Administration.—The county is divided into two parliamentary divisions, Birr and Tullamore, the number of registered electors in 1900 being respectively 4792 and 4939. The rateable value in 1900 was £246,251. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises two urban and five rural sanitary districts.

Agriculture.—The following table gives the acreage under crops, including meadow and clover, and the amount of live stock in 1881, 1891, 1895, and 1900:—

Year.	Wheat.	Oats.	Barley, Rye, &c.	Potatoes.	Turnips.	Other Green Crops.	Meadow and Clover.	Total.
1881	1497	23,082	15,746	15,753	9,862	3564	50,308	119,752
1891	317	19,898	19,168	14,411	10,326	3464	46,255	113,839
1895	119	21,210	16,761	13,652	10,424	3908	50,265	116,334
1900	352	18,620	15,394	12,645	9,320	3835	48,451	108,647

For 1899 the total value of the cereal and other crops was estimated by the Registrar-General at £744,238. The number of acres under pasture in 1881 was 231,744; in 1891, 232,780; and in 1900, 239,858.

Year.	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1881	14,714	6221	68,165	97,570	20,526	3910	271,879
1891	16,233	6850	79,136	124,264	28,354	6307	300,588
1895	16,631	6735	74,158	96,516	24,589	5712	282,856
1900	14,572	7231	82,273	101,730	26,746	5200	306,961

The number of milch cows in 1891 was 16,534, and in 1900, 15,569. It is estimated that the total value of cattle, sheep, and pigs for 1899 was £1,278,869. In 1900 the number of holdings not exceeding 1 acre was 1892; between 1 and 5, 1620; between 5 and 15, 2285; between 15 and 30, 2074; between 30 and 50, 1336; between 50 and 100, 1135; between 100 and 200, 548; between 200 and 500, 254; and above 500, 53—total, 11,197. The number of loans issued (the number of loans being the same as the number of tenants) under the Land Purchase Acts, 1885, 1891, and 1896, up to 31st March 1900, was 383, amounting to £145,204. The number of loans for agricultural improvements sanctioned under sect. 31 of the Land Act, 1881, between 1882 and 1900, was 270, and the amount issued was £20,456. The total amount issued on loan for all classes of works under the Land Improvement Acts, from the commencement of operations in 1847 to 31st March 1900, was £71,524. (W. H. Po.)

Kingsley, Mary Henrietta (1862–1900), English traveller and author, daughter of George Henry Kingsley, was born in Islington, London, 13th October 1862. A delicate child, not considered strong enough to face school life, her early years were spent at home. Her father, though less widely known than his celebrated brothers, Charles and Henry,¹ was a man of versatile abilities, and had a passion for travelling, which he managed to indulge in combination with his professional care of individual patients. Mary Kingsley's reading in history, poetry, and philosophy was wide if desultory, but she was most attracted to natural history. Her family, which had settled in Highgate in 1862, removed to Bexley in 1879 and to Cambridge in 1886, and this last change proved beneficial to her health. From 1888 to 1892 the illness of her mother developed those qualities of self-reliance which stood her afterwards in such good stead. The loss of both parents in 1892 left her free to pursue her own course, and she resolved to travel and investigate the forms of religion and law among uncivilized races. She started for West Africa in August 1893, with a few introductions to Portuguese colonists, and making her way across much

¹ Henry Kingsley (1830–1876), was born in Notts, 2nd January 1830, and after being educated at King's College, London, and Worcester College, Oxford, went in 1853 to live in Australia. In 1858 he returned to England, and in the next year published a novel, *Geoffrey Hamlyn*, full of stirring scenes of colonial life. In 1861 appeared his most famous story, *Ravenhoe*, and in 1865 *The Hilliards and the Burtons*. These, his best-known works, are characterized by much vigour and a healthy, robust taste for incident and sentiment. Henry Kingsley died in Sussex, 24th May 1876.

country hitherto untrdden by Europeans, went up the Congo as far as Kabinda and Matadi, and returned to England in June 1894. She gained sufficient knowledge of the native customs to contribute afterwards an introduction to Mr Dennett's *Notes on the Folk Lore of the Fjort*, 1898. Miss Kingsley made careful preparations for a second exploration of the same region, and at the end of 1894 she proceeded *via* Old Calabar to French Congo, and ascended the Ogowé river. From this point her journey was a long series of adventures and hairbreadth escapes, at one time from the dangers of land and water, at another from the cannibal Fans. The story is vividly told in her *Travels in West Africa*. The book aroused a wide interest, and she lectured to scientific gatherings on the fauna, flora, and folklore of West Africa, and to commercial audiences on the trade of that region and its possible developments, always with a protest against the lack of detailed knowledge characteristic of modern dealings with new fields of trade. In both cases she spoke with authority, for she had brought back a considerable number of new specimens of plants and fishes, and had herself traded in rubber and oil in the districts through which she passed. With undaunted energy Miss Kingsley was again on her way in 1900 to the West Coast, but she proceeded in the first instance to South Africa, and she died at Simon's Town, where she was engaged in nursing Boer prisoners, on 3rd June 1900.

King's Mountain, a mountainous ridge in Gaston county, North Carolina, and York county, South Carolina, U.S.A. It is an outlier of the Blue Ridge, running parallel with it, *i.e.*, north-east and south-west, and its highest point, Mount Crowder, has an altitude of some 3000 feet. One of the battles of the American Revolution, known as King's Mountain, was fought near the southern end of this ridge, in South Carolina, 7th October 1780. The American loss was 28 killed, 60 wounded; the British loss, 389 killed, 716 prisoners.

Kingston, the chief city of Frontenac county, Ontario, Canada, at the north-eastern extremity of Lake Ontario, 260 feet above the sea. It is an important station on the Grand Trunk railway, and terminus of the Kingston and Pembroke railway, and has steamboat communication with other ports on Lake Ontario, on the St Lawrence and the Rideau canal. It contains a fine stone graving-dock, 280 feet long, 100 feet wide, and with a depth of 16 feet at low water on the sill. The fortifications, which at one time made it one of the strongest fortresses in Canada, are now out of date, and would offer little resistance to modern artillery. It is the seat of an archbishopric, Queen's University, the Royal Military College, and an artillery school. Vessels entered inwards in 1900–1901, 1253, of 405,499 tons; exports, \$133,696; imports, \$1,245,841; total assessment of the city in 1899, \$7,809,554. Population (1881), 14,091; (1891), 19,263; (1901), 17,961.

Kingston, capital of Ulster county, New York, U.S.A., on the west bank of the Hudson, 90 miles above New York, at an altitude of 185 feet. It is on the West Shore, the Ulster and Delaware, and the Wallkill Valley railways, has ferry communication with Rhinecliff, on the opposite bank of the Hudson, and regular steamboat communication with New York, Albany, and other river points. In 1900 it had 344 manufacturing establishments, with \$3,657,551 capital, employing 2685 hands and producing goods valued at \$5,280,478. Of its manufactures, cigars, cigarettes, and tobacco formed the largest item, with a value of \$1,188,555. The manufacture of lime and cement was also important. Population (1890),

21,261; (1900), 24,535, of whom 3551 were foreign-born and 545 negroes.

Kingston-on-Thames, a parish, municipal borough, and market town of England, 12 miles west of London Bridge, on the right bank of the Thames, in the Kingston parliamentary division of Surrey. It is a station on the London and South-Western railway. Besides All Saints' Church, restored in 1888, there are in Kingston four parish churches, and Roman Catholic, Presbyterian, Congregational, Baptist, Friends', and other places of worship. Recent public buildings are the Albany Hall (1883), the Free Library (1883), and the County Hall (1893). At Norbiton, within the borough, is the Royal Cambridge Asylum for soldiers' widows (1854). At Kingston Hill is an industrial and training school for girls, opened in 1892. The Victoria Hospital was erected in 1898. The municipal borough has an area of 1114 acres. Population (1881), 20,648; (1891), 27,059; (1901), 34,375.

Kingstown, a seaport and urban sanitary district in the county of Dublin, Ireland, on Dublin Bay, 6 miles east-south-east of Dublin by rail. An electric tramway now runs through the township. In 1899, 134 vessels were registered in the fishery district, employing 546 hands. Population (1881), 18,230; (1901), 17,356.

King William's Town, a town of Cape Colony, on the Buffalo river, a few miles north-west of East London, with which it is connected by rail. "King," as it is locally called, is an important administrative centre, and has become a flourishing trading place and depôt for the traffic between the neighbouring Kaffres and the white settlers. Many of these settlers are Germans, descendants of the Anglo-German legion which was disbanded after the Crimean war. Most of the farmsteads dotted along the banks of the river are inhabited by them; hence such names as *Berlin*, *Potsdam*, *Braunschweig*, *Frankfurt*, given to settlements in this part of the country. Population (1881), 6000; (1901), 7226.

Kinning Park, a police burgh of the lower ward of Lanarkshire, Scotland, on the south bank of the Clyde between Glasgow and Govan; it is connected with the city by tramway and subway. Since 1850 it has grown from a rural village to a busy industrial centre, populated by artisans and labourers, and sharing in the activities of the burghs which enclose it. Its industries are engineering, bread and biscuit baking on a considerable scale, soap-making, and paint-making. The Police Commission maintains a police force and a small fire brigade, and Glasgow gas and water are used. Area, 108 acres; population (1901), 13,851.

Kinross-shire, an inland county of Scotland, next to Clackmannan the smallest in the country, bounded on the N. and W. by Perthshire, on the E. and on the S. by Fifeshire.

Area and Population.—In 1891 Kinross resigned part of the parish of Portmoak to Fife and parts of Arngask and Forgan-denny to Perth, receiving from Fife parts of the parishes of Dunfermline, Balingry, and Kinglassie, and from Perth a portion of its own parish of Fossoway and Tulliebole. The area of the county is 55,849 acres, or 87.2 square miles. The population was in 1881, 6697; in 1891, 6280; in 1891, on the above area, 6673; in 1901, 6980, of whom 3342 were males and 3638 females. On the old area, taking land only (46,487 acres, or 72.6 square miles), the number of persons to the square mile in 1891 was 86, and the number of acres to the person 7.4. In the registration county the population decreased between 1881 and 1891 by 8.2 per cent. Between 1881 and 1891 the excess of births over deaths was 521, but the resident population decreased by 603. The table on the next page gives particulars of births, deaths, and marriages in 1880, 1890, and 1899.

Year.	Deaths.	Marriages.	Births.	Percentage of Illegitimate.
1880	143	36	204	11.2
1890	124	57	173	7.51
1899	104	40	173	4.6

The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881-90.	1890.	1891-98.	1899.
Birth-rate . . .	27.67	24.53	25.55	26.40	27.94
Death-rate . . .	19.39	17.11	18.31	17.20	16.79
Marriage-rate . . .	4.88	5.91	8.42	6.08	6.46

There were 58 Gaelic-speaking persons in the country in 1891, and one foreigner. Valuation in 1889-90, £64,004; 1899-1900, £67,030.

Administration.—The county unites with Clackmannan to return a member to Parliament. The only towns are Kinross (2136), the county town and a police burgh, which has a town hall, a county hall, two railway stations, and several textile factories; and Milnathort. There are five civil parishes, which had 101 paupers and dependants in September 1899. The county forms a sheriffdom with Fife, and a sheriff-substitute sits at Kinross.

Education.—Five school boards manage 6 schools, which had in 1898-99 an average attendance of 733, while a private school in Orwell parish had 133. The county committee provides bursaries for scholars attending Dollar Institution, and the county council spends part of the "residue" grant in agricultural experiments.

Agriculture.—In 1898, 63 per cent. of the area was under cultivation, the county ranking fifth in Scotland in this regard. The standard of farming is high, though the climate is cold and wet. In 1895 the average size of the 302 farms in the county was 119 acres; only 13.58 per cent. were under 5 acres; 23.51 between 5 and 50, and 62.91 were over 50 acres. Fifty-four farms were between 50 and 100 acres, 112 between 100 and 300, 21 between 300 and 500, and there were 3 over 500. Stock-raising is the staple industry. The following table gives the principal acreages at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	31,372	7417	3773	12,288	7,872	22
1885	32,246	6558	3339	11,689	10,645	15
1890	32,278	5924	3138	10,350	12,854	6
1895	35,846	6892	3526	11,633	13,761	19
1899	35,357	6939	3481	12,576	12,323	19

The following table gives particulars of the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	1051	5763	1045	27,966	461
1885	944	6475	1284	30,518	548
1890	894	6106	1110	35,539	520
1895	1179	6948	1196	36,239	515
1899	1106	7091	1321	40,920	671

In 1895, 3258 acres were under wood. At the census of 1891, 727 men and 68 women were engaged in agriculture.

Kinsale, a maritime town, urban sanitary district, and formerly (until 1885) a parliamentary borough in the county of Cork, Ireland, on the estuary of the Bandon, 24 miles south of Cork by rail. The number of vessels registered in the fishery district in 1899 was 220, employing 1064 men and boys. A fishery pier has been constructed at a cost of £22,000. Population (1881), 4976; (1901), 4250.

Kiôtô, or Kyôtô, the former capital of Japan, in the province of Yamashiro, in 35° 01' N. and 135° 46' E., with a population of 353,139, being thus the third of the empire's chief cities (*fu*). The Kamo-gawa, upon which it stands, is a mere rivulet in ordinary times, trickling through a wide bed of pebbles; but the city is traversed by several aqueducts, and was connected with Lake Biwa in 1890 by a canal 6½ miles long, which carries an abundance of water for manufacturing purposes, brings the great lake and the city into navigable communication, and forms with the Kamo-gawa canal and the Kamo-gawa itself a through route to Osaka, from which Kiôtô is 25 miles distant by rail. Founded in the year 793, Kiôtô remained the capital of the empire during nearly eleven centuries. The Emperor Kuwammu, when he selected this remarkably picturesque spot for the residence of his court, caused the city to be laid out with mathematical accuracy, after the model of the Tang dynasty's capital in China. Its area, 3 miles by 3½, was intersected by 18 principal thoroughfares, 9 running due north and south, and 9 due east and west, and the two systems being connected at intervals by minor streets. At the middle of the northern face stood the palace, its enclosure covering ¾ of a square mile, and from it to the centre of the south face ran an avenue 283 feet wide and 3½ miles long. Conflagrations and subsequent reconstructions modified the regularity of this plan, but much of it still remains, and its story is perpetuated in the nomenclature of the streets. In its days of greatest prosperity Kiôtô contained only half a million inhabitants, thus never even approximating to the size of the Tokugawa metropolis, Yedo, or the Hôjô capital, Kamakura. The Emperor Kuwammu called it Heian-jô, or the "city of peace," when he made it the seat of government; but the people knew it as "Miyakô," or "Kyôtô," terms both of which signify "capital," and in modern times it is often spoken of as "Saikyô," or western capital, in opposition to "Tôkyô," or "eastern capital." Having been for nearly eleven centuries the imperial, intellectual, political, and artistic metropolis of the realm, the city abounds with evidences of its unique career. Magnificent temples and shrines, grand monuments of architectural and artistic skill, beautiful gardens, gorgeous festivals, and numerous *ateliers* where the traditions of Japanese art are obeyed with attractive results, offer to the foreign visitor a mine of exhaustless interest. Clear water ripples everywhere through the city, and to this water Kiôtô owes something of its importance, for nowhere else in Japan can fabrics be bleached so white or dyed in such brilliant colours. The people, like their Osaka neighbours, are full of manufacturing energy. Not only do they preserve, amid all the progress of the age, their old-time eminence as producers of the finest porcelain, faience, embroidery, brocades, bronze, *cloisonné* enamel, fans, toys, and metal work of all kinds, but they have also adapted themselves to the foreign market, and are now weaving and dyeing quantities of silk fabrics, for which a large and constantly growing demand is found in Europe and America. Nowhere else can be traced with equal clearness the part played in Japanese civilization by Buddhism, with its magnificent paraphernalia and imposing ceremonial spectacles; nowhere else, side by side with this luxurious factor, can be witnessed in more striking juxtaposition the austere purity and severe simplicity of the Shintô cult; and nowhere else can be more intelligently observed the fine faculty of the Japanese for utilizing, emphasizing, and enhancing the beauties of nature. The citizens' dwellings and the shops, on the other hand, are insignificant and even sombre in appearance, their exterior conveying no idea of the pretty chambers within or of the tastefully-laid-out grounds upon which they open behind. Kiôtô is celebrated equally for its

cherry and azalea blossoms in the spring, and for the colours of its autumn foliage. (F. BY.)

Kipling, Rudyard. See ENGLISH LITERATURE.

Kirchhoff, Gustav Robert (1824–1887), German physicist, was born at Königsberg (Prussia) on 12th March 1824, and was educated at the university of his native town, where he graduated Ph.D. in 1847. After acting as *privat-docent* at Berlin for some time, he became extraordinary professor of physics at Breslau in 1850. Four years later he was appointed professor of physics at Heidelberg, and in 1875 he was transferred to Berlin, where he died on 17th October 1887. Kirchhoff's contributions to mathematical physics were numerous and important, his strength lying in his powers of stating a new physical problem in terms of mathematics, not merely in working out the solution after it had been so formulated. A number of his papers were concerned with electrical questions. One of the earliest was devoted to electrical conduction in a thin plate, and especially in a circular one, and it also contained a theorem which enables the distribution of currents in a network of conductors to be ascertained. Another discussed conduction in curved sheets; a third the distribution of electricity in two influencing spheres; a fourth the determination of the constant on which depends the intensity of induced currents; while others were devoted to Ohm's law, the motion of electricity in submarine cables, induced magnetism, &c. In others papers, again, various miscellaneous topics were treated—the thermal conductivity of iron, crystalline reflection and refraction, certain propositions in the thermodynamics of solution and vaporization, &c. An important part of his work was contained in his *Vorlesungen über Mathematische Physik* (1876), in which the principles of dynamics, as well as various special problems, were treated in a somewhat novel and original manner. But his name is best known for the researches, experimental and mathematical, in radiation which led him, in company with Bunsen, to the development of spectrum analysis as a complete system in 1859–60. He can scarcely be called its inventor, for not only had many investigators already used the prism as an instrument of chemical inquiry, but considerable progress, to say the least, had been made towards the explanation of the principles upon which spectrum analysis rests. But to him belongs the merit of having, most probably without knowing what had already been done, enunciated a complete account of its theory, and of thus having firmly established it as a means by which the chemical constituents of celestial bodies can be discovered through the comparison of their spectra with those of the various elements that exist on this earth.

Kirk, Sir John (1832—), British naturalist and administrator, was born at Barry, near Arbroath, on 19th December 1832, and was educated for the medical profession. He graduated M.D. at Edinburgh in 1854, and, after serving on the civil medical staff throughout the Crimean war, was appointed physician and naturalist to Dr Livingstone's second exploring expedition in February 1858. He was by Livingstone's side in most of his journeyings and adventures, and was one of the first four white men to behold Lake Nyasa (16th September 1859). He was finally invalided home on 9th May 1863. His African experience qualified him for the post of vice-consul at Zanzibar, bestowed upon him in 1866. In 1873 he became consul, and shortly afterwards concluded a treaty with the sultan providing for the extinction of the slave trade in his dominions. Sir John Kirk retired from the consular service in 1887, and subsequently represented the British Government at the African conferences held at Brussels in 1888–90, as commissioner on the Niger

coast in 1895, and as a member of the committee for constructing the Uganda railway. Besides being foreign secretary to the Royal Geographical Society, he received its gold medal in 1882. Sir John Kirk married Miss Helen Cooke in 1867, and was made K.C.B. in 1881, and subsequently G.C.M.G.

Kirkcaldy, a royal and parliamentary burgh (Kirkcaldy group) and seaport town of Fifeshire, Scotland, on the Firth of Forth, 26 miles north of Edinburgh by rail (Forth Bridge route). Although within recent years no addition has been made to the harbour accommodation, the shipping trade—chiefly with Baltic ports—continues to increase. In 1885, 2293 vessels of 586,543 tons entered, and 2386 of 227,673 tons cleared; in 1900, 3190 vessels of 1,328,500 tons entered, and 3308 of 1,388,410 tons cleared. In the latter year the exports were valued at £1,678,650, and the imports at £280,100. Several important public buildings have been erected: sheriff court buildings in 1893, high school—succeeding the burgh school—in 1894, the Swan memorial hall, with rooms for the Young Men's Christian Association, the Adam Smith memorial hall, and the Beveridge public hall and free library (1894). A beautiful park, at the north-west end, with an area of 110 acres, was presented in 1892. Population (1891), 27,151; (1901), 34,064.

Kirkcudbright, a royal and parliamentary burgh (Dumfries group), and the county town of Kirkcudbrightshire, Scotland, on the river Dee, 6 miles from the sea. Its first charter dates from 1455. There are county buildings, a town hall, and a museum. There is a regular water-supply. The river is spanned by an iron bridge, which can be opened for the purpose of allowing the passage of vessels. The harbour is excellent, but shipping is inconsiderable, as also are manufactures. The churches are Established, two United Free (one 1880), Episcopal (1870), and Roman Catholic (1880). Besides an academy, there are four public schools, and the average attendance at elementary classes in 1898–99 was 445; an Old Church school had 156, and a Roman Catholic school 134. Population (1881), 2571; (1891), 2533; (1901), 2386.

Kirkcudbrightshire, or the STEWARTRY OF KIRK-CUDBRIGHT, a maritime county of south-west Scotland, bounded on the N. and N.W. by Ayrshire, on the E. and N.E. by Dumfriesshire, on the S. by the Solway Firth and the Irish Sea, and on the W. by Wigtownshire and Wigtown Bay.

Area and Population.—According to the latest official estimate, the area of the county (foreshore excluded) is 582,251 acres, or about 909 square miles. The population was, in 1881, 42,127; in 1891, 39,985; in 1901, 39,407, of whom 18,759 were males and 20,648 females. Taking the land area only (574,588 acres or 897·8 square miles), the number of persons to the square mile was 45 and the number of acres to the person 14·0. Between 1881 and 1891 the population of the registration county decreased by 5 per cent. Between 1881 and 1891 the excess of births over deaths was 4335, and the decrease of the resident population 2143. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Per cent. of Illegitimate.
1880	707	207	1291	15·6
1890	729	232	1044	14·18
1899	663	221	978	11·8

The following table gives the birth-rate, death-rate, and marriage-rate per thousand of the population for a series of years:—

	1880.	1881–90.	1890.	1891–98.	1899.
Birth-rate . . .	30·54	28·19	25·89	26·24	25·50
Death-rate . . .	16·73	17·71	18·07	17·14	17·28
Marriage-rate . .	4·90	5·45	5·75	5·44	5·76

There were 69 Gaelic-speaking persons in the county in 1891, and 16 foreigners. Valuation in 1889-90, £346,477; 1899-1900, £341,728.

Administration.—The county returns one member to Parliament, and Kirkcudbright (2386), the county town, is one of the Dumfries group of parliamentary burghs; New Galloway was, with the other burghs of the Wigtown group, merged in its county for parliamentary representation in 1885. There are 28 civil parishes in the county, with a combination poorhouse at Kirkcudbright, and the number of paupers and dependants in September 1899 was 1107. Kirkcudbright forms a part of the sheriffdom of Dumfries and Galloway, and there is a resident sheriff-substitute at Kirkcudbright, who sits also at Castle Douglas, Maxwelltown, New Galloway, and Creetown.

Education.—Thirty school boards manage 63 schools, which had an average attendance of 5990 in 1898-99, while 6 voluntary schools (of which four are Roman Catholic, and one Episcopal) had 505. There is an academy at Kirkcudbright, and the county committee subsidizes also high schools at Dumfries and Newton-Stewart, while 13 other public schools in the county earned grants in 1898 for giving higher education. Part of the "residue" grant is handed over by the county council to the secondary committee, and is expended on technical classes at Kirkcudbright, Dalbeattie, Castle Douglas, and Dumfries, and part is spent by the council directly in supporting a dairy association, manuring experiments and lectures, and cookery classes.

Agriculture.—The percentage of the area under cultivation in 1898 was 32.9. The greater part of the land is either waste or poor pasture. Green crops rather than grain are favoured by the climate, and cattle breeding and feeding, and dairying (with cheese-making as a staple) are the leading agricultural industries. The average size of the 1605 holdings in 1898 was 119 acres. The percentage under 5 acres was 14.70, between 5 and 50 acres 29.85, and over 50 acres 55.45. Farms between 50 and 100 acres numbered 234; between 100 and 300, 486; between 300 and 500, 142, and over 500, 28. The following table gives the principal acreages at intervals of five years from 1880:—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	177,079	32,672	17,171	67,680	59,418	138
1885	182,490	32,176	16,953	69,482	63,530	349
1890	186,580	29,107	17,395	68,269	71,644	132
1895	191,028	27,860	16,808	60,998	85,109	221
1899	191,626	27,529	15,782	63,348	84,845	100

The following table gives particulars of the live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calv.	Sheep.	Pigs.
1880	5476	42,463	11,685	381,874	5019
1885	5673	43,926	14,489	357,361	7025
1890	5719	46,933	14,699	402,033	7729
1895	6190	48,213	16,256	381,115	7892
1899	5476	49,539	16,246	399,338	8265

In 1895, 19,285 acres were under wood, of which 1203 had been planted since 1881. The number of persons returned at the census of 1891 as connected with the pursuit of agriculture was 5281 men and 531 women.

Industries and Trade.—Industries apart from agriculture are not of great importance. Kirkcudbright comes next to Aberdeen as a granite-producing county; the output was 55,388 tons valued at £35,358 in 1895, and 53,633 tons valued at £28,429 in 1899. Kirkcudbright, Creetown, and Gatehouse are the principal ports, and the exports are mainly agricultural produce, the imports coal and miscellaneous. The fishing industry can scarcely be said to exist. The number of persons connected with industrial pursuits in 1891 was 6000.

BIGGAR. *The Agriculture of Kirkcudbrightshire*. Castle Douglas, 1876.

(W. W.A.)

Kirkintilloch, a burgh of barony and police burgh of Dumbartonshire, Scotland, on the Forth and Clyde Canal, 8 miles north-north-east of Glasgow by rail.

Iron-founding, muslin-weaving, and chemical-manufactures are the chief industries. A drainage system has been laid, and a memorial erected (1891) to Miss Beatrice Clugston, to whom was largely due the foundation of the Broomhill Homes in the burgh. In 1898 the burgh acquired as a public park the Peel, containing traces of the Roman wall, a fort, and the foundation of Comyn's Castle. Baptist and Original Secession chapels have been erected. Population (1881), 8029; (1891), 10,312; (1901), 10,502. The suburb of LENZIE, partly included in the burgh, is inhabited chiefly by Glasgow business men. It has a public hall, academy, and an asylum of the Glasgow City Lunacy Board. Population (1891), 1916; (1901), 1879.

Kirk-Kilisseh, a town in the sanjak of Adrianople, European Turkey, 35 miles east of Adrianople. The name signifies "four churches," and the town possesses many mosques and Greek churches. It has an important trade with Constantinople in butter and cheese, and other articles of commerce are wine, brandy, cereals, and tobacco. Population, 18,000, of whom 3000 are Turks, 9000 Greeks, 5400 Bulgarians, and 600 Jews.

Kirkville, capital of Adair county, Missouri, U.S.A., on the Omaha, Kansas City and Eastern, and the Wabash railways, at an altitude of 975 feet. Situated in an agricultural region, its manufactures consist in great part of agricultural tools and machines. Population (1880), 2314; (1900), 5966, of whom 112 were foreign-born and 291 negroes.

Kirkwall, a royal and parliamentary burgh (Wick group) and the county town of Orkney, Scotland, on a bay of the island of Pomona, the largest of the group. It is 51 miles north of Wick in a straight line, and 225 from Leith by steamer. Municipal buildings have been erected, and there are county buildings. A United Free church has been built. A second pier was erected to improve the harbour in 1885. The industries are those connected with fishing and shipping, and there are two distilleries adjacent. At the end of 1900 the port register contained 39 vessels of 2287 tons. In 1888, 2414 vessels of 214,710 tons entered; in 1900, 2385 vessels of 226,124 tons. The total trade barely exceeds £10,000 in value annually. Population (1881), 3923; (1901), 3660.

Kirmán (KERMÁN, KARMÁN), the capital of the Persian province of the same name, situated in 30° 17' N. and 56° 59' E., at an elevation of 6080 feet. Its population is estimated at 45,000, including about 2000 Zoroastrians, 150 Jews, and a few Shikárpúri Indians. Kirmán has post (since 1878) and telegraph (since 1879) offices, and a British consulate and an agency of the Imperial Bank of Persia have been established. Kirmán and neighbouring districts produce little grain, and have to get their supplies from districts far away for four or five months of the year. A well-known traveller once said it was easier to get a man (6½ lb) of saffron at Kirmán than a man of barley to feed his horse, and the writer in 1879 was ordered by the authorities to curtail his trips in the province, "because his horses and mules ate up all the stock." (A. H. S.)

Kirriemuir, a police burgh, manufacturing town, and railway station of Forfarshire, Scotland, 5 miles west-north-west of Forfar. It is the "Thrums" of J. M. Barrie, the novelist, who was born here. It has two large linen factories. There are a public hall and a public park. The Original Secession chapel (Barrie's "Auld Licht kirk"), founded 1806, was rebuilt 1893. Population (1881), 4390; (1901), 4096.

Kir-shehr, the ancient *Mocissus-Justinianopolis*,

the chief town of a sanjak of the same name in the Angora vilâyet of Asia Minor, situated on a tributary of the Kizil Irmak, on the Angora-Kaisariéh road. The town gives its name to the excellent carpets made in the vicinity. It is on the line of the projected railway from Angora to Kaisariéh. Population (1900), 9000 (900 Christians).

Kishangarh, a native state of India, in the Rajputana Agency. Area, 874 square miles; population (1881), 112,633; (1891), 125,516, showing an increase of 11 per cent.; average density, 144 per square mile. In 1901 the population was 88,200, showing a decrease of 30 per cent., due to the results of famine. The revenue (1896-97) was Rs.5,68,097; no tribute; number of schools, 20. The chief, whose title is maharaja, is a Rajput of the Rahtor clan. The reigning maharaja, Sardul Singh, G.C.I.E., was born in 1857, and succeeded his father in 1879. He is connected by marriage with all the great houses of Rajputana. The administration, under the Diwan, is highly spoken of. Irrigation from tanks and wells has been extended; factories for ginning and pressing cotton have been started; and the social reform movement, for discouraging excessive expenditure on marriages, has been very successful. The state is traversed by the Rajputana railway. It suffered severely from the famine of 1899-1900. In 1897-98 rupees were coined at the mint to the value of Rs.1,03,379, bearing on the obverse the name of Queen Victoria in Persian characters. The town of KISHANGARH is 18 miles north-east of Ajmir by rail. Population (1881), 14,824; (1891), 15,363. It is the residence of many Jain merchants.

Kishinev, a town of Russia, capital of the government of Bessarabia, 120 miles by rail north-west of Odessa and 30 miles from the Rumanian frontier. Population, which is very mixed, and contains many Moldavians and Jews (1862), 91,532; (1897), 108,796. It has now a considerable number of schools, including a gardening school; a museum of natural sciences, agriculture, and domestic industries; a public library, and a botanic garden. Fruit-gardens, vineyards, and plantations of silk-worm trees and tobacco cover its suburbs. Factories, chiefly distilleries, develop but slowly, but the trade in corn, wine, tobacco, fruit, tallow, hides, wool, and cattle (exported abroad), is rapidly growing, and its yearly fair is of importance.

Kissingen, a town and watering-place of Bavaria, Germany, district Lower Franconia, on the Franconian Saale, 43 miles by rail north by east of Würzburg. It is visited annually by 14,000 persons. A marble statue of Ludwig I. of Bavaria was placed in the spa garden in 1891. Population (1900), 4755.

Kistna, a district of British India, in the north-east of the Madras Presidency. Masulipatam, the district headquarters, was the first British settlement on the Coromandel coast (1611), and was captured from the French in 1758. Linguistically, almost all the inhabitants speak Telugu. Area, 8397 square miles; population (1881), 1,548,480; (1891), 1,855,582, showing an increase of 20 per cent.; average density, 221 persons per square mile. In 1901 the population was 2,155,199, showing a further increase of 16 per cent. The land revenue and rates were Rs.64,25,525, the incidence of assessment per acre being Rs.2 : 4 : 0 on *ryotwari* and Rs.0 : 10 : 9 on *zamindari* lands; number of police, 1097. In 1897-98, out of a total cultivated area of 2,129,559

acres, 432,960 were irrigated, including 384,457 from Government canals. Upon the Kistna delta system of canals, which are available also for navigation, connecting with the Godavari system, the capital expenditure has been Rs.1,31,91,665, and the profit in 1897-98, after allowing for interest and all indirect charges, was Rs.12,52,028, or more than 10 per cent. The surplus rice thus raised in the delta serves to protect the other portions of the district from the effects of drought, to which it has always been liable. The principal crops are rice, millet, other food grain, pulse, oil-seeds, cotton, indigo, tobacco, and a little sugar-cane. There are 11 factories for ginning and pressing cotton. The cigars known in England as Lunkas are partly made from tobacco grown on *lankas* or islands in the Kistna. The manufacture of chintzes at Masulipatam is a decaying industry, but cotton is woven everywhere for domestic use. Salt is evaporated, as a Government monopoly, along the coast. The diamond mines visited by Tavernier, which are said to have yielded the Kohinoor stone, are no longer worked. Bezwada, at the head of the delta, is a place of growing importance, as the central junction of the East Coast railway system, which crosses the inland portion of the district in three directions. Some sea-borne trade, chiefly coasting, is carried on at the open roadsteads of Masulipatam and Nizampatam, both in the delta. In 1897-98 the total was valued at Rs.27,51,324. The Church Missionary Society supports a college at Masulipatam, and the American Lutheran Mission a smaller one at Guntur—total students in 1896-97, 109. In that year there were 1828 schools, attended by 45,653 pupils, the proportion of boys at school to the male population of school-going age being 26 per cent., and the proportion of girls 6.6 per cent. There are 7 printing-presses, issuing two English and three vernacular periodicals, and several reading-rooms, clubs, and literary institutes. Death-rate (1897), 22 per thousand. (j. s. co.)

Kites, Military.—A kite, consisting of a framework of sticks spreading a light sail of cloth or other material, and held by a string against the pressure of the

FIG. 1.—Military Kite and Basket.

wind, forms so extremely simple a method of lifting anything to a height in the air, that it has naturally been suggested as being suitable for various military purposes (Fig. 1)—for instance, for signalling to a long distance,

carrying up flags, or lamps, or semaphores. Trials have been made both in the British army (at Aldershot and elsewhere) and navy, in the latter case for floating torpedoes on hostile positions. As much as two miles of line have been paid out. For purposes of photography a small kite carrying a camera to a considerable height may be caused to float over a fort or other place of which a bird's-eye view is required, the shutter being operated by electric wire, or slow match, or clockwork. Many successful

arrangement he has frequently ascended as high as 100 feet. The kites were hexagonal, being 12 feet high and 12 feet across. The apparatus, which could be packed in a few minutes into a simple roll, weighed in all about 1 cwt. This appliance was proved to be capable of raising a man even during a dead calm, the retaining line being fixed to a waggon and towed along. Lieut. H. D. Wise made some trials in America in 1897 with some large kites of the Hargrave pattern (Hargrave having previously himself ascended in Australia), and succeeded in lifting a man 40 feet above the ground. In the Russian army a military kite apparatus has also been tried, and was in evidence at the manœuvres in 1898. Experiments on a small scale have also been carried out by most of the European Powers. (B. F. S. B.-P.)

FIG. 2.—Military Kite lifting a Man.

photographs have been thus obtained in England and America.

The problem of lifting a man by means of kites instead of by a captive balloon is a still more important one. The chief advantages to be gained are: (1) less transport is required; (2) they can be used in a strong wind; (3) they are not so liable to damage, either from the enemy's fire or from trees, &c., and are easier to mend; (4) they can be brought into use more quickly; (5) they are very much cheaper, both in construction and in maintenance, not requiring any costly gas.

Early in the 19th century one Pocock suggested the use of man-lifting kites for military purposes, and an apparatus was tested at Chatham in 1876, but it failed to lift a man. Captain Baden-Powell, of the Scots Guards, in June 1894 constructed, at Pirbright Camp, a huge kite 36 feet high, with which he successfully lifted a man on different occasions (Fig. 2). He has since improved the contrivance, using five or six smaller kites attached together in preference to one large one. With this

blocked in recent geological times by the elevation of the volcanic peaks which dammed back the water, causing it finally to overflow to the south. The whole of the region to the north is of great interest. The volcanoes (sometimes known generally as the Kirunga mountains) form two groups, separated by a vast lava-field. In the west are the still active peaks, Kirunga-cha-gongo and Kirunga-cha-moto, the former 11,350 feet high. The eastern peaks are still higher, and are snow-clad for part at least of the year. The principal are Sabyin, Karisimbi (13,000 feet), and at the eastern end of the line, that formerly known as Mfumbiro (and sometimes also as Kirunga), which reaches some 14,000 feet. It has a small crater filled with water on the summit. Mfumbiro is said to be the name of a district to the north containing many hundreds of low peaks and craters, now extinct. The eastern

Kivu, a considerable lake lying in the Central African rift valley, about 60 miles north of Tanganyika, into which it discharges its waters by the Rusizi river, thus belonging to the Congo system. On the north it is separated from the basin of the Nile by a line of volcanic peaks. The length of the lake is about 55 miles, and its greatest breadth over 30, giving an area, including islands, of about 1100 square miles. It is roughly triangular in outline, the longest side lying to the west. The coast-line is much broken, especially on the south-east, where the indentations present a fjord-like character. The lake is deep, and the shores are everywhere high, rising in places in bold precipitous cliffs of volcanic rock. A large island, Kwijwi or Kwichwi, oblong in shape and traversed by a hilly ridge, runs in the direction of the major axis of the lake, south-west of the centre, and there are many smaller islands. The lake has many fish, but no crocodiles or hippopotami. South of Kivu the rift valley is blocked by huge ridges, formed of the same eruptive rocks of which the plateaux to the east and west are composed. Through these the Rusizi now breaks its way in a succession of deep gorges, emerging from the lake in a foaming torrent, and descending 2000 feet to the lacustrine plain at the head of Tanganyika. There is evidence that the lake was not always drained thus, the ancient water-parting having probably been formed by the eruptive ridge above referred to. The lake fauna is a typically fresh-water one, presenting no affinities with the marine or "halolimnic" fauna of Tanganyika, but similar to that shown by fossils to have once existed in the more northern parts of the rift valley. The former outlet or extension in this direction seems to have been

Kirunga separates the basins of the principal feeders of the Albert Edward and Victoria Nyanzas, the Ruchuru and Kagera. Lake Kivu and Mfumbiro were first heard of by Captain Speke in 1861, but not visited by a European until 1894, when Count von Götzen passed through the country on his journey across the continent. The lake and its vicinity have been carefully explored by Dr Kandt, Captain Bethe, Mr E. S. Grogan, Mr J. S. Moore, and Major Gibbons. The ownership of the region has for some time been in dispute between Germany and the Congo State. In the map accompanying the agreement between the two parties in 1885, the boundary was shown as the Rusizi, while in other maps and documents of the same and later dates it was defined as running in a direct line from the head of Tanganyika to the intersection of 30° E. with 1° 20' S., thus giving the whole of the Kivu region to the Congo State. The difference was, in 1901, in process of settlement on the spot by the labours of a mixed commission.

See KANDT, in *Mitt. aus den Deutschen Schutzgebieten*, No. 3, 1900.—GROGAN, in *Geographical Journal* for August 1900.—MOORE, *ibid.*, January 1901; *To the Mountains of the Moon*, London, 1901. (E. HE.)

Kizil Irmak, *i.e.*, "Red River," the ancient *Halys*, the largest river in Asia Minor, rising in the Kizil Dagħ at an altitude of 6500 feet, and running south-west past Zara to Sivas. Below Sivas it flows south to the latitude of Kaisarieh, and then curves gradually round to the north. Finally, after a course of about 600 miles, it discharges its waters into the Black Sea between Sinope and Samsun, where it has formed a large delta. The only important tributaries are the Delije Irmak on the right and the Geuk Irmak on the left bank.

Kjerulf, Halfdan (1815–1868), Norwegian musical composer, born at Christiania in 1815, was the son of a high Government official. His early education was almost entirely aimed at fitting him for a legal career. In his 19th year he graduated at Christiania University, and not till he was nearly 26—on the death of his father—was he able to devote himself entirely to music, for which he had longed throughout his whole life. As a fact, he actually started on his career as a music teacher and composer of songs before ever having seriously studied music at all, and not for ten years did he attract any particular notice. Then, however, his Government paid for a year's instruction for him at Leipzig. For many years after his return to Norway Kjerulf tried in vain to establish serial classical concerts, while he himself was working with Björnson and other writers at the composition of lyrical songs. His fame rests almost entirely on his beautiful and manly national part songs and solos; but his pianoforte music is equally charming and simple. Kjerulf died at Grefsen, 11th August 1868.

Kladno, a mining town in Bohemia, 15 miles west-north-west of Prague. The iron and steel works of the Prague Iron Industry Association employ over 3000 hands, while nearly as many more are engaged in the company's coal mines, and another 3000 find occupation in the six pits worked by the Austro-Hungarian State railway. The production of iron and steel in 1893 was over 200,000 tons, and of coal 1,426,000 tons. Population (1890), 17,215; (1900), 18,600, Czechs.

Klagenfurt (Slovene, *Celovec*), the capital of the Austrian duchy of Carinthia, 41 miles north by west of Laibach, on the Glan, near Lake Wörth. Population (1890), 19,756, German and mostly Catholic; (1900), after the incorporation of some suburbs, 24,314. The town has an exceptionally high rate of illegitimacy. In 1892 it was 61 per cent. In 1888 the illegitimate births

were 512 and the legitimate 173. The death-rate declined from 32.6 in 1890 to 21.9 in 1895.

Klattau (Czech, *Klatovy*), chief town of a district of the same name in Bohemia, Austria, 25 miles west by south of Pilsen. It has a machine factory and foundry, steam corn and saw mills, breweries, and manufactories of chicory, lucifer matches, underlinen, &c. Population (1890), 10,811; (1900), 12,793, mostly Czech.

Klausenburg. See KOLOZSVÁR.

Klausthal, or CLAUSTHAL, a town of Hanover, Prussia, the chief mining town in the Upper Harz Mountains, 50 miles by rail west-south-west of Halberstadt. Its own mines are silver and lead, but it also smelts copper and a little gold. Four or five sanatoria are in the neighbourhood. The museum of the Upper Harz is at Zellerfeld. Population (1885), 8871; (1900), 8565.

Klintsy, a town of Russia, government and 95 miles north-east of Chernigov, on the railway to Bryansk. It has several woollen-cloth and sackcloth mills, knitting factories, tanneries, and various smaller factories, the yearly returns from which amount to about £200,000. Many artisans are engaged in shoemaking and the weaving of cloth, while the merchants carry on an important trade in furs, hides, hemp-seed, and cattle. Population (1897), 11,625.

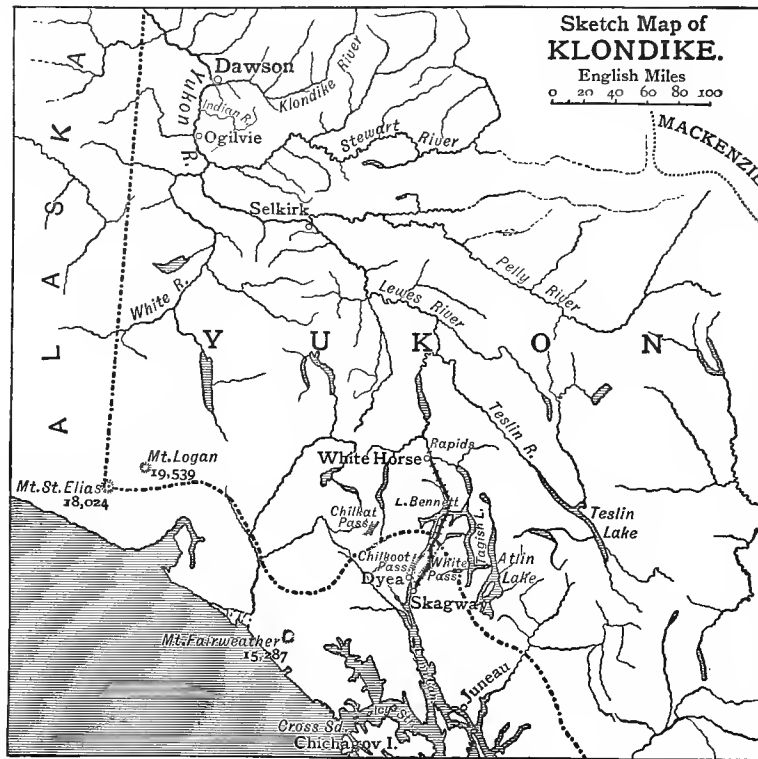

Klondike, a district in Yukon territory, north-western Canada, approximately in 64° N. and 140° W. The limits are rather indefinite, but the district includes the country about the course of Klondike river, a right-hand branch of the Yukon, together with its tributaries; and in popular usage also the mining region of Indian river, a second branch of the Yukon, flowing into it some distance above the Klondike. It is thus some 40 miles square and includes an area of approximately 1500 square miles. It is an area of hills, or low mountains, rising in the highest summits to altitudes of about 2200 feet above the Yukon or 3600 feet above the sea. Gold was discovered in this region in 1896, by one J. W. Carmach, aided, it is said, by his Indian wife. This discovery was made on Bonanza Creek, where it joins the Klondike just above its mouth. The discovery was followed by a stampede of miners from all the camps for hundreds of miles round, and the creek and its many branches were covered with claims from head to mouth. The "clean-up" of the following year, 1897, was a revelation to the world, and the arrival of a steamer at Seattle, bearing a ton of the yellow metal, was the signal for an exodus from all parts to this new Eldorado. The routes chiefly used were by the inside passage to the head of Lynn Canal, to Dyea, and Skagway, thence over the Chilkoot and White passes to the Yukon and down that stream. The city of Dawson was founded in 1897 as the metropolis of the district, and quickly became a large and flourishing city, with a most heterogeneous population. The Canadian Government, by the aid of its mounted police, maintained excellent order from the first. During 1897 and 1898 prices of labour and the necessaries of life were extravagantly high, but with the development of transportation lines on the Yukon, and the construction of the railway from Skagway, over White Pass and down the Yukon to White Horse rapids, freights were greatly reduced and prices approached a normal level.

The production of gold in the Klondike district was in 1897, \$2,500,000; 1898, \$11,000,000; 1899, \$16,000,000; 1900, \$20,000,000; 1901, estimated at over \$20,000,000. This production is entirely from placers. The placers were of two kinds, gulch and bench claims. The gulch claims are on branches of Klondike river—not on the main stream, which has been found almost barren—and mainly on Bonanza and Eldorado creeks, the latter a branch of the former,

although gold has been found on many other streams. The gold is found mainly at the bottom of the gravel, on the bedrock, requiring the removal of the overlying gravel. As this material is frozen throughout the year, thawing only near the surface in summer, mining involves a slow and laborious process of artificially melting the frozen gravel. This process is commonly carried on in the winter, and the gravel is sluiced in the spring and summer. The laws of the Dominion, under which claims are obtained, are very complicated, and have been changed many times since the opening of the district. At present they permit the location of claims 250 feet long, with the full width of the gulch, or, on rivers, with the half width of the valley. Terrace claims are 250

Church, Bishop Magee, Croom Robertson, FitzJames Stephen, Sylvester, J. C. Bucknill, Andrew Clark, W. K. Clifford, St George Mivart, M. Boulton, Lord Selborne, John Morley, Leslie Stephen, F. Pollock, Gasquet, C. B. Upton, William Gull, Robert Clarke, A. J. Balfour, James Sully, and A. Barratt.

Papers were read and discussed at the various meetings on such subjects as the ultimate grounds of belief in the objective and moral sciences, the immortality of the soul, &c. An interesting description of one of the meetings was given by Magee (then Bishop of Peterborough) in a letter of 13th February 1873:—

feet square. Every alternate claim belongs to the Government, and a certain percentage, formerly 10 per cent. of the gross products of the claim, is paid to the Government. Aliens, as well as citizens, may take up mining claims. In 1901 the population of the city of Dawson was 9142. (H. G*.)

Knowles, James (1831—), English architect and editor, was born in London in 1831, and was educated, with a view to following his father's profession as an architect, at University College and in Italy. His literary tastes also brought him at an early age into the field of authorship. In 1860 he published *The Story of King Arthur*. In 1867 he was introduced to Tennyson, whose house, "Aldworth," on Blackdown, he designed; this led to a close friendship, Mr Knowles assisting Tennyson in business matters, and among other things helping to design scenery for *The Cup*, when Irving produced that play in 1880. Mr Knowles became intimate with a number of the most interesting men of the day, and in 1869, with Tennyson's co-operation, he started the "Metaphysical Society," the object of which was to attempt some intellectual rapprochement between Religion and Science by getting the leading representatives of Faith and Unfaith to meet and exchange views.

The members from first to last were as follows:—Dean Stanley, Seeley, Roden Noel, Martineau, W. B. Carpenter, Hinton, Huxley, Pritchard, Hutton, Ward, Bagehot, Froude, Tennyson, Tyndall, Alfred Barry, Lord Arthur Russell, Gladstone, Manning, Knowles, Sir John Lubbock, Alford, Alex. Grant, Bishop Thirlwall, F. Harrison, Father Dalgairns, Sir G. Grove, Shadworth Hodgson, H. Sidgwick, E. Lushington, Bishop Eliott, Mark Pattison, duke of Argyll, Ruskin, Robert Lowe, Grant Duff, Greg, A. C. Fraser, Henry Acland, Maurice, Archbishop Thomson, Mozley, Dean

Archbishop Manning in the chair was flanked by two Protestant bishops right and left; on my right was Hutton, editor of the *Spectator*, an Arian; then came Father Dalgairns, a very able Roman Catholic priest; opposite him Lord A. Russell, a Deist; then two Scotch metaphysical writers, Free-thinkers; then Knowles, the very broad editor of the *Contemporary*; then, dressed as a layman and looking like a country squire, was Ward, formerly Rev. Ward, and earliest of the perverts to Rome; then Greg, author of *The Creed of Christendom*, a Deist; then Froude, the historian, once a deacon in our Church, now a Deist; then Roden Noel, an actual Atheist and red republican, and looking very like one! Lastly Ruskin, who read a paper on miracles, which we discussed for an hour and a half! Nothing could be calmer, fairer, or even, on the whole, more reverent than the discussion. In my opinion, we, the Christians, had much the best of it. Dalgairns, the priest, was very masterly; Manning, clever and precise and weighty. Froude, very acute, and so was Greg. We only wanted a Jew and a Mahomedan to make our Religious Museum complete (*Life*, vol. i. p. 284).

The last meeting of the Society was held on 16th May 1880. Huxley said that it died "of too much love"; Tennyson, "because after ten years of strenuous effort no one had succeeded in even defining Metaphysics." According to Dean Stanley, "We all meant the same thing if we only knew it." The Society formed the nucleus of the distinguished list of contributors who supported Mr Knowles in his capacity as an editor. In 1870 he became associated with the *Contemporary Review*, but left it in 1877 and founded the *Nineteenth Century* (to the title of which, in 1901, were added the words *And After*). Both periodicals became very influential under him, and formed the type of the new sort of monthly Review which came to occupy the place formerly held by the Quarterlies.

Knoxville, capital of Knox county, Tennessee, U.S.A., on the north bank of the Tennessee, at an altitude of 891 feet. It is the chief city of the valley of east Tennessee, and is third in size in that state. Its site is undulating and its plan irregular; it is well built, is divided into 11 wards, and is paved with brick and macadam. It is on two railways, the Southern and the Atlanta, Knoxville and Northern. It is near the famous marble quarries of east Tennessee, and it has large and rapidly increasing iron manufactures. In 1900 its manufacturing establishments numbered 218, with a total capital of \$5,151,130. They employed 4714 hands, and the product was valued at \$6,943,595. The University of Tennessee, situated here, was opened in 1794, and had in 1899, 65 professors and other instructors and 670 students, 75 of whom were women. Knoxville College, a Presbyterian institution founded in 1875, had in 1899, 23 instructors and 264 students. The assessed valuation of real and personal property in 1900 was \$11,210,200; the net debt was \$1,407,191; and the rate of taxation was \$24.80 per \$1000. Population (1880), 9693; (1890), 22,535; (1900), 32,637—895 foreign-born and 7359 negroes.

Knutsford, an ancient market town and parish in the Knutsford parliamentary division of Cheshire, England, 24 miles east-north-east of Chester by rail. Over Knutsford was in 1894 incorporated with the township of Knutsford. The grammar school was reorganized in 1885, the present building dating from 1887. There are, besides, the Egerton Schools, erected by Lord Egerton (1893), a market hall, a literary institute, and a sessions-house. The town (which is the "Cranford" of Mrs Gaskell's novel of that name) and its outskirts are the residence of many Manchester merchants. Its industries comprise cotton, worsted, and leather manufactures. Area of Knutsford, including Nether and Over Knutsford, 1760 acres. Population (1881), 4305; (1891), 4643; (1901), 5172. Knutsford was the birthplace in 1788 of Sir Henry Holland, Bart., the famous physician and writer; and in 1888 its name was taken for his title by his son, the second Sir Henry Holland, 1st BARON KNUTSFORD (1825—), who was Secretary of State for the Colonies from 1887 to 1892.

Kobdo, a town of the Chinese Empire, north-west Mongolia, at the northern foot of the Mongolian Altai, on the right bank of the Buyantu river, 13 miles from its entrance into Lake Khara-usu; 500 miles east-south-east of Biysk (Russian), and 470 miles west of Ulyasutai. It is situated amidst a dreary plain, and consists of a fortress, the residence of the governor of the Kobdo district, and a small trading town, chiefly peopled by Chinese and a few Mongols. It is, however, an important centre for trade between the cattle-breeding nomads and Peking. It was founded by the Chinese in 1731, and pillaged by the Musulmans in 1872. The district of KOBDO occupies the north-western corner of Mongolia, and is peopled chiefly by Mongols, and also by Kirghiz and a few Soyotes, Uryankhais, and Khotons. It is governed by a Chinese commissioner, who has under him a special Mongol functionary (Mongol, *dzurgan*). The chief monastery is at Ulangom. Considerable numbers of sheep (about 1,000,000), sheepskins, sheep and camel wool are exported to China, while Chinese cottons, brick tea, and various small goods are imported. Leather, velveteen, cotton, iron and copper goods, boxes, &c., are imported from Russia in exchange for cattle, furs, and wool. The absence of a cart road to Biysk hinders the development of this trade.

Koch, Robert (1843—), German bacteriologist, was born at Klausthal, Hanover, on 11th December 1843. He studied medicine at Göttingen, and it was while he was practising as a physician at Wallstein that he began those bacteriological researches that have made his name famous. In 1876 he obtained a pure culture of the anthrax bacillus, announcing a method of preventive inoculation against that disease seven years later. In 1882, largely as the result of the improved methods of bacteriological investigation he was able to elaborate, he discovered the bacillus of tuberculosis; and in the following year, having been sent on an official mission to Egypt and India to study the ætiology of Asiatic cholera, he identified the comma bacillus as the specific organism of that malady. In 1890 great hopes were aroused by the announcement that in tuberculin he had prepared an agent which exercised an inimical influence on the growth of the tubercle bacillus, but the expectations that were formed of it as a remedy for consumption were not fulfilled, though it came into considerable vogue as a means of diagnosing the existence of tuberculosis in animals intended for food. But even its utility in this respect would be nullified if it should be found, as he stated at the Congress on Tuberculosis held in London in 1901, that tuberculosis in man and in cattle is not the same disease, and is not transmissible from one to the other. This statement, however,

was not regarded as properly proved, and pending further inquiry is regarded with general scepticism. Dr Koch also investigated the nature of rinderpest in South Africa in 1896, and of bubonic plague in India in the following year. He became a member of the Sanitary Commission at Berlin and a professor at the School of Medicine in 1880.

Koesfeld, a town of the province of Westphalia, Prussia, 38 miles by rail north-north-west of Dortmund. Here are the ruins of the Ludgeri Castle, formerly the residence of the bishops of Münster (19 miles to the east), and also the castle of Varlar the residence of the counts of Salm-Horstmar. The leading industries include mixed linen goods, woven and dyed, saw-mills, &c. Population (1900), 7445.

Köflach, a market-place in the government district of Voitsberg, 17 miles west of Gratz, in Styria, Austria. It is the centre of an extensive lignite deposit and of a number of iron-works. There are about 4000 hands employed in the mines, the annual product amounting to 700,000 tons of lignite. There are also some tanning, glass-making, and brewing, and the manufacture of cellulose, together with a number of saw-mills. Population (1890), 2927; (1900), 3345, chiefly German.

Kohat, a town and district of British India, in the Peshawur division of the Punjab. The town is 37 miles south of Peshawur by the Kohat pass, along which a military road was opened in 1901. Population (1881), 18,179; (1891), 27,003; municipal income (1897-98), Rs.48,701. In the Tirah campaign of 1897-98 Kohat was the headquarters of the expedition that operated against the Orakzais and Afridis. The district of KOHAT has an area of 2771 square miles; population (1881), 181,540; (1891), 203,175; average density, 73 persons per square mile. In 1901 the population was 218,174, showing an increase of 7 per cent. The land revenue and rates were Rs.1,42,144, the incidence of assessment being Rs.0:6:9 per acre; cultivated area (1896-97), 218,516 acres, of which 39,166 were irrigated; number of police, 457; number of schools (1896-97), 58, with 1437 pupils, the proportion of boys at school to male population of school-going age being 5·2 per cent.; registered death-rate (1897), 22·90 per thousand. The salt-mines produced in 1897-98 salt to the amount of 322,404 maunds, yielding a net revenue of Rs.3,85,955. In July 1896 the rate of duty was raised from 8 annas to Rs.2 per maund, the standard rate for the rest of India. There are no railways in the district, nor any Government canals. The length of metalled roads is 94 miles, and the Indus is navigable for 84 miles.

Kokomo, capital of Howard county, Indiana, U.S.A., on the Wildcat river, and on the Lake Erie and Western, the Pittsburg, Cincinnati, Chicago and St Louis, and the Toledo, St Louis and Kansas City railways, at an altitude of 821 feet. It is in an agricultural region, and produces a variety of manufactured goods. Population (1880), 4042; (1890), 8261; (1900), 10,609, of whom 499 were foreign-born and 359 negroes.

Kolaba, a district of British India, in the Konkan division of Bombay. It includes the hill fort of Raigarh, Sivaji's capital. The headquarters are at Alibag; population (1891), 5888. Since the census of 1891 the district has been enlarged by the transfer of about 200 villages from Thana. Present area, 2128 square miles; population (1891), 594,872; average density, 279 persons per square mile. In 1901 the population was 605,165, showing an increase of 2 per cent. The land revenues and rates were Rs.17,30,703, the incidence of assessment being

R.1: 11:10 per acre; cultivated area (1897-98), 393,819 acres, of which 2418 were irrigated from wells, &c.; number of police, 558; children at school (1897-98), 10,060, being 1.9 per cent. of the total population; registered death-rate (1897), 37.87 per thousand. The staple crop is rice. A considerable number of the people support themselves by fishing, and the forests yield valuable timber and other produce. Salt is largely made along the coast by evaporation. There are five printing-presses, and two vernacular newspapers. There is no railway, but communication with Bombay is maintained by a steam ferry. Owing to its proximity to Bombay, the district has suffered severely from plague. Down to July 1898, the total number of deaths reported from plague was 1834. Kolaba district takes its name from a little island off Alibag, which was one of the strongholds of Angria, the Mahratta admiral of the 18th century. The same island has given its name to Kolaba Point, the spur of Bombay Island running south that protects the entrance to the harbour. On Kolaba Point are the terminus of the Bombay and Baroda railway, European barracks, lunatic asylum, and observatory.

Kolar, a town and district of India, in the native state of Mysore. The town is 43 miles east of Bangalore. Population (1881), 11,172; (1891), 12,148. The district of KOLAR has an area of 2845 square miles; population (1881), 461,129; (1891), 591,030, showing an increase of 28 per cent.; average density, 193 persons per square mile. In 1901 the population was 722,751, showing a further increase of 22 per cent. The district is traversed by the Bangalore line of the Madras railway, with a branch 10 miles long, known as the Kolar Goldfields railway. Gold prospecting in this region first began in 1876, and the industry is now settled on a secure basis. Here are situated the mines of the Mysore, Champion, Ooregum, Nundydroog, and other companies, which are among the most profitable in the world. In 1898 the total out-turn exceeded 400,000 ounces, yielding to the Mysore state Rs.13,14,560 in rent and royalties. The municipality called the Gold Fields had in 1901 a population of 37,964. It has suffered severely from plague. Electricity from the falls of the Cauvery (93 miles distant) will be used as the motive power in the mines. The capital expenditure on this work is estimated at £288,000.

Kolbe, Hermann (1818-1884), German chemist, was born on 27th September 1818 at Elliehausen, near Göttingen, where in 1838 he began to study chemistry under Wöhler. In 1842 he became assistant to Bunsen at Marburg, and three years later to Playfair at the School of Mines, London. From 1847 to 1851 he was engaged at Brunswick in editing the *Dictionary of Chemistry* started by Liebig, but in the latter year he went to Marburg as successor to Bunsen in the chair of chemistry. In 1865 he was called to Leipzig in the same capacity, and he died in that city on 25th November 1884. Kolbe had an important share in the great development of chemical theory that occurred about the middle of last century, especially in regard to the constitution of organic compounds, which he viewed as derivatives of inorganic ones, formed from the latter—in some cases directly—by simple processes of substitution. Unable to accept Berzelius's doctrine of the unalterability of organic radicals, he also gave a new interpretation to the meaning of copulæ under the influence of his fellow-worker Frankland's conception of definite atomic saturation-capacities, and thus contributed in an important degree to the subsequent establishment of the structure theory. Kolbe was a very successful teacher, a ready and vigorous writer, and a brilliant experimentalist whose work revealed the nature of many compounds the composition of which had not previously been understood.

Kolberg, or COLBERG, a seaport town and sea-side resort of Prussia, province of Pomerania, 81 miles by rail north-east of Stettin, near the shore of the Baltic. Except on the side next the sea, its fortifications were razed in 1873. The church of St Mary (begun in 1258 and restored in 1890) is a good Gothic building of brick, with fine aisles and paintings, &c., of the 14th century. The sea-bathing, and brine and mud baths, attract from 10,000 to 11,000 visitors annually. Sea-fishing, wool-spinning, brewing, saw-milling, manufacture of tobacco, and iron-founding are the chief industries. The harbour is 16 feet deep; its entrance, 15 feet. Population (1885), 16,557; (1900), 20,241.

Kolding, a market town of Denmark, county of Vejle, 13 miles by rail west by south of Fredericia. The ruins of the castle have been converted into an antiquarian and historical museum (1892). There are large slaughter-yards for killing cattle for export. In 1899 the port was entered by 1131 vessels of 82,668 tons, and cleared by 1172 of 91,257 tons. The chief imports are iron, coal, and groceries. The harbour throughout has a depth of over 20 feet. Population (1880), 7141; (1890), 9658; (1900), 12,516.

Kolhapur, a native state of India, within the Deccan division of Bombay. Together with its *jagirs* or feudatories, it covers an area of 2816 square miles; population (1881), 800,189; (1891), 913,131, showing an increase of 14 per cent.; average density, 324 persons per square mile. In 1901 the population was 910,175. The estimated gross revenue is Rs.45,70,000; military force, 700 officers and men. In recent years the state has been conspicuously well governed, on the pattern of British administration. The present raja, Shahu Chhatrapati, G.C.S.I., is entitled to a salute of 19 guns. In 1897-98 the net revenue was Rs.18,09,389, and the expenditure Rs.22,53,421, of which Rs.5,92,555 was devoted to public works, Rs.2,48,145 to famine relief, and Rs.1,39,025 to education. There were 227 schools, with 13,830 pupils; and 16 dispensaries. The principal institutions are the Rajaram College, with 116 students; the high school, with 334 pupils; a technical school; an agricultural school; and training-schools for both masters and mistresses. The state railway from Miraj junction to Kolhapur town, 30 miles, is worked by the Southern Mahratta line. In recent years the state has suffered from both famine and plague. The town of KOLHAPUR, or Karvir, is situated in 16° 42' N. and 74° 16' E., the terminus of a branch of the Southern Mahratta railway, 30 miles from the main line. Population (1881), 38,599; (1891), 45,815; municipal income (1897-98), Rs.59,503.

Kölliker, Rudolph Albert (1817-—), Swiss anatomist and physiologist, was born at Zürich on 6th July 1817. His father and his mother were both Zürich people, and he in due time married a lady from Aargau, so that Switzerland can claim him as wholly her own, though he has lived the greater part of his life in Germany. His early education was carried on in Zürich, and he entered the university there in 1836. After two years, however, he moved to the University of Bonn, and later to that of Berlin, becoming at the latter place the pupil of Johannes Müller and of Henle. He graduated in philosophy at Zürich in 1841, and in medicine at Heidelberg in 1842. The first academic post which he held was that of prosector of anatomy under Henle; but his tenure of this office was brief, for in 1844 his native city called him back to its university to occupy a chair as professor extraordinary of physiology and comparative anatomy. His stay here too, however, was brief, for in 1847 the University of Würzburg, attracted by his rising fame, offered him the post of

professor of physiology and of microscopical and comparative anatomy. He accepted the appointment, and at Würzburg he remained thenceforth, refusing all offers tempting him to leave the quiet academic life of the Bavarian town.

Kölliker's name will ever be associated with that of the tool with which during his long life he so assiduously and successfully worked, the microscope. The time at which he began his studies coincided with that of the revival of the microscopic investigation of living beings. Two centuries earlier the great Italian Malpighi had started, and with his own hand had carried far, the study, by the help of the microscope, of the minute structure of animals and plants. After Malpighi this branch of knowledge, though continually progressing, made no remarkable bounds forward until the second quarter of the 19th century, when the improvement of the compound microscope on the one hand, and the promulgation by Schwann and Schleiden of the "cell theory" on the other hand, inaugurated a new era of microscopic investigation, which has lasted until the present day. Into this new learning Kölliker threw himself with all the zeal of youth, wisely initiated into it by his great teacher Henle, whose sober and exact mode of inquiry went far at the time to give the new learning a right direction and to counteract the somewhat fantastic views which, under the name of the cell theory, were tending to be prominent. Henle's labours were for the most part limited to the microscopic investigation of the minute structure of the tissues of man and of the higher animals, the latter being studied by him mainly with the view of illustrating the former. But Kölliker had another teacher besides Henle, the even greater Johannes Müller, whose active mind was sweeping over the whole animal kingdom, striving to pierce the secrets of the structure of living creatures of all sorts, and keeping steadily in view the wide biological problems, of function and of origin, which the facts of structure might serve to solve. We may probably trace to the influence of these two great teachers, strengthened by the spirit of the times, the threefold character of Kölliker's long-continued and varied labours. In all of them, or in almost all of them, the microscope has been the instrument of inquiry, but the problem to be solved by means of the instrument has belonged now to one branch of biology, now to another.

At Zürich, and afterwards at Würzburg, the title of the chair which he held laid upon him the duty of teaching comparative anatomy, and very many of the numerous memoirs which he published, including the very first paper which he wrote, and which appeared in 1841 before he graduated, "On the Nature of the so-called Seminal Animalcules," are directed towards elucidating, by help of the microscope, the structure of animals of the most varied kinds—that is to say, are zoological in character. Notable among these are his papers on the Medusæ and allied creatures. His activity in this direction led him to make zoological excursions in the Mediterranean Sea and on the coasts of Scotland, as well as to undertake, conjointly with his friend Siebold, the editorship of the *Zeitschrift für Wissenschaftliche Zoologie*, which, founded in 1848, continued, under his hands, to be one of the most important zoological periodicals.

At the time when Kölliker was beginning his career, the influence of von Baer's embryological teaching was already being widely felt. Men were learning to recognize the importance to morphological and zoological studies of a knowledge of the development of animals; and Kölliker plunged with enthusiasm into the relatively new line of inquiry. His earlier efforts were directed to the invertebrata, and his memoir on the development of cephalopods, which appeared in 1844, is a classical work; but he soon passed on to the vertebrata, and studied not only

the amphibian embryo and the chick, but also the mammalian embryo. He was among the first, if not the very first, to introduce into this branch of biological inquiry the newer microscopic technique—the methods of hardening, section-cutting, and staining. By doing so, not only was he enabled to make rapid progress himself, but he also placed in the hands of others the means of a like advance. The remarkable strides forward which embryology made during the middle and during the latter half of the 19th century will always be associated with his name. His *Lectures on Development*, published in 1861, at once became a standard work.

But neither zoology nor embryology furnishes Kölliker's chief claim to fame. If he has done much for these branches of science, he has done still more for histology, the knowledge of the minute structure of the animal tissues. This he made emphatically his own. It may indeed be said that there is no fragment of the body of man and of the higher animals on which he has not left his mark, and in more places than one his mark has been a mark of fundamental importance. Among his earlier results may be mentioned the demonstration in 1847 that smooth or unstriated muscle is made up of distinct units, of nucleated muscle-cells. In this work he followed in the footsteps of his master Henle. A few years before this, men were doubting whether arteries were muscular, and no solid histological basis as yet existed for those views as to the action of the nervous system on the circulation which were soon to be put forward, and which have since had such a great influence on the progress of physiology. By the above discovery Kölliker completed that basis.

Even to enumerate, certainly to dwell on, all his contributions to histology would be unfitting here: smooth muscle, striated muscle, skin, bone, teeth, blood-vessels, and viscera were all investigated by him; and he touched none of them without striking out some new truths. The results at which he arrived are recorded partly in separate memoirs, partly in his great text-book on microscopical anatomy, which first saw the light in 1850, and by which he has advanced histology no less than by his own researches. In the case almost of every tissue our present knowledge contains something great or small which we owe to Kölliker; but it is on the nervous system that his name is written in largest letters. So early as 1845, while still at Zürich, he supplied what was as yet still lacking, the clear proof that nerve-fibres are continuous with nerve-cells, and so furnished the absolutely necessary basis for all sound speculations as to the actions of the central nervous system. From that time onward he continually laboured, and always fruitfully, at the histology of the nervous system, and more especially at the difficult problems presented by the intricate patterns in which fibres and cells are woven together in the brain and spinal cord. In his old age, at a time when he had fully earned the right to fold his arms and to rest and be thankful, he still enriched neurological science with results of the highest value. From his early days a master of method, he saw at a glance the value of the new Golgi method for the investigation of the central nervous system, and, to the great benefit of science, took up once more in his old age, with the aid of a new means, the studies for which he had done so much in his youth. It may truly be said that much of that exact knowledge of the inner structure of the brain, which is rendering possible new and fruitful conceptions of its working, has come from his hands.

Lastly, Kölliker was in his earlier years professor of physiology as well as of anatomy; and not only did his histological labours almost always carry physiological lessons, but he also enriched physiology with the

results of direct researches of an experimental kind, notably those on urari and some other poisons. In fact, we have to go back to the science of centuries ago to find a man of science of so many-sided an activity as he. His life constituted in a certain sense a protest against that specialized differentiation, which, however much it may under certain aspects be regretted, seems to be one of the necessities of modern development. In Johannes Müller's days no one thought of parting anatomy and physiology; nowadays no one thinks of joining them together. Kölliker did in his work join them together, and indeed said himself that he thought they ought never to be kept apart.

Naturally a man of so much accomplishment was not left without honours. Formerly known simply as Kölliker, the title "von" was added to his name. He was made a member of the learned societies of many countries; in England, which he visited more than once, and where he became well known, the Royal Society made him a fellow in 1860, and in 1897 gave him its highest token of esteem, the Copley medal.

Koło, a district town of Russian Poland, government and 46 miles north-east of Kalisz, on an island of the Warta. It has several factories, and china and pottery works. Population (1897), 9400.

Kolomea (Polish, *Kołomyja*), the chief town of a district of the same name, on the Pruth, 45 miles north-west of Czernowitz, in the Austrian province of Galicia. The population in 1900 was 34,188, half Jews, the rest Poles and Ruthenians.

Kolomna, a district town of Russia, on the right bank of the Moskva, government of Moscow, 72 miles by rail from the capital. It has several old churches of great archaeological interest. Since it was connected by rail with Moscow its trade importance has decreased, but it remains an entrepôt for grain, coal, and timber; its factories (silk, saw-mills, rope-mills), however, have grown considerably. Population (1897), 20,970.

Kolozsvár (KLAUSENBURG), a municipal town of Hungary, capital of the county of Kolozs, on the Szamos, 80 miles east by south of Nagy-Várad (*Grosswardein*). The Transylvanian Hungarian Association for Public Culture, situated here, has 20,000 members and property worth 3 million crowns. The house of the Hungarian king, Matthias Corvinus, still stands in good preservation, and contains an ethnographical museum. On the chief square there is an equestrian statue of this famous king, a work of the Hungarian sculptor Fadrusz. Population (1890), 32,756; (1900), 49,295.

Kolpino, one of the chief iron-works of the Crown in Russia, government and 16 miles south-east of St Petersburg, on the railway to Moscow, and on the Izhora river. Over 5000 tons of iron, as also steel and copper goods, are turned out every year. Population (1897), 8076.

Kolyvañ.—1. A town of Russia, West Siberia, government and district of Tomsk, on the Chaus river, 5 miles from the Ob. It is a wealthy town, the merchants carrying on a considerable export trade in cattle, hides, tallow, corn, and fish. It was founded in 1713 under the name of Chausky Ostrog, and has rapidly grown. Population (1897), 11,703. 2. KOLYVAÑSKIY ZAVOD, another town of the same government, district of Biysk, Altai region, on the Byelaya river, 192 miles south-east of Barnaul; altitude, 1290 feet. It is renowned for its stone-cutting factory, where marble, jasper, various porphyries and breccias are worked into vases, columns, &c. Popu-

lation, 5000. 3. Old name of Reval, founded by Yaroslav Vsevolodovich in 1233.

Komárom (German, *Komorn*), a municipal town of Hungary, capital of the county of the same name, on the left bank of the Danube, 48 miles west-north-west of Budapest. Since 1896 it has been united with Uj-Szöny. In 1896 a statue of General George Klapka (1820-1892) was erected, in memory of his brilliant defence of the town against the Austrians in the Hungarian revolution. It is the birthplace of the novelist Maurus Jókai. Population (1891), 13,076; (1900), 20,264.

Komotau (Czech, *Chomutov*), the chief town of a government district of the same name in Bohemia, at the foot of the Erzgebirge, 30 miles south-west of Aussig. Among the additions to its industry are the central workshops of the Buschtiehrad railway, the making of watches, chemicals, tin toys, silk kerchiefs, &c. Population (1890), 13,050; (1900), 15,925, almost exclusively German and Catholic.

Kongsberg, a mining town of Norway, county Buskerud, 56 miles by rail south-west of Christiania. The annual value of the output of the silver-mines averages £35,000 to £50,000. Population (1875), 4357; (1900), 5585.

Konia.—1. A viláyet in Asia Minor which includes the whole, or parts of, Pamphylia, Pisidia, Phrygia, Lycaonia, Cilicia, and Cappadocia. It is divided into five sanjaks—Adalia, Buldur, Hamid-abad, Konia, and Nigdeh. The population (900,000 Moslems and 80,000 Christians) is for the most part agricultural and pastoral. The only industries are carpet-weaving and the manufacture of cotton and silk stuffs. There are chrome mines and mines of argentiferous lead and rock salt. The principal exports are salt, opium, cotton, cereals, wool, and live stock; and the imports cloth goods, coffee, rice, and petroleum. 2. The chief town of the above, the ancient *Iconium*, altitude 3320 feet, situated at the south-west edge of the vast central plain of Asia Minor, amidst luxuriant orchards watered by streams from the hills. There are interesting remains of Seljúk buildings, all showing strong traces of Persian influence in their decorative details. The most important mosque is the great Türbe, which contains the tombs of Mevlana Jelal ed-dín, founder of the order of Mevlevi (whirling) dervishes, and of his successors. The climate is good—hot in summer and cold, with snow, in winter. The population of 45,000 includes 5000 Christians. Konia is connected by railway with Smyrna, and *via* Eski-shehr with Constantinople. After the capture of Nicæa by the Crusaders (1097), Konia became the capital of the Seljúk Sultans of Rûm. It was temporarily occupied by Godfrey, and again by Frederick Barbarossa, but this scarcely affected its prosperity. During the reign of Ala ed-dín I. (1219-36) the city was thronged with artists, poets, historians, jurists, and dervishes, driven westwards from Persia and Bokhara by the advance of the Mongols, and there was a brief period of great splendour. In 1472 it was annexed, with Karamania, to the Osmanli Empire by Muhammad II. In 1832 it was occupied by Ibrahim Pasha.

See RAMSAY. *Historical Geography of Asia Minor*; St Paul the Traveller.—MURRAY. *Handbook to Asia Minor*.

König, Karl Rudolph (1832-1901), physicist, was born at Königsberg (Prussia) on 26th November 1832, and studied at the university of his native town, taking the degree of Ph.D. About 1852 he went to Paris, and became apprentice to the famous violin-maker, J. B. Vuillaume, and some six years later he started business on his own account. He called himself a "maker of musical instruments," but the instruments for which

his name is best known are tuning-forks, which speedily gained a high reputation among physicists for their accuracy and general excellence. From this business König derived his livelihood for the rest of his life. He was, however, very far from being a mere tradesman, and even as a manufacturer he regarded the quality of the articles that left his workshop as a matter of greater solicitude than the profits they yielded. Acoustical research was his real interest, and to that he devoted all the time and money he could spare from his business. An exhibit which he sent to the London Exhibition of 1862 gained a gold medal, and at the Philadelphia Exposition of 1876 great admiration was expressed for a tonometric apparatus of his manufacture. This consisted of about 670 tuning-forks, of as many different pitches, which extended over four octaves, and it afforded a perfect means for testing, by enumeration of the beats, the number of vibrations producing any given note and for accurately tuning any musical instrument. An attempt was made to secure this apparatus for the University of Pennsylvania, and König was induced to leave it behind him in America on the assurance that it would be purchased; but ultimately, the money not being forthcoming, the arrangement fell through, to his great disappointment and pecuniary loss. Some of the forks he disposed of to the University of Toronto, where they now are. The remainder he used as a nucleus for the construction of a still more elaborate tonometer. While the range of the old apparatus was only between 128 and 4096 vibrations a second, the lowest fork of the new one only made 16 vibrations a second, while the highest gave a sound too shrill to be perceptible by the human ear. König will also be remembered as the inventor and constructor of many other beautiful pieces of apparatus for the investigation of acoustical problems, among which may be mentioned his wave-sirens, the first of which was shown at Philadelphia in 1876. His original work dealt, among other things, with Wheatstone's sound-figures, the characteristic notes of the different vowels, manometric flames, &c.; but perhaps the most important of his researches are those devoted to the phenomena produced by the interference of two tones, in which he controverted the views of Helmholtz as to the existence of summation and difference tones. He died in Paris on 2nd October 1901.

Königgrätz, a royal circuit town and episcopal seat in Bohemia, Austria, 12 miles north of Pardubitz, which was fortified up to 1884. Population (1890), 7816; (1900), 9773, chiefly Czech. A garrison numbering 2256, composed of three battalions of infantry and a regiment of artillery, is stationed here. There are four Czech high schools, and the industry includes the manufacture of machinery, colours, and *carton-pierre*, as well as gloves and wax candles. Numerous monuments (Austrian, Saxon, and Prussian) have been erected in various parts of the battlefield of 3rd July 1866, still frequently referred to as the battle of Sadowa.

Königinhof (Czech, *Králové Dvůr*), the chief town of a government district in north-east Bohemia, Austria, 21 miles east of Gitschin. Population (1890), 8635; (1900), 10,601, Czech. The chief industries are cotton-weaving, yarn-spinning, brewing, sugar-refining, tanning, corn-milling, and the sawing of timber.

The controversy concerning the genuineness of the "Königinhof MSS.," containing specimens of old Czech epic and lyric poetry, dating from the 13th century (see *Ency. Brit.* xi. 440), would now appear to have been finally decided in the negative by a consensus of Czech and German philologists. The former include the Czech university professors Masaryk, Gebauer, and Goll, and the latter, Wattenbach, Büdinger, and Feifalik. (See articles by Gebauer in the *Archiv für Slav. Philologie*, x.-xi., and his

Poučení o padělaných rukopisích Královédvorském a Zelenohorském (Prague, 1889); Knieschek, *Die Streit über die Königinhofer und Grüneberger Handschrift* (Prague, 1888), and the *Deutsche Zeitschrift für Geschichtswissenschaft*, 1889-90.) In December 1899 there was an alleged discovery, in the 62nd line of the "Judgment of Libussa," of a cryptical confession of the authorship by Wenceslaus Hanka himself. This particular line of the poem contains only two words, the remainder consisting of a number of single coloured letters, of which every second is reversed. These were described as "strange characters" by Palacky, the celebrated Bohemian historian, who regarded them as a kind of trifling on the part of the transcriber. It is now reported that they have been deciphered by Professor Ladislaus Dolansky as "V. H. A. N. K. A. F. E. C. I. T.," that is to say, "V. Hanka fecit." (Æ. O'N.)

Königsberg, a town of Prussia, capital of the province of East Prussia, the second capital of the kingdom of Prussia, a first-class fortress, and headquarters of the 1st German Army Corps, on hilly ground on both banks of the river Pregel, 4½ miles above its entrance into the Frisches Haff. Königsberg owes its position as capital to the fact that the first king of Prussia, Frederick I., in 1701 crowned himself in this city, because it stood outside the empire, and thus gave him the standing of a fully independent sovereign. The defensive works consist principally of a dozen outer forts, which in both plan and equipment answer to the rigorous requirements of modern warfare. The city possesses two ornamental sheets of water—the Schloss Teich and the Ober Teich—the former within and the latter without the old ring of fortifications. The suburb of Hufan, outside the western Steindammer, is a favourite pleasure resort, amongst its attractions being the zoological gardens. The conspicuous new buildings embrace the administrative offices (1882) in the Italian Renaissance style, the synagogue, the imposing Palæstra Albertina (a species of gymnasium, 1898), the gift of Dr Lange of New York, and various offices (railway, &c.). In addition to the older monuments to Frederick I. and Kant, there have been added a bronze statue of Duke Albert (1891) and another of the Emperor William I. (1894), both by Reusch. Königsberg is well equipped with museums and similar institutions, the most noteworthy being the Prussia Museum of Antiquities (specially rich in East Prussian finds from the Stone Age to the Viking period) and the archives (both these in the castle), the industrial art and technical museum, the collection of the sculptor Siemering's works in the Altstadt town hall, the astronomical observatory, botanical gardens, zoological museum, physical institute, mineralogical-geological institute, the collections of the physical-economical society, the chemical laboratory, the architectural school, and several medical institutes. In 1900-01 the university was attended by 874 students, and had about 120 professors. The tomb of Kant is in the cathedral. Industries have made a great advance; besides those previously mentioned, there are printing works and manufactories of chemicals and artificial manure, toys, sugar, cellulose, and wood-pulp, tobacco, pianos, and amber wares. A new channel has been made (1901), at the cost of £615,000, between Königsberg and Pillau, its port, 29 miles distant, on the outer side of the Frisches Haff, so as to admit vessels drawing 20 feet right up to Königsberg, and the result has been greatly to quicken the trade of the city. It is protected for a long distance by moles, in which a break has been left in the Fischhauser Wiek, to permit of freer circulation of the water and for the prevention of damage to the mainland. The following are the principal exports of the port:—Cereals and flour (average annual value, £1,250,000), hemp (£600,000), flax (£600,000), timber (£420,000), sugar (£152,000), hemp tow (£152,000), oil-cakes (£240,000), and rags (£60,000). The total trade amounted in 1899 to £10,000,000, of which £4,100,000 was the value of the exports, and £5,900,000

the value of the imports; as compared with £7,525,000 for exports, and £8,950,000 for imports in 1886, or £16,475,000 altogether. Since 1894, when 2173 vessels of 910,825 tons cleared, there has been a decline in the overseas shipping, namely, to 1520 vessels of 367,150 tons in 1899. There is in addition a river traffic of between 300,000 and 350,000 tons annually. Population (1885), 151,151; (1890), 161,666; (1900), 187,897.

Königshütte, a town of Prussia, province of Silesia, 3 miles south of Beuthen and 122 miles by rail south-east of Breslau. It lies in the centre of coal mines, ironworks, and zinc works, and has also manufactures of bricks, roofing paper, and turnery, flour-mills and saw-mills. Population (1885), 32,072; (1900) 57,875.

Königswinter, a town and summer resort of Prussia, in the Rhine province, on the right bank of the Rhine, 24 miles south-south-east of Cologne by rail, at the foot of the Siebengebirge and the romantic Drachenfels (ascended by a toothed railway). Many of the inhabitants are stone-dressers, the stone (trachyte) being quarried close by. Population (1900), 3804.

Konotop, a district town of Russia, government and 83 miles east-south-east of Chernigov, on the Kieff-Kursk railway. It has trade in grain and other agricultural produce. Population (1897), 23,083.

Konstantinovskaya, a Cossack village, Russia, province of Don Cossacks, on the right bank of the Don, 48 miles east of Novocherkask. It is the seat of district administration of the first Don district, and has an important cattle fair. Population (1897), 10,700.

Kooringa, or BURRA, a town of South Australia, in a mining and agricultural district, in the county of Burra, on Burra Creek, 101 miles by rail north by east of Adelaide. The Burra Burra copper-mine is in the immediate neighbourhood. Two iron bridges across the creek connect the town with Baldina and the eastern plains. Large areas in the district are devoted to wheat-growing. Population (1901), 1994.

Kopp, Hermann Franz Moritz (1817–1892), German chemist, was born on 30th October 1817 at Hanau, where his father practised as a physician. After attending the gymnasium of his native town, he studied at Marburg and Heidelberg, and then, attracted by the fame of Liebig, went in 1839 to Giessen, where he became a *privat-docent* in 1841, and professor of chemistry twelve years later. In 1864 he was called to Heidelberg in the same capacity, and he remained there till his death on 20th February 1892. Kopp devoted himself especially to physico-chemical inquiries, and in the history of chemical theory his name is associated with several of the most important correlations of the physical properties of substances with their chemical constitution. Much of his work was concerned with specific volumes, the conception of which he set forth in a paper published when he was only twenty-two years of age; and the principles he established have formed the basis of subsequent investigations in that subject, although his results have in some cases undergone modification. Another question to which he gave much attention was the connexion of the boiling-point of compounds, organic ones in particular, with their composition. In addition to these and other laborious researches, Kopp was a prolific writer. In 1843–47 he published a comprehensive *History of Chemistry* in four volumes, to which three supplements were added in 1869–75. The *Development of Chemistry in Recent Times* appeared in 1873, and in 1886 he published a work in two volumes on *Alchemy in Ancient and Modern Times*. In addition he wrote on theoretical and physical chemistry

for the Graham-Otto *Lehrbuch der Chemie*, and for many years from 1851 he was acting editor of the *Annalen der Chemie*.

Korat, known officially as NAKAWN RAJA SEMA, a walled town in the Siamese province of the same name, 170 miles north-east of Bangkok, situated in 14° 59' N. and 102° 5' E. It is the administrative centre of a munton or "circle." Its position makes it the great distributing centre for the whole of the plateau lying between the Me Kong on the north and east, the forested hill ranges of Muang Lom Säk on the west, and the Dawng Praya Yen and Dawng Rek on the south-west and south. A railway from Bangkok was opened in 1900. There are a few hundred Chinese traders in and about Korat, and the total import and export trade of the whole district is calculated to amount only to £130,000. A French consular official now resides in the town by virtue of Article VIII. of the Franco-Siamese treaty. Population, about 6000.

Korea (CH'AO HSIEN, DAI HAN).—Korea is an empire of Eastern Asia, the mainland portion of which consists of a peninsula stretching southwards from the maritime province of Siberia and Chinese Manchuria, with an estimated length of about 600 miles, an extreme breadth of 135 miles,

B. V. Darbishire & O. J. R. Howarth,

Oxford, 1901.

SKETCH MAP OF KOREA.

and a coast-line of 1740 miles. It extends from 34° 18' to 43° N., and from 124° 36' to 130° 47' E. Its northern boundary, on which it is conterminous with Russia for 11 miles, is marked by the Tumen and Yalu rivers; the eastern by the Sea of Japan; the southern by the Strait of Korea; and the western by the Yalu and the Yellow Sea, down to which, from Krasnoye Celo, where three empires meet, it has China on its frontier. The south and west coasts are fringed by about 200 islands (exclusive of islets), two-thirds of which are inhabited; 100 of them are from 100

to 2000 feet in height, and many consist of bold bare masses of volcanic rock. The most important are Quelpart (*q.v.*) and the Nan Hau group. The latter, 36 miles from the eastern end of Quelpart, possesses the deep, well-sheltered, and roomy harbour of Port Hamilton, which lies between the north points of the large and well-cultivated islands of Sun-ho-dan and So-dan, which have a population of 2000. Aitan, between their south-east points, completes this noble harbour. The east coast of Korea is steep and rock-bound, with deep water and a tidal rise and fall of from 1 to 2 feet. The west coast is often low and shelving, and abounds in mud-banks, and the tidal rise and fall is from 20 to 36 feet. Korean harbours, except two or three which are closed by drift ice for some weeks in winter, are ice-free. Among them are Port Shestakoff, Port Lazareff, and Won-san in Broughton Bay; Fusan, Ma-san-po, at the mouth of the Nak-tong, on the south coast; Mok-po, Chin Nam-po, near the mouth of the Tai-dong; and Chemulpo, near the mouth of the Han, the port of the capital and the sea terminus of the first Korean railway on the west coast.

Mountains.—Korea is distinctly mountainous, and has no plains deserving the name. In the north there are mountain groups with definite centres, the most notable being Paik-tu San (8700 feet), which contains the sources of the Yalu and Tumen. From these groups a lofty range runs southwards, dividing the empire into two unequal parts. On its east, between it and the coast, which it follows at a moderate distance, is a fertile strip difficult of access, and on the west it throws off so many lateral ranges and spurs as to break up the country into a chaos of corrugated and precipitous hills and steep-sided valleys, each with a rapid, perennial stream. Farther south this axial range, which includes the Diamond Mountain group, falls away towards the sea in treeless spurs and small and often infertile levels. The northern groups and the Diamond Mountain are heavily timbered, but the hills are covered mainly with coarse, sour grass, and oak and chestnut scrub.

Rivers.—These are shallow and rocky, and are usually only navigable for a few miles from the sea. Among the exceptions are the Yalu (Amnok), Tumen, Tai-dong, Nak-tong, Mok-po, and Han. The last, rising in Kang-wön-Do, 30 miles from the east coast, cuts Korea nearly in half, reaching the sea on the west coast near Chemulpo; and, in spite of many serious rapids, is a valuable highway for commerce for over 150 miles.

Geological Formation.—The geology is little known as yet. The formations are chiefly volcanic. Extinct craters and lava fields frequently occur. Igneous rock abounds. The best soil is finely disintegrated lava. Sedimentary and organic rock is found in the west. Limestone formation occurs largely on the Han and Tai-dong rivers, and the latter is often skirted by high cliffs of coarse conglomerate, presenting a striking vertical cleavage, alternating with red sandstone. In central Korea white quartz and pink and gray granite abound.

Climate.—The climate is superb for nine months of the year, and the three months of rain, heat, and damp are not injurious to health. Koreans suffer from malaria, but Europeans and their children are fairly free from climatic maladies, and enjoy robust health. The summer mean temperature of Seoul is about 75° F., that of winter about 33°; the average rainfall, 36.3 inches in the year, and of the rainy season 21.86 inches. The rains come in July and August on the west and north-east coasts, and from April to July on the south coast, the approximate mean annual rainfall of these localities being 30, 35, and 42 inches respectively. These averages are based on the observations of seven years only.

Flora.—The plants and animals await study and classification. Among the indigenous trees are the *Abies excelsa*, *Abies microsperma*, *Pinus sinensis*, *Pinus pinea*, three species of oak, five of maple, lime, birch, juniper, mountain ash, walnut, Spanish chestnut, hazel, willow, hornbeam, hawthorn, plum, pear, peach, *Rhus vernicifera*, (?) *Rhus semipinnata*, *Acanthopanax ricinifolia*, *Zelkova*, *Thuja orientalis*, *Elaeagnus*, *Sophora Japonica*, &c. Azaleas and rhododendrons are widely distributed, as well as other

flowering shrubs and creepers, *Ampelopsis Veitchii* being universal. Liliaceous plants and cruciferæ are numerous. The native fruits, except walnuts and chestnuts, are worthless. The persimmon attains perfection, and experiment has proved the suitability of the climate to many foreign fruits. The indigenous economic plants are few, and are of no commercial value, excepting wild *ginseng*, a good root of which is worth \$15 per ounce, bamboo applied to countless uses, and "tak-pul" (*Hibiscus Manihot*), used in the manufacture of paper.

Fauna.—The tiger takes the first place among wild animals. He is of great size, his skin is magnificent, and he is so widely distributed as to be a peril to man and beast. Tiger-hunting is a profession with special privileges. Leopards are numerous, and are occasionally shot within the walls of Seoul. There are deer (at least five species), boars, bears, antelopes, beavers, otters, badgers, tiger-cats, marten, an inferior sable, striped squirrels, &c. Among birds there are black eagles, peregrines (largely used in hawking), and, specially protected by law, turkey bustards, three varieties of pheasants, swans, geese, common and spectacled teal, mallards, mandarin ducks, white and pink ibis, cranes, storks, egrets, herons, curlews, pigeons, doves, nightjars, common and blue magpies, rooks, crows, orioles, halcyon and blue kingfishers, jays, nut-hatches, redstarts, snipe, gray shrikes, hawks, kites, &c. But, pending further observations, it is not possible to say which of the smaller birds actually breed in Korea and which only make it a halting-place in their annual migrations.

Area and Population.—The estimated area is 82,000 square miles, somewhat under that of Great Britain. The first complete census was taken in 1897, and returned the population in round numbers at 17,000,000, females being in the majority. It is estimated that little more than half the arable land is under cultivation, and that the soil could support an additional 7 millions. The native population is absolutely homogeneous. In 1898 the foreign population consisted of 15,000 Japanese, 2000 Chinese, and about 400 of other nationalities, of whom 200 were Americans and nearly 100 British. This population has increased considerably since 1897, owing to the expansion of trade and the opening of new ports. Northern Korea, with its severe climate, is thinly peopled, and the rich and warm provinces of the south and west are populous. A large majority of the people are engaged in agriculture. There is no emigration, except into Russian and Chinese territory.

SEOUL (*Han-yang*), the capital, is situated in 37° 34' N. and 127° 6' E., at an altitude of 120 feet, and is distant 25 miles from Chemulpo, its seaport, and 4 from Mapu, its river-port. It lies in a basin among granite hills nowhere exceeding 2627 feet, remarkable for their denudation and their abrupt black crags and pinnacles. A well-built, crenelated stone wall from 20 to 30 feet high, about 11 miles in circuit, and pierced by 8 gateways with double-roofed gate towers, surrounds it. Its population in 1897 was 219,825, with an excess of 11,079 males. The native houses are built of stone or mud, deeply eaved, and either tiled or thatched. Above these rise the towers of the Roman Catholic cathedral, the high curved roofs of the royal audience halls, the palace gateways, and the showy buildings of the Russian and French Legations. Its antiquities are the Bell Tower, with a huge bronze bell dated 1468, a marble pagoda elaborately carved, but not of Korean workmanship, seven centuries old, and a "Turtle-Stone" of about the same date. Seoul has some wide streets of shops, hundreds of narrow alleys, and is very fairly clean. Its supply of water is bad and very limited. It has an electric tramway 4 miles long, and the Seoul and Chemulpo railway was opened in July 1900 to a station within the city. Besides being the seat of government, Seoul is the centre of education, business, and pleasure for the empire, and the residence of a large number of absentee proprietors and officials.

SONGDO (*Kaisöng*), the capital from about 910 to 1392, is a walled city of the first rank, 25 miles north of Seoul, with a population of 60,000. It possesses the stately remains of the palace of the Korean kings of the Wang dynasty, is a

great centre of the grain trade and the sole centre of the *ginseng* manufacture, makes wooden shoes, coarse pottery, and fine matting, and manufactures with sesamum oil the stout oiled paper for which Korea is famous.

PHYONG-YANG, a city on the Tai-dong, had a population of 60,000 before the war of 1894, in which it was nearly destroyed. It is fast regaining its population. It lies on rocky heights above a region of stoneless alluvium on the east, and with the largest and richest plain in Korea on the west. It has five coal mines within ten miles, and the district is rich in iron, silk, cotton, and grain. It has easy communication with the sea (its port being Chin-nampo), and is important historically and commercially. Auriferous quartz is worked by a foreign company in its neighbourhood. Near the city is the illustrated standard of land measurement cut by Ki-tze in 1124 B.C.

With the exceptions of KANG-WHA, CHONG-JU, TUNGNAI, FUSAN, WON-SAN, it is very doubtful if any other Korean towns reach a population of 15,000. The provincial capitals and many other cities are walled. Most of the larger towns are in the warm and fertile southern provinces. One is very much like another, and nearly all their streets are replicas of the better alleys of Seoul. The actual antiquities of Korea are dolmens, sepulchral pottery, and Korean and Japanese fortifications.

Race.—The origin of the Korean people is unknown. They are of the Mongol family; their language belongs to the so-called Turanian group, is polysyllabic, possesses an alphabet of 11 vowels and 14 consonants, and a script named *En-mun*. Literature of the higher class and official and upper class correspondence are exclusively in Chinese characters, but since 1895 official documents have contained an admixture of *En-mun*. The Koreans are distinct from both Chinese and Japanese in physiognomy, though dark straight hair, dark oblique eyes, and a tinge of bronze in the skin are always present. The cheek-bones are high; the nose inclined to flatness; the mouth thin-lipped and refined among patricians, and wide and full-lipped among plebeians; the ears are small, and the brow fairly well developed. The expression indicates quick intelligence rather than force and mental calibre. The male height averages 5 ft. 4½ in. The hands and feet are small and well-formed. The physique is good, and porters carry on journeys from 100 to 200 lb. Men marry at from 18 to 20 years, girls at 16, and have large families, in which a strumous taint is nearly universal. Women are secluded and occupy a very inferior position. The Koreans are rigid monogamists, but concubinage has a recognized status.

Government.—Up to July 1894 the system of administration was modelled on that of China, except that government was in the hands of a hereditary aristocracy, privileged and corrupt. The king was absolute, and law consisted practically of royal edicts, published in the *Gazette*. During the war between Japan and China, Japan, then in the ascendant, devised special machinery for the reform of Korean abuses, and during the following months the administration was reorganized and greatly assimilated to that of Japan. Between the close of 1895 and 1900 there were ceaseless administrative fluctuations; valuable reforms quietly lapsed; the general movement was retrograde, and the old order now exists in the spirit if not in the letter. The emperor is an independent and practically an absolute sovereign, the modifying influence of the cabinet having become insignificant. The central Government consists of a Council of State formed of a president premier, and the heads of nine departments—Home Office, Foreign Office, Treasury, War Office, Education, Justice, and the Ministry of Agriculture, Trade, and Industry, with their subordinate bureaux. This body frames laws and passes resolutions which require the

imperial seal for their validity. There is a Privy Council (consisting of a president, vice-president, not more than 50 councillors appointed by the throne, and two secretaries), which is empowered, when consulted by the cabinet, to inquire into questions referred to it. On paper the new constitution, which was very elaborate, modified the royal absolutism considerably; but a decree passed towards the end of 1896, after the king's escape from Japanese control, marked a distinct reversion to the absolutism renounced by his oath in January 1895. One by one the checks devised by the Japanese "advisers" became inoperative, and by 1898 the imperial will, working under partially new conditions, produced a continual chaos, and by 1900 succeeded practically in overriding all constitutional restraints.

Local Administration.—Korea for administrative purposes is divided into 13 provinces and 339 prefectures or magistracies, while the capital has a separate government, and each of the eight treaty ports and the Russo-Korean trading mart, Kyen-heung, is under a superintendent, ranking with a consul. The village is the administrative unit, and under the new system its headman and officials are annually elected. The headman and a man from each family form a village council, which deals by resolution with educational matters, registration of houses and lands, sanitation, roads and bridges, agricultural improvements, common dykes, payment of taxes, relief in famine, adjustment of the *corvée*, and bye-laws. All resolutions must be sent up to the Home Office through the prefect and the provincial governor twice a year. Above the village and below the prefecture are cantons and districts, but it is on the efficient working of the village system that much of Korean well-being depends.

Education.—The "Royal Examinations" in Chinese literature held in Seoul up to 1894, which were the entrance to official position, being abolished, the desire for a purely Chinese education has diminished. In Seoul there are now an imperial English school with two foreign teachers, a reorganized Confucian college, a normal college under a very efficient foreign principal, Japanese, Chinese, Russian, and French schools, chiefly linguistic, several Korean primary schools, mission boarding-schools, and the *Pai Chai* College, connected with the American Methodist Episcopal Church, under imperial patronage, and subsidized by Government, in which a liberal education of a high class is given and *En-mun* receives much attention. The Koreans are expert linguists, and the Government wisely makes liberal grants to the linguistic schools. About 1100 young men are receiving a liberal education under foreign teachers; and in the primary schools about 1200 boys are learning arithmetic, geography, and Korean history, with the outlines of the governmental systems of other civilized countries. The Education Department is tolerably efficient, and aims at the general extension of primary and intermediate schools, and a uniform series of text-books in the vernacular.

Law.—A criminal code, scarcely equalled for barbarity, though twice mitigated by royal edict since 1785, remained in force in its main provisions till 1895. Since then a mixed commission of revision has done some good work, but a body of law and the judges to administer it righteously have still to be created. The Ministry of Justice has charge of all judicial matters, and as a high court of justice hears appeals from certain district courts. Five classes of law courts have been established, and provision has been made for appeals in both civil and criminal cases. Elaborate legal machinery was devised, but it exists chiefly on paper, and its provisions are daily violated by the imperial will and the gross corruption of officials.

Kyei.—Abuses in legal administration and in tax-collecting are the chief grievances which lead to local insurrections. Oppression by the throne and the official and noble classes prevails extensively; but the weak protect themselves by the use of the *Kyei*, or principle of association, which develops among Koreans into powerful trading guilds, trades-unions, mutual benefit associations, money-lending guilds, &c. Nearly all traders, porters, and artisans are members of guilds, powerfully bound together and strong by combined action and mutual helpfulness in time of need.

Revenue and Finance.—The chief sources of revenue are the land tax, paid since 1896 in money; the customs duties; the house tax, from which Seoul is exempt; the *ginseng* duty, and the tax on gold dust. These yield roughly as follows:—Land tax, £277,364; house tax, £46,564; *ginseng* duty, £15,000; duty on gold dust, £4000; customs duties, £100,000; miscellaneous taxes, £30,000. The budget for 1899 showed an estimated expenditure of £647,113, with a small surplus; but the revenue for 1900 was only estimated at £520,000, with an expenditure of £690,000, in consequence of which deficit all new works were dropped and relief from financial straits was rendered necessary by a foreign loan. In 18 months

of 1896-97, with an Englishman in control of the Treasury, two-thirds of the Japanese loan of 3,000,000 *yen* of 1895 was paid off. The emperor's privy purse stands at £50,000.

Religion.—Buddhism, which swayed Korea from the 10th to the 14th century, has been discredited for three centuries, and its priests are ignorant, immoral, and despised. Confucianism is the official cult, and all officials offer sacrifices and homage at stated seasons in the Confucian temples. Confucian ethics are the basis of morality and social order. Ancestor-worship is universal. The popular cult is, however, the propitiation of demons, a modification of the Shamanism of Northern Asia. The belief in demons, mostly malignant, keeps the Koreans in constant terror, and much of their substance is spent on propitiations. Sorceresses and blind sorcerers are the intermediaries. The fees annually paid to these persons are estimated at 3,000,000 dollars. In January 1897 there were in Seoul 1000 sorceresses, earning on an average 15 dollars per month each, an annual expenditure on dealings with spirits by the most enlightened city in Korea of 180,000 dollars, exclusive of very large sums paid to the male sorcerers and geomancers.

Christianity.—Putting aside the temporary Christian work of a Jesuit chaplain to the Japanese Christian General Konishe, in 1594 during the Japanese invasion, as well as that on a larger scale by students who received the evangel in the Roman form from Peking in 1792, and had made 4000 converts by the end of 1793, the first serious attempt at the conversion of Korea was made by the French *Société des Missions Étrangères* in 1835. In spite of frequent persecutions, there were 16,500 converts in 1857 and 20,000 in 1866, in which year the French bishops and priests were martyred by order of the emperor's father, and several thousand native Christians were beheaded, banished, or imprisoned. This mission in 1900 had about 30 missionaries and 40,000 converts. In 1884 and 1885, toleration being established, Protestant missionaries of the American Presbyterian and Methodist Episcopal churches entered Korea, and have been followed by a large number of agents of other denominations. An English bishop, clergy, doctors, and nursing sisters arrived in 1890. Hospitals, orphanages, schools, and an admirable college in Seoul have been founded, along with tri-lingual (Chinese, Korean, and English) printing-presses; religious, historical, and scientific works and much of the Bible have been translated into *En-mun*, and periodicals of an enlightened nature in the Korean script are also circulated. The progress of Protestant missions was very slow for some years, but since 1895 converts have multiplied. In 1900 these missions had about 13,000 members and adherents, and 110 missionaries.

Defence.—The standing army, which (on paper) consists of cavalry, artillery, infantry, and engineers, numbers 4000 men in Seoul, 800 of whom constitute the imperial body-guard, 1200 in the provinces, and a cadet corps. Its uniform and equipments are European and modern; Berdon rifles chiefly and Gatling guns. Between 1893 and 1898 its drill instructors were successively American, Japanese, and Russian. Korea has no fortified places, the ancient "Five Fortresses" for the defence of Seoul being practically unarmed and in the hands of the priests. There is a naval school at Kong-wha, but no navy. Seoul has 1200 highly-paid military police.

Production and Industries.—(i.) *Minerals.*—Extensive coalfields, producing coal of fair quality, as yet undeveloped, occur in Hwang-hai Do and elsewhere. Iron is abundant, especially in Phÿng-an Do, and rich copper ore, silver, and galena are found. Experts believe that reefs of rich auriferous quartz exist. In 1885 the rudest process of "placer" washing produced an export of gold dust amounting to £120,000, and in 1897 to £205,529. These are the amounts declared as passing through the customs, but it is estimated that more than double these values leaves Korea clandestinely. The reefs were left untouched till 1897, when an American company, which had obtained a concession in Phÿng-an Do in 1895, introduced the latest mining appliances, and raised the declared export of 1898 to £240,047, believed to represent a yield for that year of £600,000. Russian, German, and English applicants have since obtained concessions. The *concessionnaires* regard Korean labour as docile and intelligent.

(ii.) *Agriculture.*—Korean soil consists largely of light sandy loam, disintegrated lava, and rich, stoneless alluvium, from 3 to 10 feet deep. The rainfall is abundant during the necessitous months of the year, facilities for the irrigation of the rice crop are ample, and drought and floods are seldom known. Land is held from the proprietors on the terms of receiving seed from them and

returning half the produce, the landlord paying the taxes. Any Korean can become a landowner by reclaiming and cultivating unoccupied crown land for three years free of taxation, after which he pays taxes annually. Good land produces two crops a year. The implements used are two makes of iron-shod wooden ploughs; a large shovel, worked by three or five men, one working the handle, the others jerking the blade by ropes attached to it; a short sharp-pointed hoe, a bamboo rake, and a wooden barrow, all of rude construction. Rice is threshed by beating the ears on a log; other grains, with flails on mud threshing-floors. Winnowing is performed by throwing up the grain on windy days. Rice is hulled and grain coarsely ground in stone querns or by water pestles. There are provincial horse-breeding stations, where pony stallions, from 10 to 12 hands high, are bred for carrying burdens. Magnificent red bulls are bred by the farmers for ploughing and other farming operations, and for the transport of goods. Sheep and goats are bred on the imperial farms, but only for sacrifice. Small, hairy, black pigs and fowls are universal. The cultivation does not compare in neatness and thoroughness with that of China and Japan. There are no trustworthy estimates of the yield of any given measurement of land. The farmers put the average yield of rice at thirtyfold, and of other grain at twentyfold. Korea produces all cereals and root crops except the tropical, along with cotton, tobacco, a species of the Rhea plant used for making grass-cloth, and the *Brousonettia papyrifera*. The articles chiefly cultivated are rice, millet, beans, *ginseng* (at Songdo), cotton, hemp, oil-seeds, bearded wheat, oats, barley, sorghum, and sweet and Irish potatoes. Korean agriculture suffers from infamous roads, the want of the exchange of seed, and the insecurity of the gains of labour. It occupies about three-fourths of the population.

(iii.) *Other Industries.*—The industries of Korea, apart from supplying the actual necessities of a poor population, are few and rarely collective. They consist chiefly in the manufacture of sea-salt, of varied and admirable paper, thin and poor silk, horse-hair crinoline for hats, fine split bamboo blinds, hats, and mats, coarse pottery, hemp cloth for mourners, brass bowls, and grass-cloth. Won-san and Fusan are large fishing centres, and salt fish and fish manure are important exports; but the prolific fishing grounds are worked chiefly by Japanese labour and capital, 6836 Japanese licensed boats having worked from Fusan in 1898. Paper and *ginseng* are the only manufactured articles on the list of Korean exports. The arts are *nil*.

Commerce.—Since certain Korean ports were opened by treaty to foreign trade the customs have been under the management of European commissioners nominated by Sir Robert Hart of Peking. The dues collected in 1885 were about £25,000, and in 1898 over £100,000. The following returns from 1884 to 1898 apply solely to the direct foreign trade of the open ports:—

(i.) *Foreign Trade*—

	Imports.	Exports.
1884	£170,113	£95,377
1885	290,727	91,759
1886	466,250	104,753
1887	541,761	187,164
1888	597,005	137,283
1889	603,729	185,076
1890	790,261	591,746
1891	876,078	561,057
1892	689,772	366,560
1893	487,598	316,072
1894	584,318	345,614
1895	875,820	396,715
1896	708,461	512,275
1897	1,017,238	906,737
1898	1,194,843	576,896

Gold dust is not included in the foregoing figures for exports. In order of value in 1898 the chief exports (including gold) stood thus: Rice, £278,272; gold, £240,047; beans, £112,469; *ginseng*, £95,446; hides, £23,874. Of the total import trade of 1898 cotton goods represented one-half, the British share averaging about £300,000. The other chief imports were silk piece-goods, £77,676; grass-cloth, £49,417; kerosene oil, £41,309; railway plant and machinery, £32,750; Japanese matches, £14,204. The imports of Japanese cotton yarn, which is woven into a strong cloth on Korean handlooms during the winter, rose from £33,467 in 1895 to £99,749 in 1898.

(ii.) *Shipping*.—In 1885 the shipping entered at three open ports was 321 sailing vessels and 138 steamers. In 1898 the shipping entered inwards and outwards at five open ports was as follows:—

Flag.	Total for Korea.			
	Sailing.		Steam.	
	Number of Vessels.	Tons.	Number of Vessels.	Tons.
British	1	1,908
Chinese . . .	463	9,257
Korean . . .	377	9,034	344	81,059
German	27	23,526
Japanese . . .	1359	53,669	758	448,476
Russian . . .	2	160	32	29,613
Norwegian	2	2,310
Hawaiian . . .	1	958
Total . . .	2202	73,078	1164	586,892

There is a noteworthy increase of vessels under the Korean flag. Korea has regular steam communication with ports in Japan, the Gulf of Pe-chi-li, Shanghai, and Vladivostok by Japanese and Russian steamers, and her own steamers call at most of her own ports.

Roads, Posts, Telegraphs.—The main roads centring in Seoul are seldom fit even for the passage of ox-carts, and the secondary roads are bad bridle-tracks, frequently degenerating into "rock ladders." The inland transit of goods is almost entirely on the backs of bulls carrying from 450 to 600 lb, on ponies carrying 200 lb, and on men carrying from 100 to 150 lb, bringing the average cost up to a fraction over 8d. per mile per ton. The *corvée* exists, with its usual hardships. Bridges are made of posts, carrying a framework either covered with timber or with pine branches and earth. They are removed at the beginning of the rainy season, and are not replaced for three months. The larger rivers are unbridged, but there are numerous Government ferries. The infamous roads and the risks during the bridgeless season greatly hamper trade. Under Japanese auspices a railway from Chemulpo was completed to the capital in 1900. The Japanese have secured a concession for a line from Seoul to Fusan, and the French one for a Seoul-Wiju railway, which, however, lapsed in 1899. Japanese steamers ply on the Han between Chemulpo and Seoul. A postal system, established in 1894–1895, has been gradually extended. There is a central office in Seoul, with about thirty provincial branches. There are postage stamps of four values. The Japanese have efficient post offices in Seoul and the treaty ports. Korea is connected with the Chinese and Japanese telegraph systems by a Japanese line from Chemulpo *via* Seoul to Fusan, and by a line lately acquired by the empire between Seoul and Wiju. The state has also lines from Seoul to Chemulpo, Fusan, and Won-san.

Banks and Money.—Banking facilities consist of the Russo-Korean Bank in Seoul, a branch of the Hong-Kong and Shanghai Bank at Chemulpo, and branches of two Japanese banks of high repute in Seoul and several of the open ports.

Currency.—Though Korea since the treaties has been constantly engaged in constructing mints, she can hardly be said to possess a currency. In 1894, on a silver basis, she issued a coinage of brass *cash*, 500 to the dollar, 1-cent copper pieces, 5-cent nickel pieces, and 20- and 100-cent silver. It was soon found that the larger silver coins were minted at a loss, and but few were issued. Korea practically depends on Japan for her currency, but Japanese silver and notes scarcely pass in the interior, and the medium of exchange remains the old and still legal debased copper *cash*, strung in strings of 100 on twisted straw, about 9 lb weight being the equivalent of a shilling. The adoption of a gold standard by Japan has caused much confusion. In 1898 the available coinage in Korea diminished by 2,000,000 *yen*, leaving only about 1,600,000 in silver and paper, a scarcity which affected trade injuriously.

History.—By both Korean and Chinese tradition Ki-tze—a councillor of the last sovereign of the 3rd Chinese dynasty, a sage, and the reputed author of parts of the famous Chinese classic, the *Shu-King*—is represented as entering Korea in 1122 B.C. with several thousand Chinese emigrants, who made him their king. The peninsula was then peopled by savages living in caves and subterranean holes. By both learned and popular belief in Korea Ki-tze is recognized as the founder of Korean social order, and is greatly revered. He called the new kingdom *Ch'ao-Hsien*, pacified and policed its borders, and introduced laws and Chinese etiquette and polity. Korean ancient history is far from satisfying the rigid demands of modern criticism, but it appears that Ki-tze's dynasty ruled the peninsula until the 4th century B.C., from which period until the 10th century A.D. civil wars and foreign aggressions are prominent. Nevertheless, Hiaksai, which with Korai and Shinra then constituted Korea, was a centre of literary culture in the 4th century, through which the Chinese classics and the art of writing reached the other two kingdoms. Buddhism, a forceful civilizing element, reached Hiaksai in A.D. 384, and from it the sutras and images of northern Buddhism were carried to Japan, as well as Chinese letters and ethics. Internecine wars were terminated about 913 by Wang the Founder, who unified the peninsula under the name Korai, made Song-do its capital, and endowed Buddhism as the state religion. In the 11th century Korea was stripped of her territory west of the Yalu by a warlike horde of Tungus stock, since which time her frontiers have been stationary. The Wang dynasty perished in 1392, an important epoch in the peninsula, when Ni Taijo, or Litan, the founder of the present dynasty, ascended the throne, after his country had suffered severely from Genghis and Khublai Khan. He tendered his homage to the first Ming emperor of China, received from him his investiture as sovereign, and accepted from him the Chinese calendar and chronology, in itself a declaration of fealty. He revived the name *Ch'ao-Hsien*, changed the capital from Song-do to Seoul, organized an administrative system, which with some modifications continued till 1895, and exists partially still, carried out vigorous reforms, disestablished Buddhism, made merit in Chinese literary examinations the basis of appointment to office, made Confucianism the state religion, abolished human sacrifices and the burying of old men alive, and introduced that Confucian system of education, polity, and social order which has dominated Korea for five centuries. Either this king or an immediate successor introduced the present national costume, the dress worn by the Chinese before the Manchu conquest. The early heirs of this vigorous and capable monarch used their power, like him, for the good of the people; but later decay set in, and Japanese buccaneers ravaged the coasts, though for two centuries under Chinese protection Korea was free from actual foreign invasion. In 1592 occurred the epoch-making invasion of Korea by a Japanese army of 150,000 men, by order of the great regent Hideyoshi. China came to the rescue with 60,000 men, and six years of a gigantic and bloody war followed, in which Japan used firearms for the first time against a foreign foe. Seoul and several of the oldest cities were captured, and in some instances destroyed, the country was desolated, and the art treasures and the artists were carried to Japan. The Japanese troops were recalled in 1598 at Hideyoshi's death. The port and fishing privileges of Fusan remained in Japanese possession, a heavy tribute was exacted, and until 1790 the Korean king stood in humiliating relations towards Japan. Korea never recovered from the effects of this invasion, which bequeathed to all Koreans an intense hatred of the Japanese, which has not been greatly modified in the three following centuries. In 1866, 1867, and 1870 French and American punitive expeditions attacked parts of Korea in which French missionaries and American adventurers had been put to death, and inflicted much loss of life, but retired without securing any diplomatic successes, and Korea continued to preserve her complete isolation. The first indirect step towards breaking it down had been taken in 1860, when Russia obtained from China the cession of the Usuri province, thus bringing a European power down to the Tumen. A large emigration of famine-stricken Koreans and persecuted Christians into Russian territory followed. The emigrants were very kindly received, and many of them became thrifty and prosperous farmers. In 1876 Japan, with the consent of China, wrung a treaty from Korea by which Fusan was fully opened to Japanese settlement and trade, and Won-san (Gensan) and Inchiun (Chemulpo) were opened to her in 1880. In 1882 China promulgated her "Trade and Frontier Regulations," and America negotiated a commercial treaty, followed by Germany and Great Britain in 1883, Italy and Russia in 1884, France in 1886, and Austria in 1892. A "Trade Convention" was also concluded with Russia. Seoul was opened in 1884 to foreign residence, and the provinces to foreign travel, and the diplomatic agents of the contracting Powers obtained a recognized status at the capital. These treaties terminated the absolute isolation which Korea had effectually preserved. During the negotiations, although under Chinese suzerainty, she was treated with as an independent state. Between 1897 and 1899, under diplomatic pressure, Song-chin, on

the north-east coast; Ma-san-po, near the mouth of the Nak-tong, 40 miles west of Fusan on the south coast; and Kun-san, Mok-po, and Chin-nam-po, on the west coast, were opened to foreign trade and residence. From 1882 to 1894 the chief event in the newly-opened kingdom was a plot by the Tai-won-Kun, the present emperor's father, to seize on power, which led to an attack on the Japanese Legation, the members of which were compelled to fight their way, and that not bloodlessly, to the sea. Japan secured ample compensation; and the Chinese Resident, aided by Chinese troops, deported the Tai-won-Kun to Tientsin. In 1884 at an official banquet the leaders of the progressive party assassinated six leading Korean statesmen, and the intrigues in Korea of the banished or escaped conspirators have created difficulties which have not yet subsided. In spite of a constant struggle for ascendancy between the queen and the returned Tai-won-Kun, the next decade was one of quiet. China, always esteemed in Korea, consolidated her influence under the new conditions through a powerful Resident; prosperity advanced, and certain reforms were projected by foreign "advisers." In May 1894 a more important insurrection rising than usual led the king to ask armed aid from China. She landed 2000 troops on 10th June, having previously, in accordance with treaty provisions, notified Japan of her intention. Soon after this Japan had 12,000 troops in Korea, and occupied the capital and the treaty ports. Then Japan made three sensible proposals for Korean reform, to be undertaken jointly by herself and China. China replied that Korea must be left to reform herself, and that the withdrawal of the Japanese troops must precede negotiations. Japan rejected this suggestion, and on 23rd July attacked and occupied the royal palace. After some further negotiations and fights by land and sea between Japan and China war was declared formally by Japan, and Korea was for some time the battle-ground of the belligerents. The Japanese victories resulted for Korea in the solemn renunciation of Chinese suzerainty by the Korean king, the substitution of Japanese for Chinese influence, the introduction of many important reforms under Japanese advisers, and of checks on the absolutism of the throne. Everything promised well. The finances flourished under the capable control of Mr M'Leavy Brown, C.M.G. Large and judicious retrenchments were carried out in most of the Government departments. A measure of judicial and prison reform was granted. Taxation was placed on an equitable basis. The pressure of the trade guilds was relaxed. Postal and educational systems were introduced. An approach to a constitution was made. The distinction between patrician and plebeian, domestic slavery, and beating and slicing to death were abolished. The age for marriage of both sexes was raised. Chinese literary examinations ceased to be a passport to office. Classes previously degraded were enfranchised, and the alliance between two essentially corrupt systems of government was severed. For about eighteen months all the departments were practically under Japanese control. On 8th October 1895 the Tai-won-Kun, with Korean troops, aided by Japanese troops under the orders of Viscount Miura, the Japanese minister, captured the palace, assassinated the queen, and made a prisoner of the king, who, however, four months later, escaped to the Russian Legation, where he remained till the spring of 1897. Japanese influence waned. The engagements of the advisers were not renewed. A strong retrograde movement set in. Reforms were dropped. The king, with the checks upon his absolutism removed, reverted to the worst traditions of his dynasty, and the control and arrangements of finance were upset by Russia. Korea, incapable of standing alone, now leans upon Russia or Japan, according to the pressure applied at the time. At the close of 1897 the king assumed the title of emperor, and changed the official designation of the empire to *Dai Han*—Great Han. Early in 1902 the independence of Korea was guaranteed by a clause in the treaty of alliance signed in that year between Great Britain and Japan. (See also CHINA, JAPAN.)

AUTHORITIES.—The first Asiatic notice of Korea is by Khoradbeh, an Arab geographer of the 9th century A.D., in his *Book of Roads and Provinces*, quoted by Baron Richthofen in his great work on *China*, p. 575. The earliest European source of information is a narrative by H. Hamel, a Dutchman, who was shipwrecked on the coast of Quelpart and held in captivity in Korea for thirteen years. The amount of papers on Korea scattered through English, German, French, and Russian magazines, and the proceedings of geographical societies, is very great, and for the last three centuries Japanese writers have contributed largely to the sum of general knowledge of the peninsula. The list which follows includes some of the more recent works which illustrate the history, manners and customs, and awakening of Korea:—*British Foreign Office Reports on Korean Trade, Annual Series*. London.—*Bibliographie Koréenne*, 3 vols. Paris, 1897.—BISHOP, Mrs I. L. *Korea and Her Neighbours*, 2 vols. London, 1897.—BRANDT, M. VON. *Ostasiatische Fragen*. Leipzig, 1897.—CAVENDISH, A. E. J., and GOULD ADAMS, H. E. *Korea, and the Sacred White Mountain*. London, 1894.—CULIN, STEWART. *Korean Games*. Philadelphia,

1895.—CURZON. *Problems of the Far East*. London, 1896.—DALLEY. *Histoire de l'église de Corée*, 2 vols. Paris, 1874.—GALE, J. S. *Korean Sketches*. Edinburgh, 1898.—GRIFFIS, W. E. *The Hermit Nation*, 3rd and revised edition. New York, 1889.—HAMEL, H. *Relation du Naufrage d'un Vaisseau Habindois, &c., traduite du Flamand par M. Minutoli*. Paris, 1670.—HIDEMOTO, OKOJI. *Der Feldzug der Japaner gegen Korea im Jahre 1597: translated from Japanese by Professor von Pfizmaier*, 2 vols. Vienna, 1875.—JAMETEL, M. "La Corée: Ses ressources, son avenir commercial." *L'Économiste Française*. Paris, July 1881.—LOWELL, PERCIVAL. *Chosön: The Land of the Morning Calm*. London, Boston, 1886.—MILN, L. J. *Quaint Korea*. Harper, New York, 1895.—LAGUERIE, V. DE. *La Corée Indépendante, Russe ou Japonaise?* Paris, 1898.—ROSS, J. *Korea: Its History, Manners, and Customs*. Paisley, 1880.—WILKINSON, W. H. *The Korean Government: Constitutional Changes in Korea during the period 23rd July 1894–30th June 1896*. Shanghai, 1896. Dictionaries and vocabularies by Mr Meyers, the French missionaries, and others, were superseded in 1898 by a large and learned volume by the Rev. J. S. Gale, a Presbyterian missionary, who devoted some years to the work. (I. L. B.)

Korets, a town of south-west Russia, government of Volhynia, 73 miles north-west of Zhitomir. It is one of the oldest Russian towns, being mentioned first in the annals in 1150. It was often plundered by the Lithuanians, the Poles, and the Cossacks in the 15th, 16th, and 17th centuries. It has now woollen-cloth mills, distilleries, and tanneries. Population (1897), 9600.

Korneuburg, the chief town of a government district in Lower Austria, on the left bank of the Danube, opposite Klosterneuburg, 8 miles north by west of Vienna. It is a steamship station and an important emporium of the salt and corn trade. The industry comprises the manufacture of coarse textiles, pasteboard, &c. Its charter as a town dates from 1298, and it was a much-frequented market in the preceding century. At the beginning of the 15th century it was surrounded by walls, and in 1450 a fortress was erected. It was frequently involved in the conflict between the Hungarian king Matthias Corvinus and the Emperor Frederick III., and also during the Thirty Years' War. Population (1890), 7271; (1900), 8298, German.

Korostyshev, a town of south-west Russia, government of Kieff. It lies 13 miles east of Zhitomir, of which it has become a summer resort, on account of its picturesque situation on the Teterev and easy access. It has iron mineral springs, a seminary for teachers, several woollen-cloth mills, two paper mills, saw-mills, tanneries, distilleries, and granite quarries. Population (1897), 13,000.

Korsör, a seaport town of Denmark, county Sorö, on the island of Zealand, 71 miles by rail west-south-west of Copenhagen, on the east shore of the Great Belt. The harbour, which is formed by a bay of the Baltic, has a depth throughout of 20 feet. It is the point of departure and arrival of the steam ferry to Nyborg on Fünen. The port was entered by 1689 vessels of 295,213 tons, and cleared by 1683 of 297,199 tons in 1899. The chief exports were fish, cereals, bacon; the chief imports, petroleum and coal. A market town since the 14th century, Korsör has ruins of an old fortified castle, on the south side of the channel, dating from the 14th and 17th centuries. Population (1880), 3954; (1890), 4685; (1900), 6054.

Kosel, a town of Prussia, province of Silesia, on the Oder, 29 miles south-east of Oppeln by rail. It was a fortified town from the 13th century until 1874, when the fortifications were razed and their site laid out as promenades. There is a lively river trade and manufacture of sugar, cheese, and leather; the royal stud farm for the province is situated here. Population (1885), 5461; (1900), 7085.

Kösen, a village and summer resort of Prussia, province of Saxony, 33 miles by rail south by west of Halle, on the Saale. On the adjacent Rudelsburg the German students have erected monuments to their comrades who fell in the Franco-German war of 1870-71, to Bismarck (1896), and to the Emperor William I. Here is also a saline mineral spring used for bathing. Kösen is famous as the central meeting-place of the German students' corps, which holds an annual congress every Whitsuntide. Population (1900), 2901.

Köslin, a town of Prussia, province of Pomerania, 105 miles by rail north-east of Stettin. There are a cadet academy and a deaf and dumb asylum. Population (1885), 17,277; (1895), 18,935; (1900), 20,418.

Kossuth, Lajos [LOUIS] (1802-1894), Hungarian patriot, was born at Monok, a small town in the county of Zemplin. His father, who was descended from an old untitled noble family and possessed a small estate, was by profession an advocate. Louis, who was the eldest of four children, received from his mother a strict religious training. His education was completed at the Calvinist college of Scharashottak and at the University of Budapest. At the age of nineteen he returned home and began practice with his father. His talents and amiability soon won him great popularity, especially among the peasants. He was also appointed steward to the Countess Szapary, a widow with large estates, and, as her representative, had a seat in the County Assembly. This position he lost owing to a quarrel with his patroness, and he was accused of appropriating money to pay a gambling debt. His fault cannot have been very serious, for he was shortly afterwards (he had in the meantime settled in Pesth) appointed by Count Hunyady to be his deputy at the National Diet in Pressburg. At the age of twenty he therefore was introduced to political life. It was a time when, under able leaders, a great national party was beginning the struggle for reform against the stagnant Austrian Government. As deputy he had no vote, and he naturally took little share in the debates, but it was part of his duty to send written reports of the proceedings to his patron, since the Government, with a well-grounded fear of all that might stir popular feeling, refused to allow any published reports. Kossuth's letters were so excellent that they were circulated in MS. among the Liberal magnates, and soon developed into an organized parliamentary Gazette (*Orszaggyulesi tudositások*), of which he was editor. At once his name and influence spread. In order to increase the circulation, he ventured on lithographing the letters. This brought them under the official censure, and was forbidden. He continued the paper in MS., and when the Government refused to allow it to be circulated through the post, sent it out by hand. In 1836 the Diet was dissolved. Kossuth continued the agitation by reporting in letter form the debates of the county assemblies, to which he thereby gave a political importance which they had not had when each was ignorant of the proceedings of the others. The fact that he embellished with his own great literary ability the speeches of the Liberals and Reformers only added to the influence of his news-letters. The Government in vain attempted to suppress the letters, and, other means having failed, he was in 1837, with Weszelenyi and several others, arrested on a charge of high treason. After spending a year in prison at Ofen, he was tried and condemned to four more years' imprisonment. His confinement was strict and injured his health, but he was allowed the use of books. He greatly increased his political information, and also acquired, from the study of the Bible and Shakespeare, a wonderful knowledge of English. His arrest

had caused great indignation. The Diet which met in 1839 supported the agitation, for the release of the prisoners, and refused to pass any Government measures. Metternich long remained obdurate, but the danger of war in 1840 obliged him to give way. Immediately after his release Kossuth married a lady who during his prison days had shown great interest in him. Henceforward she strongly urged him on in his political career. He had now become a popular leader. As soon as his health was restored he was appointed editor of the *Pesti Hirlap*, the newly-founded organ of the party. Strangely enough, the Government did not refuse its consent. The success of the paper was unprecedented. The circulation soon reached what was then the immense figure of 7000. The attempts of the Government to counteract his influence by founding a rival paper, the *Vilag*, only increased his importance and added to the political excitement. The warning of the great reformer Szecsenyi that by his appeal to the passions of the people he was leading the nation to revolution was neglected. Kossuth, indeed, was not content with advocating those reforms—the abolition of entail, the abolition of feudal burdens, taxation of the nobles—which were demanded by all the Liberals. By insisting on the superiority of the Magyars to the Slavonic inhabitants of Hungary, by his violent attacks on Austria (he already discussed the possibility of a breach with Austria), he raised the national pride to a dangerous pitch. At last, in 1844, the Government succeeded in breaking his connexion with the paper. The proprietor, in obedience to orders from Vienna (this seems the most probable account), took advantage of a dispute about salary to dismiss him. He then applied for permission to start a paper of his own. In a personal interview Metternich offered to take him into the Government service. The offer was refused, and for three years he was without a regular position. He continued the agitation with the object of attaining both the political and commercial independence of Hungary. He adopted the economic principles of List, and founded a society, the "Vedegylet," the members of which were to consume none but home produce. He advocated the creation of a Hungarian port at Fiume. With the autumn of 1847 the great opportunity of his life came. Supported by the influence of Louis Batthyany, after a keenly fought struggle he was elected member for Budapest in the new Diet. "Now that I am a deputy, I will cease to be an agitator," he said. He at once became chief leader of the Liberals. Deak was absent. Batthyany, Szecsenyi, Szemere, Eotvos, his rivals, saw how his intense personal ambition and egoism led him always to assume the chief place, and to use his parliamentary position to establish himself as leader of the nation, but before his eloquence and energy all apprehensions were useless. His eloquence was of that nature, in its impassioned appeals to the strongest emotions, that it required for its full effect the highest themes and the most dramatic situations. In a time of rest, though he could never have been obscure, he would never have attained the highest power. It was therefore a necessity of his nature, perhaps unconsciously, always to drive things to a crisis. The crisis came, and he used it to the full.

On 3rd March 1848, as soon as the news of the Revolution in Paris had arrived, in a speech of surpassing power he demanded parliamentary government for Hungary and constitutional government for the rest of Austria. He at once became the leader of the European revolution; his speech was read aloud in the streets of Vienna to the mob by which Metternich was overthrown, and when a deputation from the Diet visited Vienna to receive the assent of the Emperor to their petition, it was Kossuth who received the chief ovation. Batthyany, who formed

the first responsible ministry, could not refuse to admit Kossuth, but he gave him the ministry of finance, probably because that seemed to open to him fewest prospects of engrossing popularity. If that was the object, it was in vain. With wonderful energy he began developing the internal resources of the country: he established a separate Hungarian coinage—as always, using every means to increase the national self-consciousness; and it was characteristic that on the new Hungarian notes which he issued his own name was the most prominent inscription; hence the name of *Kossuth notes*, which was long celebrated. A new paper was started, to which was given the name of *Kossuth Hirlapia*, so that from the first it was Kossuth rather than the Palatine or the president of the ministry whose name was in the minds of the people associated with the new Government. Much more was this the case when, in the summer, the dangers from the Croats, Serbs, and the reaction at Vienna increased. In a great speech of 11th July he asked that the nation should arm in self-defence, and demanded 200,000 men; amid a scene of wild enthusiasm this was granted by acclamation. When Jellachich was marching on Pesth he went from town to town rousing the people to the defence of the country, and the popular force of the *Honvéd* was his creation. When Batthyany resigned he was appointed with Szemere to carry on the Government provisionally, and at the end of September he was made President of the Committee of National Defence. From this time he was in fact, if not in name, the dictator. With marvellous energy he kept in his own hands the direction of the whole Government. Not a soldier himself, he had to control and direct the movements of armies; can we be surprised if he failed, or if he was unable to keep control over the generals or to establish that military co-operation so essential to success? Especially it was Görgei (*q.v.*), whose great abilities he was the first to recognize, who refused obedience; the two men were in truth the very opposite to one another; the one all feeling, enthusiasm, sensibility; the other cold, stoical, reckless of life. Twice Kossuth deposed him from the command; twice he had to restore him. It would have been well if Kossuth had had something more of Görgei's calculated ruthlessness, for, as has been truly said, the revolutionary power he had seized could only be held by revolutionary means; but he was by nature soft-hearted and always merciful; though often audacious, he lacked decision in dealing with men. It has been said that he showed a want of personal courage: this is not improbable; the excess of feeling which made him so great an orator could hardly be combined with the coolness in danger required of a soldier; but no one was able, as he could, to infuse courage into others. During all the terrible winter which followed, his energy and spirit never failed him. It was he who overcame the reluctance of the army to march to the relief of Vienna; after the defeat of Schwechat, at which he was present, he sent Bem to carry on the war in Transylvania. At the end of the year, when the Austrians were approaching Pesth, he asked for the mediation of Mr Stiles, the American envoy. Windischgratz, however, refused all terms, and the Diet and Government fled to Debreczin, Kossuth taking with him the regalia of St Stephen, the sacred Palladium of the Hungarian nation. Immediately after the accession of the Emperor Francis Joseph all the concessions of March had been revoked and Kossuth with his colleagues outlawed. In April, when the Hungarians had won many successes, after sounding the army, he issued the celebrated declaration of Hungarian independence, in which he declared that "the house of Hapsburg-Lorraine, perjured in the sight of God and

man, had forfeited the Hungarian throne." It was a step characteristic of his love for extreme and dramatic action, but it added to the dissensions between him and those who wished only for autonomy under the old dynasty, and his enemies did not scruple to accuse him of aiming at the crown himself. For the time the future form of government was left undecided, but Kossuth was appointed responsible Governor. The hopes of ultimate success were frustrated by the intervention of Russia; all appeals to the Western Powers were vain, and on 11th August Kossuth abdicated in favour of Görgei, on the ground that in the last extremity the general alone could save the nation. How Görgei used his authority to surrender is well known; the capitulation was indeed inevitable, but a greater man than Kossuth would not have avoided the last duty of conducting the negotiations so as to get the best terms.

With the capitulation of Villagos Kossuth's career was at an end. A solitary fugitive, he crossed the Turkish frontier. He was hospitably received by the Turkish authorities, who, supported by Great Britain, refused, notwithstanding the threats of the allied emperors, to surrender him and the other fugitives to the merciless vengeance of the Austrians. In January 1849 he was removed from Widdin, where he had been kept in honourable confinement, to Shumla, and thence to Katakia in Asia Minor. Here he was joined by his children, who had been confined at Pressburg; his wife (a price had been set on her head) had joined him earlier, having escaped in disguise. In September 1851 he was liberated and embarked on an American man-of-war. He first landed at Marseilles, where he received an enthusiastic welcome from the people, but the prince-president refused to allow him to cross France. On 23rd October he landed at Southampton and spent three weeks in England, where he was the object of extraordinary enthusiasm, equalled only by that with which Garibaldi was received ten years later. Addresses were presented to him at Southampton, Birmingham, and other towns; he was officially entertained by the Lord Mayor of London; at each place he pleaded the cause of his unhappy country. Speaking in English, he displayed an eloquence and command of the language scarcely excelled by the greatest orators in their own tongue; and if we recollect that he had never before been outside the Austrian Empire, these speeches must be recognized as being among the most marvellous products of human genius. The agitation had no immediate effect, but the indignation which he aroused against Russian policy had much to do with the strong anti-Russian feeling which made the Crimean war possible.

From England he went to the United States of America: there his reception was equally enthusiastic, if less dignified; an element of charlatanism appeared in his words and acts which soon destroyed his real influence. Other Hungarian exiles protested against the claim he appeared to make that he was the one national hero of the Revolution. Count Casimir Batthyany attacked him in *The Times*, and Szemere, who had been prime minister under him, published a bitter criticism of his acts and character, accusing him of arrogance, cowardice, and duplicity. He soon returned to England, where he lived in close connexion with Mazzini, by whom, with some misgiving, he was persuaded to join the Revolutionary Committee. Quarrels of a kind only too common among exiles followed; the Hungarians were especially offended by his claim still to be called Governor. He watched with anxiety every opportunity of once more freeing his country from Austria. An attempt to organize a Hungarian legion during the Crimean war was stopped, but in 1859 he entered into negotiations with Napoleon, left England for Italy, and began the organization of a

Hungarian legion, which was to make a descent on the coast of Dalmatia. The Peace of Villafranca made this impossible. From that time he resided in Italy; he refused to follow the other Hungarian patriots, who, under the lead of Deak, accepted the compromise of 1866; for him there could be no reconciliation with the house of Hapsburg, nor would he accept less than full independence and a republic. He would not avail himself of the amnesty, and though elected to the Diet of 1867, never took his seat. He never lost the affections of his countrymen, but he refrained from an attempt to give practical effect to his opinions, nor did he allow his name to become a new cause of dissension. A law of 1879, which deprived of citizenship all Hungarians who had voluntarily been absent ten years, was a bitter blow to him.

He died in Turin on 23rd March 1894, at the age of ninety-two; his body was taken to Pesth, where he was buried amid the mourning of the whole nation.

There is no full biography of Kossuth, and many points in his career and character will probably always remain the subject of controversy. The fullest account of the Revolution is given in HELPERT, *Geschichte Oesterreichs*, Leipzig, 1869, &c., representing the Austrian view.

Kostroma, a government of middle Russia. Area, 32,702 square miles. Nearly three-quarters of the surface is covered with woods. Population (1897), 1,429,228, thoroughly Russian, with a small admixture of other aborigines. Agriculture remains relatively poor. Out of 20,001,000 acres, 7,861,500 acres belong to private owners, 6,379,500 to the peasant communities, 3,660,800 to the crown, and 1,243,000 to the imperial family. Only 2,300,000 acres are under grain crops, the average crop being about 3,300,000 quarters. Flax crops are on the increase, also hops. There were in 1897, 258,207 horses, 435,000 cattle, and 439,000 sheep. Domestic industries are widely spread. Factories are growing—chiefly cotton, flax, and linen mills, chemical works, tanneries, paper mills, &c.—and show an aggregate yearly return of about £3,000,000. There is only one school for 3296 inhabitants. It is divided into twelve districts, the chief towns of which are Kostroma (41,268), Bui (2626), Chukhloma (2200), Galich (6182), Kineshma (7564), Kologriv (2566), Makariev (6068), Nerekhta (3000), Soligalich (3420), Varnavin (1140), Vetluga (5200), and Yurievets (4778).

Kotah, a native state of India, in the Rajputana Agency, with an area of 3803 square miles. The population in 1881 was 417,275; in 1891, 526,267, showing an apparent increase of 26 per cent.; average density, 138 persons per square mile. In 1901, on an enlarged area of about 5700 square miles, the population was 544,349, showing an average density of only 96 persons per square mile. The gross revenue in 1896-97 was Rs.27,83,072; tribute, Rs.3,84,720; expenditure on public works, Rs.3,31,390; on army Rs.4,20,000; number of schools, 26, attended by 1490 pupils, of whom 85 were girls. In 1897 a considerable portion of the area added to Jhalawar in 1838 was restored to Kotah. The present Maharao, Umad Singh, was born in 1873, and succeeded in 1889. He was educated at the Mayo College, Ajmere. A continuation of the branch line of the Indian Midland railway from Goona to Bara passes through Kotah for 29 miles. It was opened in 1889 at a cost to the state of Rs.19,00,000. It was proposed to construct a light railway from Bara to Kotah town. The state suffered from drought in 1896-97,

and again more severely in 1899-1900. In 1896-97 the coinage at the mint was Rs.24,130, the rupee being of the same weight and fineness as the British rupee. The inscription on the reverse, in Persian characters, was "Her Majesty of England, the victorious monarch." The town of КОТАН is on the right bank of the Chambal. Population (1881), 40,270; (1891), 38,793; (1901), 33,679, showing a continuous decrease. A handsome new palace has been constructed, and a water-supply for the town and suburbs is under consideration by the municipal committee. The high school had 378 pupils in 1897-98, of whom 158 were learning English. The school for the sons of nobles had 56 pupils, in addition to 9 boys at the Mayo College educated at the expense of the state. There are also two girls' schools, for Hindu and Mahommedan girls. The Victoria Hospital is under a native Christian lady. The public library called the Crosthwaite Institute was founded in 1899.

Kotelna, a town of Russia, government of Kharkov, district Akhtyrka, on the frontier of Poltava. It has a variety of domestic trades, forges, and oil works. Population, 13,960.

Köthen, or CÖTHEN, a town of Germany, duchy of Anhalt, 22 miles by rail north of Halle. It has a technical institute, a school of gardening, and a school of forestry. A new town hall was finished in 1899. Among others, there is a monument to J. S. Bach, who was music director here from 1717 to 1723. Population (1885), 17,473; (1900), 22,092.

Kotka, a seaport of Russia, Finland, government of Viborg, 35 miles by rail from Kuivola junction of the Helsingfors railway, on an island of same name at the mouth of the Kymmene river. Timber is shipped down this river from all the lakes of the Pajane basin to the sawmills of Kotka, employing 1400 workers. Over 200,000 cubic metres of timber are exported. It is also the chief port for exports from and imports to East Finland. It is the military station of the Russian navy, and has three gymnasias and technical schools. Population (1897), 4801.

Kovalevsky, Sophie (1850-1891), Russian mathematician, daughter of General Corvin-Krukovsky, was born at Moscow, 15th January 1850. From her earliest childhood she showed a remarkable love of study and the keenest interest in mathematical forms, even before she had any conception of their meaning. As a young girl she was fired by the aspiration after intellectual liberty that animated so many young Russian women at that period, and drove them to study at foreign universities, since their own were closed to them. This led her, in 1868, to contract one of those conventional marriages in vogue at the time, with a young student, Waldemar Kovalevsky, and the two went together to Germany to continue their studies. She first went to Heidelberg, where she studied under Helmholtz, Kirchhoff, Königsberger, and du Bois-Reymond, and from 1871-74 read privately with Weierstrass at Berlin, as the public lectures were not then open to women. In 1874 the University of Göttingen granted her a degree *in absentia* excusing her from the oral examination on account of the remarkable excellence of the three dissertations sent in, one of which, on the theory of partial differential equations, is one of her most remarkable works. Another was an elucidation of Laplace's mathematical theory of the form of Saturn's rings. Soon after this she returned to Russia with her husband, who was appointed professor of palaeontology at Moscow, where he died in 1883. At this time Madame Kovalevsky was at Stockholm, where Mittag Leffler, also a pupil of Weierstrass, who had been recently appointed to

the chair of mathematics at the newly-founded university, had procured for her a post as lecturer. She discharged her duties so successfully that in 1884 she was appointed full professor. This post she held till her death on 10th February 1891. In 1888 she achieved the greatest of her successes, gaining the Prix Bordin offered by the Paris Academy. The problem set was "to perfect in one important point the theory of the movement of a solid body round an immovable point," and her solution added a result of the highest interest to those transmitted to us by Euler and Lagrange. So remarkable was this work that the value of the prize was doubled as a recognition of unusual merit. Unfortunately Madame Kovalevsky did not live to reap the full reward of her labours, for she died just as she had attained the height of her fame and had won recognition even in her own country by election to membership of the St Petersburg Academy of Science.

Kovel, a district town of Russia, government of Volhynia, 117 miles by rail south-east of Brest Litovsk, on the marshy banks of the Turiya. Population (1897), 17,300, more than one-third of whom are Jews.

Kovno, a Lithuanian government of north-west Russia. It touches the Baltic Sea by a narrow strip at Memel. Population (1857), 969,369; (1897), 1,549,444, of whom 788,102 are women, and 147,878 live in towns. Average births 54,000, deaths 36,000; average increase about 1 per cent. The ethnographical composition of the population was estimated by Rittich as: Zhmudes, 40 per cent., chiefly in the west; Lithuanians, 30 per cent., chiefly in the east; Jews, 18 per cent.; Germans, about 16,000; Russians only 5280, and Poles only 3130 families. These figures remain approximately correct, only Jews (313,417 in 1892) having grown to be more than 25 per cent. of the population. Agriculture is in a good condition, but the peasants' allotments are small, and a considerable number of the peasants are agricultural labourers. The average acreage under crops is 3,369,400 under various grains, and 202,500 under potatoes, so that in an average year the province has an available surplus of 2,200,000 quarters of grain and about 840,000 quarters of potatoes. Nearly 285,000 cwts. of flax are obtained every year. Dairying is in a good condition, and horse and cattle breeding are attracting attention. Fishing, too, is important, and the navigation on the rivers is brisk. A variety of small and domestic industries is carried on in the towns by the Jewish population (23,769 artisans in 1893), but only to a slight extent in the villages. As many as from 18,000 to 24,000 men are compelled every year to migrate in search of work. The yearly returns of the factories (1360) attain about £650,000 (distilleries, tobacco, steam flour-mills, hardware). Schools are insufficient (only 13,827 pupils in the elementary schools), but well organized. All village schools have small libraries and land (1 to 3 acres) for model school gardens. The chief towns of the seven districts into which the government is divided are Kovno, Novoalexandrovsk (6370), Povenyehz (13,044), Rossieny (7455), Shavl'i (15,914), Telshi (6215), and Vilkomir (13,509).

Kovno (Polish *Kowno*, Russian *Kovna*, Lithuanian *Kaune*), capital of the above government, at the confluence of the Niemen with the Viliya, 503 miles south-west of St Petersburg by rail, and 54 miles from Wierzbołowo (Prussian frontier). It is a first-class fortress. It is an important entrepôt for goods passing from and to Prussia, but the yearly returns of sea-borne goods brought by rail only attain 75,000 tons. Population (1863), 23,937; (1897), 73,543.

Kovroff, a district town of Russia, government and 40 miles by rail north-east of Vladimir, on the line to

Nijni-Novgorod. It has large railway carriage works, cotton mills (1700 workers), steam flour-mills, tallow houses, &c., and quarries of limestone. Population (1890), 6600; (1897), 14,570.

Kozlov, a district town of Russia, government and 45 miles west of Tambov, on the Lyesnoi Voronezh river, amidst a fertile agricultural region. It is a railway junction, and consequently its importance for the export of cattle (65,000 head), grain, meat, eggs (22,000,000), tallow, hides, &c., is steadily growing, as are also its factories, flour-mills, tallow-houses, distilleries, tanneries, glue-works, &c. Population (1897), 40,347.

Kragerö, a town of Norway, Bratsberg county, on the south coast, 67 miles north-east of Christiansand. The total trade is valued at about £127,000 a year. The chief exports are timber, ice, wood-pulp, and apatite and felspar. Coal is the principal import. The town possesses a mercantile fleet of some 46,000 tons burden. Population (1875), 4669; (1900), 5223.

Kraguyevatz, the principal town of central Serbia (so-called "Thoomadiya," the forest land), 59 miles south-south-east of Belgrade. It is situated on the small river Lepenitza, in a very fertile country. In the first years of Serbia's autonomy under Prince Milosh, it was the residence of the prince and the seat of government (1818-39). Even later, between 1868 and 1880, the National Assembly (*Nardona Skupstina*) usually met there. In 1857 the first cannon-foundry in Serbia was established there, and since that time it has developed into the principal arsenal and military store of the country. It is the seat of the district prefecture, of a tribunal, and of a large garrison. It boasts the finest college building and the finest cathedral (in Byzantine style) in Serbia. In 1885 it was connected by a branch line (Kraguyevatz-Lapovo) with the principal railway (Belgrade-Nish), and since then the prosperity of the town has steadily increased. Population, 14,160.

Krakatoa. See GEOLOGY (III.).

Kraszewski, Joseph Ignatius (1812-1887), Polish novelist and miscellaneous writer, was born at Warsaw, 27th July 1812, of an aristocratic family. He showed a precocious talent for authorship, beginning his literary career with a volume of sketches from society as early as 1829, and for more than half a century scarcely ever intermitting his literary production, except during a period of imprisonment upon a charge of complicity in the insurrection of 1831. He narrowly escaped being sent to Siberia, but, rescued by the intercession of powerful friends, he settled upon his landed property near Grodno, and devoted himself to literature with such industry that a mere selection from his fiction alone, published at Lemberg from 1871 to 1875, occupies 102 volumes. He was thus the most conspicuous literary figure of his day in Poland. His extreme fertility was suggestive of haste and carelessness, but he declared that the contrivance of his plot gave him three times as much trouble as the composition of his novel. Apart from his gifts as a story-teller, he did not possess extraordinary mental powers; the "profound thoughts" culled from his writings by his admiring biographer Bohdanowicz are for the most part mere truisms. His copious invention is nevertheless combined with real truth to nature, especially evinced in the beautiful little story of *Jermola the Potter* (1857), from which George Eliot appears to have derived the idea of *Silas Marner*, though she can only have known it at second hand. Compared with the exquisite art of *Silas Marner*, *Jermola* appears rude and unskilful, but it is not on

this account the less touching in its fidelity to the tenderest elements of human nature. Kraszewski's literary activity falls into two well-marked epochs, the earlier when, residing upon his estate, he produced romances like *Jermola*, *Ulana*, *Korddecki*, devoid of any special tendency, and that after 1863, when the suspicions of the Russian Government compelled him to settle in Dresden. To this period belong several political novels published under the name of *Boleslawita*, historical fictions such as *Countess Cosel*, and the "culture" romances *Morituri* and *Resurrection*, by which he is perhaps best known out of his own country. In 1884 he was accused of plotting against the German Government, and sentenced to seven years' imprisonment in a fortress, but was released in 1886, and withdrew to Geneva, where he died on 19th March 1887. His remains were brought to Poland and interred at Cracow. Kraszewski was also a poet and dramatist; his most celebrated poem is his epic "Anafielas" (1840-43). He was indefatigable as literary critic, editor, and translator, wrote several historical works, and was conspicuous as a restorer of the study of national archaeology in Poland. (R. G.)

Kremenets (Polish, *Kremeniec*), a district town of south-west Russia, government of Volhynia, 128 miles west of Zhitomir, and 25 miles east of Brody railway station, in Austrian Galicia. It is situated in a gorge of the Kremenets Hills, where an old Polish fortress, now in ruins, was erected. It has trade in tobacco and grain for export. Population (1897), 17,618.

Kremenskaya, a growing Cossack village of south-east Russia, province of Don Cossacks, 70 miles north-west of Tsaritzyn. Population (1892), 9900; (1895), 15,727.

Krementchug, a district town of south-west Russia, government and 75 miles by rail south-west of Poltava, on the left bank of the Dnieper. It is an important entrepôt for commerce, chiefly in grain and timber, and is also a considerable river port and a growing industrial centre (steam flour-mills, steam saw-mills, forges, tobacco factories, &c.). Population (1887), 31,000; (1897), with Kryukov suburb, on the opposite side of the Dnieper, 58,648.

Krems, or KREMS AN DER DONAU, chief town of a district in Lower Austria, at the confluence of the Krems with the Danube. The manufactures comprise steel goods, mustard and vinegar, and a special kind of white lead (*Kremser Weiss*) is prepared from deposits in the neighbourhood. The trade is mainly in these products and in wine and saffron. The Danube harbour of Krems is at the adjoining town of Stein (4299). Population, with suburbs (1890), 10,584; (1900), 12,657, including a garrison of 1755.

Kremsier (Czech, *Kroměříž*), a town in Moravia, Austria, with a special charter, 37 miles east by north of Brunn. Its industries include the manufacture of machinery and iron-founding, brewing and corn-milling, and there is a considerable trade in corn, cattle, fruit, and manufactures. Population (1890), 12,480; (1900), 13,991, including a garrison of 1065.

Kreuzburg, a town of Prussia, province of Silesia, 24 miles north-north-east of Oppeln. It was the birth-place of Gustav Freytag (1816-1895). Here are flour-mills, distilleries, iron-works, breweries, &c.; also a provincial lunatic asylum and a teachers' seminary. Population (1885), 6578; (1900), 10,236.

Kreuznach, a town and watering-place of Prussia, in the Rhine province, on the river Nahe, and 9 miles

by rail south of Bingen. In the school of the old town is preserved a collection of Roman and mediæval antiquities. Here was discovered in 1893 a finely-preserved Roman mosaic. A statue of Bismarck (1897) adorns the old town. Its saline waters attract some 6000 persons annually. Population (1885), 16,414; (1900), 21,334.

Kriegspiel, or the "WAR GAME," is of German origin, as its name indicates. The positions of troops are marked on maps, movements are made under regulations, and the whole or portions of past campaigns can be reproduced in outline of fair accuracy, or hypothetical manoeuvres may be formulated for study and instruction. The materials required are at least three copies of the same map, drawn to such scale as may be suitable to the magnitude of the operations to be represented. If the scheme is one for small numbers of troops, maps of large scale are essential, as small features of the ground largely influence the action of small bodies, and it is only on large-scale maps that the real influence of small features can readily be appreciated. Conversely, with large bodies, maps on a diminished scale are convenient. A great amount of detail is necessary in all maps drawn for military purposes; heights as represented by contours, roads, buildings, water-courses, fences, and the nature of the ground, all enter into the question of the feasibility or the reverse of military operations; and where the map is the actual field of manoeuvre, the features of the natural field must be adequately supplied. Blocks, cut or moulded to scale, represent the different units of the combatants; and colours, generally red and blue, distinguish friend from foe. Some pairs of dividers and a few measures of the same scale as the maps employed complete the material outfit. Printed regulations for the conduct of kriegspiel are of small value; and although rules have been drafted at various times and in many languages, they have generally been allowed to lapse, practice having proved that the decision of a competent umpire is of more value, as to the soundness or unsoundness of a military manoeuvre, than a code of regulations which inevitably lack elasticity.

The usual course of procedure varies but little in the different countries in which the system has been employed. The central map screened from the view of the combatants is used by the umpire, who places on it the forces of both sides; copies are on either hand behind screens or in adjoining rooms, and on them representative blocks are placed in positions which agree with the information possessed by each respective commander. A scheme is formulated such as may occur in war, and a "General Idea" or "Narrative" is the common property of both sides. This contains those items of common knowledge which would be in the possession of either commander in the field. The General Idea is supplemented by "special ideas," issued one to each of the combatants, supplying the information which a commander might reasonably be expected to have of the details of his own force. A third series of instructions is issued, entitled "Orders," which define to each commander the object to be attained; and on receipt of these he is required to draft specific orders, such as, in manoeuvre or in war, would be considered necessary for issue to field units in the assumed circumstances. Up to this point the instruction is strictly parallel to service conditions, but from the moment the umpire or an assistant moves a unit, falsity may supervene; armies on the map move without hitch or breakdown, but it is the exception, not the rule, for movements of real bodies to be carried on without unforeseen delay. The units of artillery, cavalry, infantry, or train-waggons, advance or retreat at a rate approximately regulated to their normal pace. Information gained by advancing patrols is brought at realistic speed to its destination; and no alteration in the ordered movements of a unit is allowed, till expiration of the calculated time for the transmission of the intelligence and for the issue of fresh orders. So the exercise progresses, each movement is marked, and periodically the blocks on the three maps are placed as they would be at a simultaneous moment. Smaller units yield to larger ones of the enemy; equal forces, if unassisted by superiority of position, "contain" one another, and are practically neutralized till reinforcements arrive and equilibrium is overthrown.

The decisions of the umpire are all-important, and it is he who

makes or mars the value of the instruction. Some axioms must be universally accepted for the guidance both of himself and of the players. A force arrayed within effective range on the flank of an equal and hostile force has the better position of the two. Artillery in position with an unimpeded glacis is a terrible task for a frontal attack. Cavalry, as such, is ineffective in woodlands, marshes, or a country broken up by cross hedges or wire fencing. Infantry in masses is an ideal target for efficient artillery, and in scattered bodies affords opportunities for attack by well-handled cavalry. The just application of the ideas contained in these few sentences to the varying stages of a combat is no mean task for a cultured student.

One of many difficulties encountered in war is the lack of accurate information. Any one man's view of details spread over large areas of country is extremely limited; and even with the greatest precautions against unreality, a commander's information is vastly more accurate over the extended units of his mimic force at kriegspiel, than when the forces so represented are men, horses, and machines, wrapped in dust or in smoke, and partially obscured by accidents of the ground too insignificant for reproduction on the map. Yet whilst accepting a certain unreality in kriegspiel, and to a less degree in field manoeuvres, both by one and the other military training and education are furthered. The framing of orders follows identical lines at kriegspiel, at manoeuvres, or in war. The movement of troops in mimic warfare should be brought to harmonize as far as possible with reality. The study of past campaigns, laboriously traced through maps and records, matured the prowess of commanders of such various calibres as Frederick, Napoleon, Wellington, and von Moltke. The reproduction on the kriegspiel map of the strategy of Napoleon's campaigns in 1796 and in 1815 shows a similarity of design. In either case he commanded a central force acting against the inner flanks of allies, whose base-communications were divergent. In 1796 the Piedmontese and the Austrians conformed to Napoleon's preconceived idea and retired eccentrically. In the Waterloo campaign, Blucher, with loyal heroism, abandoned his own communication and rallied to his ally. War here differentiated the efficiency gained or lost by good or bad moral force, but it is difficult on paper to reproduce similar conditions. The paralysing effect caused by a flanking assault on an attacking force may be indicated at kriegspiel, yet it is impossible to gauge theoretically the amount of its efficacy. A force in position to threaten communications may be placed on the map, but Osman at Plevna delayed the Russian advance to an extent altogether unforeseen. Von Moltke supervised kriegspiel exercises for the general staff of the German army, and printed records exist of various problems he suggested, orders issued by the selected commanders, and finally the searching criticisms by the field-marshal himself. The concentrating march of the armies on Paris was probably analysed in detail between 1866 and 1870, and treated as a strategical problem on the map, but no seer could have prophesied tactical incidents such as the capture and recapture of Le Bourget or the combats on the plateau of Châtillon. It may be stated with confidence that the measured movements of troops over a kriegspiel map, and the necessary drafting of orders, are aids to the acquisition of military proficiency; but directly the contact of important bodies of troops is represented on paper, imagination, not realism, governs the results. (J. B. S.)

Krishnagar, a town of British India, headquarters of Nadia district in Bengal, situated on the left bank of the river Jalangi, connected with Ranaghat, on the Eastern Bengal railway, by a light railway, 20 miles in length, which was opened in 1899. Population (1881), 27,477; (1891), 25,500. It is the residence of the rajah of Nadia. Coloured clay figures are manufactured. The Government college had 83 pupils in 1896-97; there is a collegiate high school, with 194 pupils.

Kristo Das Pal (1838-1884), Indian publicist, was born in Calcutta in 1838, and after receiving an English education at the Oriental Seminary, was appointed assistant secretary to the British Indian Association in 1885. It was an association of Bengal landlords founded about the middle of the 19th century, and numbered among its members some of the most cultured men of the day, such as Raja Radha Kanta Dev, a patron of Sanskrit learning and head of the Orthodox community; Prosonno Kumar Tagore, the most successful lawyer of his time; Ram Gopal Ghosh, the most gifted speaker and most patriotic representative of his countrymen; Debendra Natu Tagore, head of the Brahmo Somaj; Joy Kishen Mukerjee, an able, far-sighted, practical landlord; Digambar Mitra, another clear-headed and influential landlord; Rajendra Lal Mitra, the distinguished antiquary and scholar; Mahendra Lal Sarkar, favourably known in India for his scientific researches. Three years after his appointment as assistant-secretary, Kristo Das Pal became editor of the *Hindu Patriot*, originally started in 1853 and conducted with ability and zeal by Harish Chandra Mukerji until his death in 1861. When Kristo Das Pal became editor, the journal was transferred by a trust deed in 1862 to some members of the British Indian Association, and henceforth became to some extent an organ of that body. Thus from 1862 Kristo Das Pal had rare opportunities for distinction, and proved his abilities and independence during an eventful career of twenty-two years until his death. Among the publicists who helped and co-operated with him were Maharaja Sir Jotendra Mohan Tagore and Maharaja Sir Narendra Krishna Dev, scions of the two most distinguished houses of Calcutta. In 1863 Kristo Das Pal was appointed justice of the peace and municipal commissioner of Calcutta. In 1872 he was made a member of the Bengal Legislative Council, where his practical good sense and moderation were much appreciated by successive Lieutenant-Governors of Bengal. His opposition, however, to the Calcutta Municipal Bill of 1876, which first recognized the elective system, was attributed to his prejudice in favour of the "classes" against the "masses." In 1883 he was appointed member of the Viceroy's Legislative Council. In the discussions on the Rent Bill, which came up for consideration before the Council, Kristo Das Pal, as secretary to the landlords' association, necessarily took the side of the landlords. He died on 24th July 1884. (R. C. D.)

Krivoi Rog, a town of Russia, government of Kheron, on Ingulets river, near to the station of the same name on the Ekaterinoslav railway, 133 miles north-east of Nikolayev. It is the centre of a district, very rich in metals and various minerals obtained from a narrow stretch of crystalline schists underlying the Tertiary deposits. Iron ores (60 to 70 per cent. of iron), copper ores, colours, brown coal, graphite, slate, and lithographic stone are obtained. Population (1895), 9811.

Krivosćie, a small stretch of barren mountainous country, forming part of the Dinaric alpine region, bounded on the S. by the Bocche di Cattaro, in the Austrian crownland of Dalmatia, and on the N.W., N., and E. by Herzegovina and Montenegro. The district, which is inhabited by Servians, has been in the possession of Austria since 1814. It was the scene of two revolts (in 1869 and from December 1881 to March 1882), consequent upon the efforts of the Austrian Government to enforce military service upon the inhabitants. A number of forts have now been erected in the district. Population (1890), 27,947; (1900), 29,979, including a garrison of 2079.

Kronstadt (Hungarian, *Brassó*), a corporate town

of Hungary and capital of a county, in the extreme south-east of Transylvania, just below the Tömös Pass in the Carpathians. Population (1891), 30,739; (1900), 36,646, of whom about 12,000 were Hungarians, the others in about equal proportion Germans and Wallachians. It is an important industrial and commercial town; its trade, chiefly with Rumania and the Balkan states, is very considerable, and it has manufactures of clothes and sausages, besides distilleries and petroleum refineries. On the top of the Romantic Mount Cenk (3000 feet), near the town, stands one of the monuments, erected (in 1896) at several parts of the country, to commemorate the millennium of the Hungarian state.

Kruger, Stephanus Johannes Paulus (1825—), formerly President of the Transvaal Republic, was born in Colesberg, Cape Colony, on 10th October 1825. The founder of the Kruger family appears to have been a German named Jacob Kruger, who in 1713 was sent with others by the Dutch East India Company to the Cape. Mr Kruger's father was Caspar Jan Hendrick Kruger, who was born in 1796, and whose wife bore the name of Steyn. At the age of ten Paul Kruger—as he afterwards came to be known—accompanied his parents in the migration, known as the Great Trek, from the Cape Colony to the territories north of the Orange in the years 1835–40 (see SOUTH AFRICA). From boyhood his life was one of adventure. Brought up on the borderland between civilization and barbarism, constantly trekking, fighting, and hunting, his education was necessarily of the most primitive character. He learnt to read and to write, and was taught the narrowest form of Dutch Presbyterianism. His literature was almost confined to the Bible, and the Old Testament was preferred to the New. It is related of Mr Kruger, as indeed it has been said of Piet Retief and others of the early Boer leaders, that he believed himself the object of special Divine guidance. At about the age of twenty-five he is said to have disappeared into the veldt, where he remained alone for several days, under the influence of deep religious fervour. During this sojourn in the wilderness Mr Kruger stated that he had been especially favoured by God, who had communed with and inspired him. Throughout his life he professed this faith in God's will and guidance, and much of his influence over his followers is attributable to their belief in his sincerity and in his enjoyment of Divine favour. The Dutch Reformed Church in the Transvaal, pervaded by a spirit and faith not unlike those which distinguished the Covenanters, was divided in the early days into three sects. Of these the narrowest, most puritanical, and most bigoted was the Dopper sect to which Mr Kruger belonged. His Dopper following was always unswerving in its support, and at all critical times in the internal quarrels of the state rallied round him. The charge of hypocrisy, frequently made against Mr Kruger—if by this charge is meant the mere juggling with religion for purely political ends—does not appear entirely just. The subordination of reason to a sense of superstitious fanaticism is the keynote of his character, and largely the explanation of his life. Where faith is so profound as to believe the Divine guidance all, and the individual intelligence *nil*, a man is able to persuade himself that any course he chooses to take is the one he is directed to take. Where bigotry is so blind, reason is but dust in the balance. At the same time there have been incidents in Mr Kruger's life which but ill conform with any Biblical standard he might choose to adopt or feel imposed upon him. Even van Oordt, his eloquent historian and apologist, is cognizant of this fact.

At the age of seventeen Paul found himself an Assistant

Field Cornet, at twenty he was Field Cornet, and at twenty-seven Commandant in an expedition against a native chief Sechele. In 1853 he took part in another expedition against Montsioa. When not fighting natives in those early days Mr Kruger was engaged in distant hunting excursions which took him as far north as the Zambezi. In 1852 the Transvaal secured the recognition of its independence from Great Britain in the Sand River Convention. For twenty years after this date the condition of the country was one bordering upon anarchy, and into the faction strife which was continually going on Mr Kruger freely entered (see TRANSVAAL). In 1857 he joined Pretorius in a conspiracy for abolishing the district governments in the Transvaal and substituting one central government. What was styled a Representative Assembly was summoned at Potchefstroom in order to arrange a new constitution. At the same time Pretorius, accompanied by Commandant Paul Kruger, led an expedition into the Free State, where, with the help of a malcontent faction within its borders, they hoped to overthrow the Free State Government and compel a federation between the two countries. The invading commando was met on the Rhenoster river by President Boshof, in command of the Free State forces. Finding that even in the Transvaal his action against the Free State had excited the strongest resentment, and that General Schoeman was coming down from Zoutpansberg to assist President Boshof, Pretorius decided to withdraw. Commandant Kruger then bore a flag of truce to President Boshof and arranged terms of peace, which included an apology from the Pretorius party for the invasion. The blackest incident in connexion with this invasion is the fact that the Pretorius and Kruger party had actually sent emissaries to Basutoland to induce the Basutos to rise and harass the Free State forces behind, while they were attacking them in front.

From this time forward Mr Kruger's life is so intimately bound up with the history of his country, and even in later years of South Africa, that a study of that history is essential to an understanding of it (see TRANSVAAL and SOUTH AFRICA). The years which followed the abortive invasion of the Free State in 1857 were years of continual unrest and faction strife in the Transvaal. In this strife Mr Kruger played a leading part, and showed very little scruple or broad patriotism so long as his party might prevail. In 1864, when Pretorius was president, Kruger was elected commandant-general of the forces of the Transvaal. In 1871 a boundary dispute arose with the British Government, which was settled by the Keate award. The decision caused so much discontent in the Transvaal that it brought about the downfall of President Pretorius and his party; and Burgers, an educated Dutch minister, resident in Cape Colony, was elected to succeed him. During the term of Burgers's Presidency, which terminated with the British annexation in 1877, Kruger appeared to great disadvantage. Instead of loyally supporting the President in the difficult task of reducing chaos to order and establishing some sort of civilized government in the Transvaal, he did everything in his power to undermine his authority, even going so far as to urge the Boers to pay no taxes while Burgers was in office. In fact, there is no question that the faction of which he was a prominent member was chiefly responsible for bringing about that *impasse* in the government of the country which drew such bitter protest from Burgers and terminated in the annexation by the British in 1877. At this period of Transvaal history it is impossible to trace any true patriotism in the action of the majority of the inhabitants. The one idea of Kruger and his faction was to oust Burgers from office on any pretext,

and, if possible, to put Kruger in his place. When the downfall of Burgers was assured and annexation offered itself as the alternative resulting from his downfall, it is true that Mr Kruger opposed it. But matters had gone too far. Annexation became an accomplished fact, and Mr Kruger accepted paid office under the British Government. He continued, however, so openly to agitate for the retrocession of the country, accompanying two deputations to England, that Sir Theophilus Shepstone, the British administrator, dismissed him from his service. In 1881 the Boer rebellion occurred, and Kruger was one of the famous triumvirate, of which General Joubert and Pretorius were the other members, who, after Majuba, negotiated the terms of peace on which the Pretoria Convention of 1881 was subsequently drafted. In 1883 he was elected President of the Transvaal, receiving 3431 votes as against 1171 recorded for Joubert.

In November 1883 President Kruger again visited England, this time for the purpose of getting another Convention. The visit was successful, the London Convention, which for years was a subject of subsequent controversy, being granted by Lord Derby in 1884 on behalf of Her Majesty's Government. The government of the Transvaal being once more in the hands of the Boers, the country rapidly drifted towards that state of national bankruptcy from which it had only been saved by annexation in 1877. In 1886, the year in which the Rand mines were discovered, President Kruger was by no means a popular man even among his own followers; as an administrator of internal affairs he had shown himself grossly incompetent, and it was only the specious success of his negotiations with the British Government which had retained him any measure of support. In 1888 he was elected President for a second term of office. In 1889 Dr Leyds, a young Hollander, was appointed state secretary, and the system of state monopolies around which so much corruption grew up was soon in full course of development. The principle of government monopoly in trade being thus established, President Kruger now turned his attention to the further securing of Boer political monopoly. The Uitlanders were increasing in numbers, as well as providing the state with a revenue. In 1890, 1891-92, and 1894 the franchise law (which at the time of the Convention was on a liberal basis) was so modified that all Uitlanders were practically excluded altogether. In 1893 Mr Kruger had to face a third Presidential election, and on this occasion the feeling in the country was so strong that it was fully anticipated that his more liberal opponent, General Joubert, would be elected. The votes actually returned were 7911 for Kruger and 7246 for Joubert. Before the Presidential election Mr Kruger had taken care to conciliate the Volksraad members, as well as to see that at all the Volksraad elections, which

occurred shortly before the Presidential election, his supporters were returned, or if not returned, that his opponents were objected to on some trivial pretext, and by this means prevented from actually sitting in the Volksraad until the Presidential election was over. At this time the Hollander and *concessionnaire* influence had become a strong power in the state, and was all in favour of President Kruger. In spite of these facts, the election was nominally a close one, and there was a general belief that Joubert was elected. General Joubert accused the Government of tampering with the returns, and appealed to the Volksraad. The appeal, however, was fruitless. The action taken by President Kruger at this election, and his previous actions in ousting President Burgers and in absolutely excluding all Uitlanders from the franchise, all show that at any cost, in his opinion, the Government must remain a close corporation, and that while he lived he must remain at the head of it. It was a blind, reckless, and unscrupulous policy, which inevitably led to disaster.

After the Jameson Raid in December 1895 President Kruger put off Sir Hercules Robinson, as well as the reformers in Johannesburg, with promises that the Uitlander grievances should be seriously considered and dealt with. But no sign of keeping this promise was given.

In 1898 Mr Kruger was elected President of the Transvaal for the fourth and last time. In 1899 relations between the Transvaal and Great Britain had become so strained that a conference was arranged at Bloemfontein between Sir Alfred Milner, the High Commissioner, and President Kruger. Mr Kruger was true to his principles. At every juncture in his life his object had been to gain for

PAUL KRUGER.

(From a photograph by Elliott and Fry, London.)

himself and his own narrow policy everything that he could, while conceding nothing in return. It was for this reason that he invariably failed to come to any arrangement with Brand while the latter was President of the Free State. In all his negotiations with Great Britain after 1881 Mr Kruger had invariably gained something. All the energies of the Boer President were centred on his intrigues for obtaining complete independence of Great Britain, and for ignoring the whole spirit, if not the letter, of the Conventions. In 1889, the very year following President Brand's death, he was able to make a treaty with President Reitz, his successor, which bound each of the Boer Republics to assist the other in case its independence was menaced, unless the quarrel could be shown to be an unjust one on the part of the state so menaced. In effect it bound the Free State to share all the hazardous risk of the reckless anti-British Transvaal policy, without the Free State itself receiving anything in return. Mr Kruger thus achieved one of the objects of his life. With such a history of apparent success, it is not to be wondered at that the Transvaal President came to

Bloemfontein to meet Sir Alfred Milner in no mood for concession. After hearing the very moderate franchise proposal of Sir Alfred Milner, he made his counter proposals. These included a treaty of arbitration, and the incorporation of Swaziland and Zambiansland (which would have included a piece of the coast-line) with the Transvaal. The negotiations fell through, as in the temper in which President Kruger entered upon them they were bound to do. It is true that he made an ostensible offer of concession on the franchise question, but even that proposal was made dependent on so many conditions that it was a palpable sham. Every proposition which Sir Alfred Milner made was met by the objection that it threatened the independence of the Transvaal. This retort was President Kruger's rallying cry whenever he found himself in the least degree pressed, either from within or without the state. To admit Uitlanders to the franchise, to no matter how moderate a degree, would destroy the independence of the state; and the same argument had been used in 1897 to rouse the extreme section of his followers into opposition to the report of the Industrial Commission (a commission of Mr Kruger's own nominees), who reported in a sense adverse to his exclusive and monopolist policy. In October 1899, after a long and fruitless correspondence with the British Government, war with Great Britain was ushered in by an ultimatum from the Transvaal. Immediately after the ultimatum Natal and the Cape Colony were invaded by the Boers both of the Transvaal and the Free State. Yet one of the most memorable utterances made by Mr Kruger at the Bloemfontein Conference was couched in the following terms: "We follow out what God says, 'Accursed be he that removeth his neighbour's landmark.' As long as your Excellency lives you will see that we shall never be the attacking party on another man's land." The course of the war that followed is described under TRANSVAAL. In 1900, Bloemfontein and Pretoria having been occupied by British troops, Mr Kruger fled the country and proceeded to Europe, where he endeavoured to induce the European Powers to intervene on his behalf, but without success. Mr Kruger was thrice married, and had a large family; his second wife died in 1891, his third wife in 1901. When he fled to Europe he left his wife in Lord Roberts's custody at Pretoria, but she gradually failed, and died there. It is recorded that when the statue to President Kruger at Pretoria was erected, it was by Mrs Kruger's wish that the hat was left open at the top, in order that the rain-water might collect there for the birds to drink.

Krumau, or KRUMMAU, an old town in Bohemia, on the Moldau, 14 miles south-west by south of Budweis, marking the northern limit of the German border of Bohemia at this point. A château of Prince Schwarzenberg, with interesting archives, occupies a prominent position on a rock overlooking the river. The town has a considerable inland trade and an important textile industry (linen yarn, cloth, and cashmeres), steam sawmills and cornmills, limekilns and breweries, and manufactures paper, cellulose, &c. Population (1890), 8331; (1900), 8673, chiefly Germans.

Krupp, Alfred (1812–1887), German inventor, and founder of the celebrated steel works and gun factory at Essen, was born on 26th April 1812, at that town, where his father, Friedrich Karl Krupp, had set up a small foundry, which, after his death in 1826, was carried on by his widow. Alfred, as the eldest son, found himself com-

pelled, at the age of fourteen, to leave school and take the direction of the works. The prospect was a cheerless one. His father had spent a considerable fortune in the vain attempt to cast steel in large blocks; and, in order to keep the works going at all, the family had to live with the utmost frugality, while the youthful director worked side by side with his workmen by day, and spent great part of the night carrying on the experiments begun by his father. Even so, for the next fifteen years the returns were never more than sufficient to cover the workmen's wages. In spite of all, Krupp never lost confidence in the practicability of his father's schemes. In 1841 his invention of the spoon-roller brought in sufficient money to enable him to enlarge his factory and spend money on casting steel blocks. In 1847 he made his first cannon of cast steel. At the Great Exhibition of 1851 in London he exhibited a 6-pounder cannon made entirely of cast steel, and a solid flawless ingot of steel weighing 2000lb, more than twice as much as any previously cast. Krupp's exhibit caused a sensation in the engineering world, and the Essen works at once sprang into fame. In 1851 another successful invention, this time in the making of railway tyres, supplied a profit, which was devoted partly to the enlargement and equipment of the factory, and partly to the execution of his long-cherished scheme—the construction of a breech-loading cannon of cast steel. Krupp himself was strongly convinced of the superiority of breech-loaders to muzzle-loaders, on account of the greater accuracy of firing and the saving of time; but his view did not win general acceptance in Germany till after the Franco-German war, when the army was supplied throughout with Krupp's perfected field-piece. When once the excellence of its work was recognized, the factory developed with amazing rapidity. At the time of Alfred Krupp's death (on 14th July 1887) he employed 45,000 men, and, including those in works outside Essen, his rule extended over no less than 75,000 persons. To all these he performed the part of a father. Special "colonies" were built for the employés and their families, with parks, libraries, schools, and recreation grounds, while the widows' and orphans' fund and other philanthropic and benefit schemes ensured the men and their families against anxiety in case of illness or death. After a time the fame of the Essen works attracted large numbers of visitors, and princes vied with one another in conferring distinctions on the "Cannon King," the informal title which alone their owner cared to bear. He declined to be ennobled, for he gloried in the name his own work had made celebrated; thirty-five Orders had been bestowed upon him, but he never wore one. After his death the works were carried on by his only son, Friedrich Alfred, who continued his father's beneficent rule and the inherited tradition of conscientious work and flawless material.

(A. Z.)

Kuba, Old (*Kudial-kaleh*), a district town of Russia, Transcaucasia, government and 95 miles north-west of Baku, on the route to Derbent, on Kudial-chai river; altitude, 1990 feet. It was founded in the 17th century, and annexed to Russia in 1806. The chief occupation of the inhabitants is the silk-worm culture and the fabrication of plain silk stuffs and carpets. Population (1897), 15,346.

Kubañ (*Kubanskaya Oblast*), a province of Russia, North Caucasia, having the Sea of Azov on the W., the province of Don Cossacks on the N., Stavropol and Terek on the E., and Kutais and Tehernomorsk on the S. and S.W. It thus contains the low and marshy lowlands on the Sea of Azov, the western portion of the fertile plains of northern Caucasia, and the northern slopes of the Caucasus range from its north-west extremity to the Elbruz. The

main range, which reaches a height of 9200 feet in the group of peaks of Oshten, and gradually rises to 18,572 feet in the Elbruz, is thickly snow-clad between these two peaks, and very few passes lead from the province of Kubañ to the Black Sea littoral. (See CAUCASUS.) In its southern parts the province includes the parallel ranges known as the Black Mountains, from 3000 to 6000 feet high, intersected by gorges growing deeper and wilder as one approaches the main range. Owing to a relatively wet climate and a profusion of rivers, these mountains are thickly clothed with woods, under the shadow of which a thick underwood of rhododendrons, "Caucasian palms" (*Buxus sempervirens*), ivy, clematis, &c., develops, so as to render the forests almost impassable. They cover altogether nearly 20 per cent. of the aggregate area. Wide treeless plains, from 1000 to 2000 feet high, spread farther north, and are profusely watered by the many tributaries and sub-tributaries of the Kubañ—Little and Great Zelenchuk, Urup, Laba, Pshish—rushing through narrow gorges from the Caucasus range, and spreading fertility in the plains. In its lower course the Kubañ, which is a river nearly 500 miles long, as it approaches the Sea of Azov subdivides into a labyrinth of branches, and enters both the Sea of Azov (main branch in the 15th century) and the Black Sea, forming a wide delta, low, covered with rushes, peopled by boars, and very unhealthy. The same character is maintained by the low plains in the east of the Azov Sea, covered with numerous semi-stagnant lakes. Fishing is the chief wealth of this part of the province, the Achueff fisheries on the Kubañ being famous. Malaria is the enemy of these regions, and is specially deadly on the Tamañ peninsula, as also along the left bank of the lower and middle Kubañ.

There is considerable mineral wealth in the province. Coal is found on the Kubañ and its tributaries, but its extraction is still insignificant (less than 10,000 tons per annum). Naphtha wells exist in the district of Maikop, but the best are in the Tamañ peninsula, where they cover an area of 570 square miles. The yearly extraction of naphtha (begun in 1866) reaches now about 50,000 tons. Iron ores, silver, and zinc are found; alabaster is extracted, as also some salt, soda, and "Epsom" salt. The best mineral waters are at Psekup and Tamañ, where there are also numbers of mud volcanoes, which appear of all sizes, ranging from small hillocks to hills 175 feet and 365 feet high (Aktaniz, or Kukuoba), and even higher. They all throw out mud, stones, roots of plants, &c. The soil is very fertile in the plains, parts of which are covered with black earth and are being rapidly populated.

The population reached 1,926,323 in 1897, of whom 1,788,622 are Russians, 8000 Poles, 13,095 Armenians, and 11,410 Germans. There were 945,873 women, and only 156,486 lived in towns. The aborigines were represented by 103,516 Cherkesses and 5000 Nogai Tatars. The Cherkesses or Adyge (Kabardians, Besleneis, Abadzekhs, &c.), who formerly occupied the mountain valleys, were compelled, after the conquest in 1861, either to settle in the flat land or to emigrate, those who refused to move being driven across the mountains to the Black Sea coast. Most of them (nearly 200,000) emigrated to Turkey, where they formed the Bashi-bazouks. Peasants from the interior provinces of Russia occupied the plains of the Kubañ, and now they number over 1,000,000, while the Kubañ Cossacks number 804,372 (405,428 women).

The area under crops has rapidly extended of late, the cereal crop of 1897 being 6,729,000 quarters (8,000,000 in 1894). Wheat is by far the chief crop (nearly three-quarters of the total area under crops are under wheat); rye, oats, barley, millet, Indian corn, some flax and potatoes, as also tobacco (133,000 cwts.), are also grown. Agricultural machinery is largely resorted to, and the province becomes a reserve granary for Russia. There were in 1894, 188,700 horses, 983,600 horned cattle, 1,213,000 sheep, and 25,600 goats. Bee-keeping is general, and gardening and vine-growing are rapidly spreading. Fishing in the Black Sea and Azov Sea, as also in the Kubañ, is important. Industrial pursuits give occupation to a little over 21,000 people (yearly returns about £1,200,000 only).

Two main lines of railway intersect the province, one running north-west to south-east, from Rostoff to Vladikavkaz, and another starting from the former south-westwards to Novorossiysk.

Schools have been introduced since 1863, and there were in 1897, besides the gymnasia in the chief towns, 364 primary schools (many having model gardens or farms), with 31,244 pupils, and 435 church schools (15,600 pupils). The province is divided into 7 districts (*otdyels*), the chief towns of which are Ekaterinodar, capital of the province (65,697), Anapa (6676), Armavir, chief town of Labinsk (6388), Batalpashinsk (5866), Maikop (34,191), Temryuk (14,476), and Yeisk (35,446). The territory of the Kubañ Cossacks (see COSSACKS) is divided into 11 military districts. (P. A. K.)

Kuchinoerabujima, an island belonging to Japan, measuring 8 miles in length by 2½ in breadth, and lying to the south of Kiushiu, in 30° 3' N. and 130° 10' E. Its highest peak, Shindake, measures 2313 feet.

Kuenen, Abraham (1828–1891), Dutch theologian, the son of an apothecary, was born on 14th September 1828, at Haarlem, where he was educated at the primary school and gymnasium. On his father's death, which took place before the boy was fifteen, it became necessary for him to leave school and take a humble place in the business. Happily old friends, who recognized the lad's ability, arranged to pay for his education first at the gymnasium and afterwards at the University of Leyden, where he was destined to spend the rest of his life. He studied theology, and won his doctor's degree by an edition of thirty-four chapters of Genesis from the Arabic version of the Samaritan Pentateuch. In 1853 he became "extraordinary" professor of theology at Leyden, and in 1855, when he became full professor, he married a daughter of Muurling, one of the founders of the Groningen school, which made the first pronounced breach with Calvinistic theology in the Reformed Church of Holland. Kuenen himself soon became one of the main supports of the modern theology, of which Scholten and Opzoomer were the chief founders, and of which Leyden became the headquarters. His first great work, a *Historico-Critical Introduction to the Old Testament*, followed the lines of the dominant school of Ewald. But before long he came under the influence of Colenso, and learned to regard the prophetic narrative of Genesis, Exodus, and Numbers as older than what was by the Germans denominated "Grundschrift" (*Book of Origins*). In 1869–70 he published *The Religion of Israel*. This was followed in 1875 by *A Study of Hebrew Prophecy*, largely polemical in its scope, and specially directed against those who rest theological dogmas on the fulfilment of prophecy. In 1882 Kuenen came to England to deliver a course of Hibbert lectures on Natural and Universal Religion; in the following year he presided at the Congress of Orientalists held at Leyden. In 1886 his volume on the Hexateuch was published in England. He died at Leyden on 10th December 1891. Kuenen was also the author of numerous articles, papers, and reviews; a series on the Hexateuch, which appeared in the *Theologisch Tijdschrift*, of which he was joint-editor, is one of the finest products of modern criticism. A distinguishing characteristic of the man was his great courtesy, which never failed him even in the most animated controversy, and which set the tone in Holland, where the polemical acrimony so common in many countries is little known. Kuenen was a great admirer of England, which he visited three times, once to meet Colenso, another time as a delegate to the British and Foreign Unitarian Association, and the last time in 1882, when he lectured at London and Oxford. Several of his works have been translated into English by Mr Philip Wicksteed. (A. Z.)

Kuen-lun, a geographical term which was used at a time when the geography of Central Asia was almost totally unknown, and which is still partly retained. The ancients used to imagine an immense range of mountains

crossing Asia from west to east, on the parallel of the island of Rhodos, and separating the rivers which flow towards the Arctic Ocean from those which flow southwards. Humboldt, influenced by his own and Klaproth's studies of Chinese sources, represented Asia as covered with a network of mountain ranges running along the parallels and the meridians; and among the former he represented the Kuen-lun as a sort of backbone of Asia, "the highest and longest mountain range on the earth," crossing Asia from west to east in its middle parts. Ritter, guided by his keen geographical genius, saw in the Kuen-lun a northern border-ridge of the Tibetan plateau which, together with the Tian-shan mountains, nearly parallel to it, encloses the "high valley" (*Hochthal*) or plateau of the Western Gobi or Chinese Turkestan (*Asien*, ii. 409); farther east, he added, following Klaproth, it penetrates as a high snow-clad range between the upper Hoang-ho and the sources of the Yangtse-kiang. This was the right conception. However—following Humboldt—the geographers in the middle of the 19th century, such as Berghaus in his *Physikalischer Atlas* (edition of 1852: "Bergketten von Asien und Europa"), traced a succession of mountain ranges running west to east, from the Bosphorus to the 100th degree of longitude. This line passed along the south coast of the Black Sea through Asia Minor, the Anti-Caucasus, and the Kopet-dagh, which were connected farther east, by hypothetical ranges traced across Afghanistan and the Pamirs (*q.v.*), with the northern border ranges of the Tibetan plateau (Russian range, Altyn-tagh, and Nan-shan highlands of modern maps); and still farther east Berghaus continued it, though not without some hesitation (see Text, *Geologie*, p. 4), in the region of the sources of the Blue river. The "Kuen-lun Onëta or Kulkun" was thus a high range running from the Pamir to the sources of the Ya-long river, as a sort of continuation of a similar range running from the Pamir to the Bosphorus. Richthofen, in his *China*, vol. i., 1876, made a notable change in this representation of the Kuen-lun. The northern border range of the Tibetan plateau (which exists in reality, as is now known, as Russkiy Range and Altyn-tagh) did not appear on his map, and the Kuen-lun was represented as a complex system of numerous parallel ranges, all running along slightly curved lines almost west to east (crossing the 35th parallel under an angle of about 15°), from the Pamir plateau to the 115th meridian. Richthofen thus gave an orographic picture far more remote from reality—such as we now know it—than even the picture given in 1852 by Berghaus.

Humboldt's broad generalizations, notwithstanding their hypothetical character, and Ritter's far more correct inductions, based on a careful description, greatly stimulated research in Central Asia; and owing to the investigations of the Pundits, Carey, Dalgleish, Rockhill, Littledale, the prince of Orleans, and Bonvalot, Dutreuil-de-Rhins in Central Asia, Richthofen and Szecheny in the Far East, Bower and Thorold, and especially the series of Russian expeditions inaugurated by Prjevalsky and continued by Pyevtsoff, Roborovsky, and Kozloff, Potanin, the brothers Grum-Grzmailo, Grombchevskiy, Bogdanovich, Obrucheff, and Skassi, we are now able to construct a more or less correct map of the region over which the Kuen-lun used to be traced. It appears that ranges of mountains of very different geographical aspect and origin have been huddled together by early geographers under the general name of Kuen-lun, which name is now restricted on modern maps ("Asien," in Stieler's Atlas, the maps of the Russian general staff) to the northern border ranges of the Tibetan plateau—thus including the Keriya range in the meridian of Khotan, the Russkiy Khrebet, and the Altyn-tagh (or Astyn-tagh).

As to the partially explored highlands around the sources of the Hoang-ho, the region which extends farther east to the 110th meridian, the short ranges Min-shan, Hsi-king-shan, and Tsin-ling-shan, represented by Wegener as continuing the Kuen-lun beyond the 104th meridian, in accordance with Richthofen's views—the whole region has assumed a quite different aspect since the surveys of the Russian explorers of this region have become known. Instead of these ranges we see the escarpments of the south Mongolian plateau facing the plains of China, and running in a north-westerly direction to meet the escarpments of In-shan and the Great Khingan (*q.v.*); while in the upper courses of the Hoang-ho, the Yangtse-kiang, and the Mekong we find three vast ranges—Burkhan Budha, and two as yet unnamed—which run distinctly from the north-west to the south-east, between and parallel to these three rivers, as appears from the last expedition of Kozloff.

It may also be added that modern exploration has given a quite different aspect to the mountains of Western Asia as well. Thus we see the mighty Hindu Kush running south-west to north-east to join the Pamirs, and (instead of Berghaus's Manish Koh and Korgan) we have the plateau of Afghanistan fringed and intersected by ranges having the same south-west to north-east direction; the Kopet-dagh appears as the border range of the Iran plateau running north-west to south-east, and the Elburz and the Anti-Caucasus escarpments have the same direction; while the Pontic range at the south-east corner of the Black Sea runs south-west to north-east to join the main Caucasus range (see CAUCASUS). Thus instead of a supposed west-to-east direction for all these mountains, we find two distinct directions, south-west to north-east, and north-west to south-east, or west-north-west to east-south-east, of which—if a suggestion by analogy be permitted—the latter would be of a much younger (Secondary and Tertiary) origin than the former, as they have been shown to be in the Tian-shan by Mushketoff.

The mountain ranges which are found in Central Asia in about the 36th degree of latitude, between the Pamir plateau and the 95th degree of longitude, and which were formerly described under the vague name of Kuen-lun, belong to several quite distinct systems of mountains. It is now known that the mountains which limit the Pamirs on the east—Kashgar mountains, Sarykol—have the character of a formidable border range, which goes down on the one side to the high plains (3900 to 4500 feet) of Eastern Turkestan, but on the other, or south-western side, has its foot on the high Pamir swelling 10,500 to 13,000 feet above sea-level. These mountain ranges have a definite direction from north-west to south-east. They rise far above the snow-line, which lies at a level of from 18,000 to 20,000 feet, and reach their highest point in the Muztagh-ata massive, which consists of gneisses and granites, and they give origin to several glaciers, which descend to the 13,000 feet level. One, and south of the Muztagh-ata two, parallel snow-clad ranges run in the same direction from 39° 20' to 36° 30' N., meeting there the north-eastern end of the Hindu Kush, and giving origin to the Kyzyl-su, the Yarkand-daria, and the Raskem-daria. The upper parts of these rivers are now known to flow in longitudinal valleys at the south-west foot of the above ranges until they pierce them, to escape into Kashgaria. The few passes across these mountains lie at heights of from 14,800 to 16,340 feet (Kara-tash). Under the name of Chung-kyr, these mountains, retaining still their south-easterly direction, reach 78° 30' long. The *Muz-tagh* range (between the Shimshal and the upper Raskem), beginning in 37° N., runs in the same direction, parallel to them, but nearer to the Himalaya (see map of Kanjut, the Raskem, and the Sary-kol by the Russian general staff). On the eastern slopes of the Kashgar mountains the Russian geologist, Bogdanovich found the same red rocks with marine fossils which Stoliczka considered in 1874 as belonging to the Triassic age, though they proved to be Upper Devonian (corals, *Stromatopora*, *Bryozoa*, *Atrypa reticularis*, *A. latilinguis*, and *A. aspera*, *Spirifer Verneuli*, &c.). This important discovery settles also the age of the fossiliferous rocks which Stoliczka found farther south in the Kilian mountains at the issue from the Sanju pass. They also must be Devonian.

From 78° 30' E. to 51° E. a range of mountains—the Kilian, or the Khotan, or Keriya mountains—runs in a west-north-west to east-south-east direction, representing a mighty snow-clad border

ridge, of which the northern foot rests on the high plains of East Turkestan, 4300 to 4500 feet, while its southern, or rather south-west foot, lies on the shoulder of the north-west Tibetan plateau, 15,000 to 16,500 feet. It is in this range that Stoliczka found, at an altitude of nearly 6000 feet, the *Gryphaea* fossils which he considered Triassic, and upon which such wide speculations about a Central Asian Mediterranean were based later. They belonged, however, to the Upper Devonian age (Bogdanovich). The passes through these mountains rise but a few hundred feet above the high plains of Tibet, and the range has more the character of an escarpment than of a true mountain-chain. The Muz-tagh continues to run nearly parallel to it from north-west to south-east, 100 miles farther to the south-west, raising its peaks to heights of 21,350 to 28,870 feet, and ending on the Tibetan plateau about the 79th meridian. It is to this part of the old Kuen-lun (the Kilian, Khotan, and Keriya mountains) that the name of Kuen-lun is now restricted on many modern maps.

The next division of the North Tibetan border range, which faces East Turkestan, has a quite different direction, namely, from south-west to north-east, which direction becomes west-south-west to east-north-east beyond the 89th meridian. Prjevalsky has named these mountains *Russian Range* (Russkij Khrebet; Ak-kar-chekytagh), while the eastern portion of the same border range is known as the *Altyn-tagh*, or, more properly, *Astyn-tagh*, according to Bogdanovich; however, the former name is more widely used by cartographers. The Russian range consists mostly of two parallel ranges, one of which is covered with snow. Its north-western foot is in East Turkestan, at an altitude of from 4700 (Keriya) to 4100 feet (Cherchen oasis), while its other foot stands on the inconceivably dreary, stony deserts of the Tibetan plateau, which have an altitude equal to that of high European mountains, *i.e.*, about 16,000 feet. In 86° E. a range named Akka-tagh, and, farther east, Prjevalsky's range, runs nearly due east until it strikes the Jin-ri Peak, or Monomakh's Crown (20,000 feet), in the Columbus ridge, which crosses the Tibetan plateau from north-west to south-east.

A longitudinal valley separates the Russian range from the western end of the Altyn or Astyn-tagh, which decreases in altitude (11,000 to 9300 feet) beyond 92° E. It fringes the Tsaidam plateau, which is only 8000 to 9500 feet high, and consequently lower than the preceding portion of the Tibetan plateau. From this latter the Tsaidam plain is separated by the Tsaidam, Columbus, Marco-Polo, Garynga, and Torai mountains, all running north-west to south-east.

The *Tibetan plateau* is intersected in fact by several ranges of mountains, which run either south-west to north-east or north-west to south-east, and thus divide it into rhomboidal divisions, having something of the shape of Bohemia, though on a much larger scale, and representing, so far as our present knowledge goes, terraces, at various altitudes, of these high and massive swellings of the earth's crust. The Tsaidam (or Chaidam) has also that rhomboidal shape. To a great extent it is the bottom of an immense interior lake, now covered with clayey and salty deposit.

The *Nan-shan Highlands* limit the Tsaidam on the north-east. They embrace a territory 380 miles long and 260 miles wide (about 99,000 square miles), entirely filled with parallel mountain ranges all running from the north-west to the south-east. Plains and plain-like longitudinal valleys, having their flat bottoms at altitudes of 12,000 to 14,000 feet (occasionally 11,150 feet, and 9200 to 9900 at the south-western border) and interspersed with lakes (Kuku-nor, 10,500 feet; Khara-nor, 13,280 feet, and several small ones), fill up the space between these mountain ranges. In the south-east the Nan-shan highlands reach the highlands of the Chinese province of Kan-su, and near the sharp bend of the Hoang-ho at Si-ang-fu (province Shen-si) they meet the escarpments by which the great Kbingan and the Su-Shan are continued, and by which the Mongolian plateau sinks down to the lowlands of China. On the north-east the Nan-shan highlands have their foot on the level—about 4000 feet on the average—of the Mongolian plateau, *i.e.*, in the Ala-shan. On the north-west they are fringed by a border range, the Da-sue-shan, which is a continuation of the Altyn-tagh, from 12,200 to 13,000 feet high in its passes, and pierced by several rivers flowing to Lake Khalachi. This border range, which continues on to the 97th meridian, separates the Nan-shan from the plains of the Bei-shan (see MONGOLIA), 4100 to 5000 feet high.

The results of the Russian Tibetan expeditions, combined with those of Szecheny, Michaelis, Loczy, and Rockhill, have revealed the true structure of the Nan-shan highlands. Their south-western borders—that is, the mountains which rise along the north-eastern border of the Tsaidam—consist of short irregular chains, interrupted by large plains, which are sprinkled with lakes, and differ but slightly in altitude from the Tsaidam itself. Next comes a succession of narrow mountain ranges which separate this lower border terrace from the higher one (12,000–13,500 feet). The first mountain range on this higher

terrace is Ritter's range, covered in 38° 20' N. and 96° E. with formidable snow-fields. The passes at both ends of this snow-clad massive lie at altitudes of 15,990 feet and 14,680 feet respectively. The next range is Humboldt's or Amarsurgu range, which runs north-west to south-east from the Altyn-tagh to about 38° N., and is perhaps continued by the southern Kuku-nor range, which reaches the Hoang-ho (7440 feet on the banks of the river) at Gui-de-tin. It includes, in fact, several other parallel ranges—Mushketoff's, Semenoff's, Suess's, Alexander III.'s, Bain-sarlyk, &c.—the mutual relations of which are, however, not yet definitively settled, and consequently Grum-Grzimalo (in his article "Nan-shan" in the Russian *Encyclopaedic Dictionary*) is perhaps right in describing this portion of the highlands singly as *Central Nan-shan*.

Small lateral chains of mountains, rising some 2000 feet above the general level of that plateau, and owing their origin to erosion, connect the central Nan-shan with the next parallel ranges, which may be described as *Eastern Nan-shan*. The mutual relations of the latter, as well as the names of its different chains, are equally unsettled. Thus, one of them is named indiscriminately Nan-shan, Richthofen's range, or Momo-shan; while another, which runs parallel to the north-eastern slope of the preceding, is named T'holo-shan, or T'holo-Nan-shan, or northern Tetung. In fact, the region is filled by three different ranges of nearly equal height, all rising above the snow-line in many of their peaks. Finally, there is a range of mountains, about 10,000 feet high, named Lung-shan by Obrucheff, which fringes the north-eastern side of the Hang-chu-fu valley, and belongs also to the Nan-shan system. But the string of oases in the Kan-su province, which stretches between the Lung-shan and the preceding range, lies, however, on the lower level of the Mongolian plateau (4000 to 5000 feet).

Generally speaking, the Nan-shan highlands are a wide region raised to from 12,000 to 14,000 feet above the sea, and intersected by a succession of wild, stony, and partly snow-clad mountains, towering another 4000 to 7000 feet above its surface, and arranged in a system of narrow parallel chains all running north-west to south-east. The chains of mountains are from 8 to 17 miles wide, seldom as much as 35, while the broad, flat valleys between them attain widths of from 20 to 27 miles. As a rule the passes are at an altitude of from 12,000 to 14,000 feet, and the peaks reach from 18,000 to 20,000 feet in the western portion of the highlands, while in the eastern portion they may be about 2000 feet lower. The glaciers also attain a greater development in the western portion of the Nan-shan, but the valleys are dry, and the slopes of both the mountains and the valleys, furrowed by deep ravines, are devoid of vegetation. Good pasture grounds are only found near the streams. The soil is a dry gravel and clay, upon which bushes of *Ephedra*, *Nitraria*, and various *Salsolaceae* grow wide apart. In the north-eastern Nan-shan, on the contrary, a stream runs in each gorge, and both the mountain slopes and the bottoms of the valleys are clothed with vegetation. Woods of conifers (*Picea obovata*) and deciduous trees—Prjevalsky's poplar, birch, mountain ash, &c., and a variety of bushes—appear everywhere. Higher up, in the picturesque gorges, one finds rhododendrons, willows, *Potentilla fruticosa*, *Spiraea*, *Lonicerae*, &c., and the rains must evidently be more copious and better distributed. In the central Nan-shan only the north-eastern slopes are covered with forests. In the south, where the Nan-shan enters the Kan-su province, wide accumulations of loess make their appearance, and it is only the northern slopes of the hills that are clothed with trees.

The largest water basin of the Nan-shan is *Lake Kuku-nor* (altitude about 13,500 feet), which is about 65 miles long and 40 miles wide, and attains in the south a depth of 59 feet. Its water is salt (0.0111 per cent. of salts). It receives the Bukhaingol and about 25 other streams, but has no outflow. It is closely surrounded by mountains, but good alpine meadows reach its shores and cover a neighbouring hilly plateau. Rain seems to fall upon its shores in much greater abundance than upon the mountains. Numerous animals, especially the wild donkey (*Asinus kiang*) and the antelope (*Antilope Cuvieri*), breed on these meadows, and Tanguts, perhaps also Mongols, graze them with their numerous herds. Two species of fish, belonging to the *Schizopygopsis* and *Diplophysa* genera, are found in its waters. Numbers of eagles (*Haliaeetus Macei*), gulls (*Larus ichthyotus*, *L. brunneicephalus*), and Indian geese, *Casarca rutilla*, and *Podiceps cristatus*, are attracted to its shores; but, probably owing to the lake being frozen from November till the end of March, and to the absence of reeds, few birds visit it during their migrations.

The region situated between 95° and 99° E., as far as lat. 29°, was explored by Kozloff in 1900 and 1901. It appears that south of the Tsaidam the country forms a high plateau, the average level of which lies at 12,000 to 13,000 feet (lower levels are only found in the deeply trenched valley of the Blue River and its tributaries), while four vast snow-clad ridges cross the surface of

the plateau from north-west to south-east, reaching in their passes altitudes of 15,500 to 16,000 feet, and lifting their peaks 500 to 600 feet above the passes. The north-western border ridge of this plateau is formed by the Burkhan-budha and the Amne-machin, which confront the Tsaidam, with snow-clad, deeply furrowed peaks, that rise 8000 to 9000 feet above its surface. The other three ridges run due north-west to south-east between the upper courses of the Hoang-ho, the Yang-tse-kiang, the Mekong, and the upper Salween. Farther south-westwards, approaching lat. 29°, we enter a region where the monsoons begin to make their influence felt, and the country assumes more and more the character of an alpine region, with all the differentiations which are characteristic of such regions—this being due to the more pronounced erosion. The valleys are deeply sunk into the plateau, as much as 9000 feet at the confluence of the Blue river and the Sy-chu; and the climate grows much milder down in the valleys, and the vegetation becomes accordingly more varied. In all probability this plateau, with its parallel ranges of mountains, joins some huge but as yet unexplored escarpment which connects the Himalaya with the Great Khingan.

In the case of the so-called Eastern Kuen-lun, it is sufficient to look at the modern maps of the Russian general staff which embody Skassi's surveys and the recent materials (map of the Kan-su expedition, corrected in 1891 in Potanin's work), to see that Richthofen's and Wegener's representations of that region hardly give a correct idea of its real structure. There are no mountains in this region which could be in any way connected with the Kuen-lun proper, *i.e.*, with the northern border ridge of the Tibetan plateau. On the contrary, we have from Kalgan to the 104th meridian a succession of terrace escarpments by which the South Mongolian plateau (4000 to 5000 feet of altitude) drops down to the high plains of China, 1000 to 2000 feet, and in these terraces it is impossible not to see a direct continuation of the Great Khingan. Only these terraces, edged by relatively low border ranges along their escarpments, cover here a zone over 200 miles wide (as against 100 miles, or less, in the Great Khingan, north of Peking), and assume more and more a direction east-north-east to west-south-west (east to west in the Tsun-ling escarpment?). However, neither orographically nor geologically can they be connected in any way with the border range which separates Eastern Turkestan from the North Tibetan plateau, and which is the only portion of the old "Kuen-lun" which can now retain that time-honoured name.

AUTHORITIES.—Owing to the vagueness of the conceptions attached to the term "Kuen-lun," to give its literature would mean to enumerate all the explorations carried on in Central Asia, Mongolia, and Western China for the last thirty years of the 19th century. A good enumeration of the works published before 1890, and a map of itineraries, will be found in Wegener's *Versuch einer Orogaphie des Kuen-lun*, Marburg, 1891, but his map is already out of date. The quarto publications of the Russian Geographical Society, describing the expeditions of Prjevalsky, Pyevtsoff, Roborovsky, and Kozloff, the brothers Grum-Grzimailo, Bogdanovich, Obrucheff, Potanin, and Skassi, for the so-called Eastern Kuen-lun, and of Grombchevskiy and Ivanoff for the Pamirs—in fact, all the series of *Izvestia* of the Russian Geographical Society, and of *Petermann's Mittheilungen*, since 1887—must be consulted for the itineraries of the Russian and German travellers and the maps based on their surveys, unaltered by subsequent modifications; and the *Geographical Journal* for the same years, for the same purpose as regards the English travellers. The original reports of the explorations of Sven Hedin, Bonvalot, and the prince of Orleans must be consulted for the travellers of other nationalities. Short indexes of literature will be found also in the articles "Kuen-lun," by Bogdanovich; "Nan-shan," by Grum-Grzimailo, and many others in the Russian *Encyclopædic Dictionary*.
(P. A. K.)

Kühne, Willy (1837–1900), German physiologist, was born at Hamburg on 28th March 1837. After attending the gymnasium at Lüneburg, he went to Göttingen, where his master in chemistry was Wöhler and in physiology R. Wagner. Having graduated in 1856, he studied under various famous physiologists, including du Bois-Reymond at Berlin, Claude Bernard in Paris, and Ludwig and Brücke in Vienna. At the end of 1863 he was put in charge of the chemical department of the pathological laboratory at Berlin under Virchow; in 1868 he was appointed professor of physiology at Amsterdam; and in 1871 he was chosen to succeed Helmholtz in the same capacity at Heidelberg, where he died on 10th June 1900. His original work falls into two main groups—the physiology of muscle and nerve, which occupied the

earlier years of his life, and the chemistry of digestion, which he began to investigate while at Berlin with Virchow. He was also known for his researches on vision and the chemical changes occurring in the retina under the influence of light. The visual purple, described by Boll in 1876, he attempted to make the basis of a photo-chemical theory of vision, but though he was able to establish its importance in connexion with vision in light of low intensity, its absence from the retinal area of most distinct vision detracted from the completeness of the theory and precluded its general acceptance.

Kulja (Chinese, *Ili-ho*), a territory in north-west Mongolia, belonging to the Chinese Empire; bounded, according to the treaty of St Petersburg of 1881, on the W. by the Semirychensk province of Russian Turkestan, on the N. by the Boro-khoro mountains, and on the S. by the mountains Khan-tengri, Muz-art, Terskei, Eshik-bashi, and Narat. It comprises the valleys of the Tekes (middle and lower portion), Kunghe, the Ili as far as the Russian frontier and its tributary, the Kash, with the slopes of the mountains turned towards these rivers. Its area occupies about 19,000 square miles (Grum-Grzimailo).

Physical Features.—The valley of the Kash is about 160 miles long, and is cultivated in its lower parts, while the Boro-khoro mountains are snow-clad in their eastern portion, and fall with very steep slopes to the valley. The Arshan mountains, which separate the Kash from the Kunghe, are lower, but rocky, naked, and difficult of access. The valley of the Kunghe is about 120 miles long; the river flows first in a gorge, then amidst thickets of rushes, and very small portions of its valley are fit for cultivation. The Narat mountains in the south are also very wild, but are covered with forests of deciduous trees (apple-tree, apricot-tree, birch, poplar, &c.), and pine trees. The Tekes flows in the mountains, and pierces narrow gorges. The mountains which separate it from the Kunghe are also snow-clad, while those to the south of it reach 24,000 feet of altitude in Khan-tengri, and are covered with snow and glaciers—the only pass through them being the Muzart. Forests and alpine meadows cover their northern slopes. Agriculture was formerly developed on the Tekes, as is testified by old irrigation canals. The Ili is formed by the junction of the Kunghe with the Tekes, and for 120 miles it flows through Kulja, its valley reaching a width of 50 miles at Horgos-koljat. This valley is famed for its fertility, and is admirably irrigated by canals, part of which, however, fell into decay after 55,000 of the inhabitants migrated to Russian territory in 1881. The climate of this part of the valley is, of course, continental—frosts of -22° F. and heats of 107° F. being experienced—but snow lasts only for one and a half months, and the summer heat is tempered by the proximity of the high mountains. Apricots, peaches, pears, and some vines are grown, as also some cotton-trees near the town of Kulja, where the average yearly temperature is 48.5° F. (January 15° , July 77°). Barley is grown up to an altitude of 6500 feet.

The *population* may number about 125,000, of whom 75,000 are settled and about 50,000 nomads (Grum-Grzimailo). The Taranchis from East Turkestan represent about 40 per cent. of the population; about 40,000 of them left Kulja when the Russian troops evacuated the territory, and the Chinese Government sent some 8000 families from different towns of Kashgaria to take their place. There are, besides, about 20,000 Sibos and Solons, 3500 Kara-kidans, a few Dungans, and more than 10,000 Chinese. The nomads are represented by about 18,000 Kalmyks, and the remainder by Kirghiz. Agriculture is insufficient to satisfy the needs of the popu-

lation, and food is imported from Semirychensk. Excellent beds of coal are found in different places, especially about Kulja, but the fairly rich copper ores and silver ores have ceased to be worked.

The *chief towns* are Suidun, capital of the province, and Kulja. The latter (Old Kulja) is on the Ili river, and has about 10,000 inhabitants, chiefly Taranchis. It is one of the chief cities of the region, owing to the importance of its bazaars, and is the seat of the Russian consul and a telegraph station.

History.—Two centuries B.C. the region was occupied by the fair and blue-eyed Ussuns, who were driven away in the 6th century of our era by the northern Huns. Later the Kulja territory became a dependency of Dzungaria. The Ugurs, and in the 12th century the Kara-Kidāns, took possession of it in turn. Tchinghiz Khan conquered Kulja in the 13th century, and the Mongol Khans resided in the valley of the Ili. It is supposed (Grum-Grzimalo) that the Oirats conquered it at the end of the 16th or the beginning of the 17th century; they kept it till 1756, when the Chinese annexed it. During the insurrection of 1864 the Dungans and the Taranchis formed here the Taranchi sultanate, and this led to the occupation of Kulja by the Russians in 1871. Ten years later the territory was restored to China. (P. A. K.)

Kulm, a town of Prussia, province of West Prussia, 33 miles by rail north-north-west of Thorn, on the bank of the Vistula. The existing town walls date from the 13th century. There are large oil-mills, also iron-foundries and machine shops, and manufacture of horse-shoes, as well as an important trade in agricultural produce, including fruit and vegetables. Population (1885), 9975; (1900), 11,079.

Kulmsee, a town in the province of West Prussia, Prussia, 14 miles by rail north of Thorn. It has a fine Roman Catholic cathedral (1251, restored 1422), having been down to 1823 the seat of the see of Kulm. Sugar, butter, and cheese are manufactured. Population (1900), 8987.

Kulp, a village of Transcaucasia, Russia, in the government of Erivan, district Surmalinsk, 2 miles from the Arax river. Close by is the Kulp salt mountain, about 1000 feet high, consisting of beds of clay intermingled with thick layers of rock salt, which has been worked from time immemorial. Regular galleries are cut now in the transparent, horizontal salt layers, from which cubes of about 70 lb weight are extracted to the amount of about 170,000 cwts. every year.

Kum, a small province of Persia, bounded on the N. by the province of Tehran, and on the S. by that of Kashan. It is divided into seven districts, has a population of 45,000 to 50,000, and pays a yearly revenue of about £8000. KUM, the capital, in 34° 39' N. and 50° 55' E., has an elevation of 3100 feet. It owes much of its importance to the fact that it contains the tomb of Imam Reza's sister, Fātmeh, who died there in A.D. 816, and large numbers of pilgrims visit the city during six or seven months of the year. The fixed population is about 20,000. A carriage road 92 miles in length, constructed in 1890-93, connects the city with Tehran. A very fine quality of cotton with a long staple is grown in the surrounding districts.

For full description of province and city, see *Eastern Persian Irak*, London, 1896.

Kumaon, an administrative division of British India, in the North-West Provinces. It consists of a large Himalayan tract, together with a submontane strip called the Tarai or Bhabar. Area, 13,743 square miles; population (1881), 1,046,263; (1891), 1,181,567, showing an increase of nearly 10 per cent.; average density, 85 persons per square mile, ranging from 72 in the mountains to 219 in the Tarai. In 1901 the population was 1,202,130,

showing an increase of less than 2 per cent. At the time of the census of 1891 the division was composed of the three districts of Kumaon, Garhwal, and the Tarai; but the two districts of Kumaon and Tarai have since been redistributed and renamed after their headquarters, Naini Tal and Almora. The former district of Kumaon had an area of 7151 square miles; population (1881), 493,641; (1891), 563,181, showing an increase of 14 per cent.; average density, 79 persons per square mile. Kumaon proper, with the Tarai, constituted an old Rajput principality, which became extinct at the beginning of the 19th century. The inhabitants are known as Khasias. The country was annexed after the Gurkha war of 1815, and was governed for seventy years on the non-regulation system by three most successful administrators—Mr Traill, Mr J. H. Batten, and Sir Henry Ramsay. Tea gardens cover an area of about 3000 acres.

Kumta, or COOMPTA, a town of British India, in the South Kanara district of Bombay, on the sea-coast, 40 miles south of Karwar. It has an open roadstead, with a lighthouse and considerable trade. Carving in sandalwood is a speciality. The commercial importance of Kumta has declined since the opening of the Southern Mahratta railway system. Population, 10,713.

Kumyks, a people of Turkish stem in Caucasia, occupying the Kumyk plateau (*Kumykskaya ploskost*) in North Daghestan and South Terek, and numbering (1897) about 92,400. It is supposed that Ptolemy knew them under the name of Kami and Kamaks. Various explorers see in them descendants of the Khazars. Vambéry supposes that they settled in their present quarters during the flourishing period of the Khazar kingdom, in the 8th century. It is certain that some Kabardians also settled later. The Russians built forts in their territory in 1559, and under Peter I. Having long been more civilized than the surrounding Caucasian mountaineers, the Kumyks have always enjoyed some respect among them. The upper terraces of the Kumyk plateau, which the Kumyks occupy, leaving its lower parts to the Nogai Tatars, are very fertile.

Kunar.—The Kunar valley (Khoaspes in the classics) is the southern section of that great river system which reaches from the Hindu Kush to the Kabul river near Jalalabad, and which, under the names of Tarkhun, Chitral, Kashkar, &c., is more extensive than the Kabul basin itself. The lower reaches of the Kunar are wide and comparatively shallow, the river meandering in a multitude of channels through a broad and fairly open valley, well cultivated and fertile, with large flourishing villages and a mixed population of Mohmand and other tribes of Afghan origin. Here the hills to the eastward are comparatively low, though they shut in the valley closely. Beyond them are the Bajor uplands. To the west are the great mountains of Kafiristan called Kashmund, snow-capped, and running to 14,000 feet of altitude. Amongst them are many wild but beautiful valleys occupied by Kafirs, who are rapidly submitting to Afghan rule. From 20 to 30 miles up the river on its left bank, under the Bajor hills, are thick clusters of villages, amongst which are the ancient towns of Kunar and Pashat. The latter was visited by the writer in 1895, and the old orange groves and cypress gardens of the days of Babar, with modern pavilions of the Kashmir type, were found still lingering in the beauty of decay. The chief tributary from the Kafiristan hills is the Pechdara, which joins the river close to Chagan Sarai. It is a fine, broad, swift-flowing stream, with an excellent bridge over it (part of the Amir's military road developments), and has been largely utilized for irrigation. The Pechdara finds its sources in the Kafir hills amongst forests of pine and deodar and thick tangles of wild vine and ivy, wild figs, pomegranates,

olives and oaks, and dense masses of sweet-scented shrubs. Above Chagan Sarai, as far as Arnawai, where the Afghan boundary crosses the river, and above which the valley belongs to Chitral, the river narrows to a swift mountain stream beset with boulders and hedged in with steep cliffs and difficult "parris," or slopes of rocky hillside. Wild almond here sheds its blossoms into the stream, and in the dawn of summer much of the floral beauty of Kashmir is to be found in the Kunar valley. At Asmar there is a slight widening of the valley, and the opportunity for a large Afghan military encampment, spreading to both sides of the river and connected by a very creditable bridge built on the cantilever system. There are no apparent relics of Buddhism in the Kunar, such as are common about Jalalabad or Chitral, or throughout Swat and Dir. This is probably due to the late occupation of the valley by Kafirs, who spread eastwards into Bajor within comparatively recent historical times, and who still adhere to their fastnesses in the Kashmund hills. The Kunar valley route to Chitral and to Kafirstan is being developed by Afghan engineering. It may possibly extend ultimately unto Badakshan, in which case it will form the most direct connexion between the Oxus and India, and become an important feature in the strategical geography of Asia. (T. H. H*.)

Kundt, August Adolph Eduard Eberhard (1839–1894), German physicist, was born at Schwerin in Mecklenburg on 18th November 1839. He began his scientific studies at Leipzig, but afterwards went to Berlin. At first he devoted himself to astronomy, but coming under the influence of Magnus, he turned his attention to physics, and graduated in 1864 with a thesis on the depolarization of light. In 1867 he became *privat-docent* in Berlin University, and in the following year was chosen professor of physics at the Zürich Polytechnic; then, after a year or two at Würzburg, he was called in 1872 to Strassburg, where he took a great part in the organization of the new university, and was largely concerned in the erection of the Physical Institute. Finally in 1888 he went to Berlin as successor to Helmholtz in the chair of experimental physics and directorship of the Berlin Physical Institute. He died after a protracted illness at Israelsdorf, near Lübeck, on 21st May 1894. As an original worker Kundt was especially successful in the domains of sound and light. In the former he developed a valuable method for the investigation of aerial waves within pipes, based on the fact that a finely-divided powder—lycopodium, for example—when dusted over the interior of a tube in which is established a vibrating column of air, tends to collect in heaps at the nodes, the distance between which can thus be ascertained. An extension of the method renders possible the determination of the velocity of sound in different gases. In light Kundt's name is widely known for his inquiries in anomalous dispersion, not only in liquids and vapours, but even in metals, which he obtained in very thin films by means of a laborious process of electrolytic deposition upon platinized glass. He also carried out many experiments in magneto-optics, and succeeded in showing, what Faraday had failed to detect, the rotation under the influence of magnetic force of the plane of polarization in certain gases and vapours.

Kunene, formerly known also as **NOURSE**, a river of south-west Africa, with a length of about 700 miles, mainly within Portuguese territory, but in its lower course forming the boundary between Angola and German south-west Africa. The upper basin of the river lies on the inner versant of the high plateau region which runs southwards from Bihe parallel to the coast, forming in places

ranges of mountains which give rise to many streams running south and south-west to swell the Kunene. The main head-stream rises just north of 13° S., running generally from north to south through four degrees of latitude, but finally flowing west to the sea through a break in the outer highlands. A little south of 16° S. it receives the Kalonga from the east, and in about 16° 50' the Kakulovar from the west. The Kakulovar has its sources in the Serra da Chella and other ranges of the Humpata district, but, though the longest tributary of the Kunene, is but a small river in its lower course, which traverses the arid region comprised within the lower basin of the Kunene. In 16° it is less than 10 yards wide, and about 4½ feet deep in the dry season. Between the mouths of the Kalonga and Kakulovar the Kunene traverses a swampy plain, inundated during high water, and containing several small lakes at other parts of the year. Before assuming a decided westerly course the Kunene has been reported to send one or more divergent branches towards the Etosha salt pan in the south-east, but the truth of this is not established. The river now becomes smaller in volume, entering an almost desert region with little or no vegetation. The stream is sometimes shallow and fordable, at others confined to a narrow rocky channel. The country becomes exceedingly broken, and many rapids obstruct the stream, the rocks presenting the most varied hues; but near its mouth the Kunene traverses a region of sand-hills which completely block its mouth at low water. There are indications that a former branch of the river once entered a bay to the south which seems to afford anchorage for ships. The best harbour on the coast is, however, the great Fish Bay, a little north of the mouth of the Kunene.

See COSTA LEAL in *Petermann's Mitteilungen*, No. 10, 1858.—MAYO. "Journey . . . to the River Cunene," *Proceedings Royal Geographical Society*, August 1883.—ESSEN. "Meine Reise nach den Kunene," *Verhandl. Gesells. für Erdkunde zu Berlin*, No. 2, 1897; and works by CAPELLO and IVENS. (E. H.E.)

Kungrad, an important trading town in Russian Central Asia, province of Amu-daria, in the delta of that river, 40 miles south of Lake Aral; altitude 260 feet. It is the centre of several caravan routes leading to the Caspian Sea and the Uralsk province.

Kungur, a district town of Russia, government and 58 miles south-south-east of Perm, on Sylva river and on the highway to Siberia. It has a technical school, two public libraries, and a high school for girls, besides the usual educational institutions. Tanneries and the manufacture of boots, plain gloves, leather, overcoats, &c., exported chiefly to Siberia, in which over 1000 families are engaged, are the chief industries. It has trade in tallow, and linseed is exported and tea imported direct from China. Population (1892), 12,400; (1897), 14,324.

Kun Lông, the name of a district and ferry on the Salween in the northern Shan States of Burma. Both are insignificant, but the place has gained notoriety from being the nominal terminus in British territory of the railway under construction across the northern Shan States to the borders of Yunnan. In point of fact, however, this terminus will be seven miles below the ferry and outside of Kun Lông circle. At present Kun Lông ferry is little used, and the village was burnt by Kachins in 1893. It is served by dugouts, three in number in 1899, and capable of carrying about fifteen men on a trip. Formerly the trade seems to have been more considerable, and the Burmese had a customs station on the island from which the place takes its name, but the rebellion in the great state of Theinni and the southward movement of the Kachins, as well as the Mahomedan rebellion in Yunnan, diverted the caravans to the northern route to Bhamo, which is still chiefly followed.

Kuopio, a government of Finland, Russia, which includes northern Karelia, bounded on the N.W. and N. by Uleåborg, on the E. by Olonets, on the S.E. by Viborg, on the S. by St Michel, and on the W. by Vasa. Its area covers 16,500 square miles. The surface is hilly, reaching from 600 to 800 feet of altitude in the north (Suomenselkä hills), and from 300 to 400 feet in the south. It is built up of gneisso-granites, which are covered, especially in the middle and east, with younger granites, and partly of gneisses, quartzite, and talc schists, and augitic rocks. The whole is covered with Glacial and later lacustrine deposits. The soil is of moderate fertility, but often full of boulders. Large lakes cover 16 per cent. of surface, marshes and peat bogs over 29 per cent. of the area, and forests occupy 2,672,240 hectares. Steamers ply along the lakes as far as Joensuu. The climate is severe, the average temperature being for the year 36° F., for January 13°, and for July 63°. The population, which was 305,166 in 1897 (226,130 in 1872), consists almost exclusively of Finns (less than 1600 Swedes). Only 2·3 per cent. of the whole surface is under cultivation. Rye, barley, oats, and potatoes are the chief crops, and in good years these meet the needs of the population. Nearly 38,800 tons of iron ore are extracted every year, and nearly 12,000 tons of pig iron and 6420 tons of iron and steel are obtained in ten iron-works. Engineering and chemical works, tanneries, saw-mills, paper mills, and distilleries are the chief industrial establishments. The preparation of carts, sledges, and other wooden goods is spreading as a domestic industry. There is considerable traffic on the railways which cross the government. Timber, iron, butter, furs, and game are exported. The chief towns of the government are Kuopio, Joensuu (3158), and Idensalmi (1300).

Kuopio, capital of the above government, situated on Lake Kalla-vesi, 180 miles by rail from the Kuivola junction of the St Petersburg to Helsingfors main line, and the terminus of the railway which runs south to north from Kotka (Gulf of Finland) across middle Finland. Population (1897), 9412. It is picturesquely situated, and has a cathedral, two lyceums, and two gymnasia (both for boys and girls), a commercial and several professional schools. An agricultural school is at Leväis, close by. Kuopio, in consequence of its steamer communication with middle Finland and the sea (*viâ* Saima Canal), is a centre for trade, steadily growing in importance.

Küprolü, or KUPRILI (Bulgarian *Valësa*, Greek *Vélissa*), a town of Macedonia, European Turkey, in the sanjak of Prizren and vilâyet of Salonica, situated 600 feet above sea-level, on the Vardar, and on the Salonica-Metrovitz railway, 25 miles south-east of Uskub. It has a considerable trade in cocoons. Population, 22,000.

Kúrdistán, the "country of the Kúrd," including that part of Mount Taurus which buttresses the Armenian tableland and is intersected by the Batman Su, the Bohtan Su, and other tributaries of the Tigris; and the wild mountain district, watered by the Greater and Lesser Zab, which marks the western termination of the great Iranian plateau.

Population.—The total Kúrd population probably exceeds two and a half millions, namely, Turkish Kúrd 1,650,000, Persian 800,000, Russian 50,000, but there are no trustworthy statistics. The great mass of the population has its home in Kúrdistán. But Kúrd are scattered irregularly over the country from the river Sakaria on the west to Lake Urmia on the east, and from Kars on the north to Jebel Sinjar on the south. There is also an isolated settlement in Khorassan. The tribes, *Ashiret*, into which the Kúrd are divided, resemble in some

respects the Highland clans of Scotland. Very few of them number more than 10,000 souls, and the average is about 3000. The sedentary and pastoral Kúrd, *Yerli*, who live in villages in winter and encamp on their own pasture-grounds in summer, form an increasing majority of the population. The nomad Kúrd, *Kocher*, who always dwell in tents, are the wealthiest and most independent. They spend the summer on the mountains and high plateaux, which they enter in May and leave in October; and pass the winter on the banks of the Tigris and on the great plain north of the Jebel Sinjar, where they purchase right of pasturage from the Shammar Arabs. Each tribe has its own pasture-grounds, and trespass by other tribes is a fertile source of quarrel. During the periodical migrations Moslem and Christian alike suffer from the predatory instincts of the Kúrd, and disturbances are frequent in the districts traversed. In Turkey the sedentary Kúrd pay taxes; but the nomads only pay the sheep tax, which is collected as they cross the Tigris on their way to their summer pastures.

Character.—The Kúrd delights in the bracing air and unrestricted liberty of the mountains. He is rarely a muleteer or camel-man, and does not take kindly to handicrafts. Though ignorant and unsophisticated, he is not wanting in natural intelligence. In recent years educated Kúrd have held high office under the Sultan, including that of Grand Vizier, have assisted in translating the Bible into Turkish, and in editing a newspaper. The men are lithe, active, and strong, but rarely of unusual stature. The women do not veil, and are allowed great freedom. The Kúrd as a race are proud, faithful, and hospitable, and have rude but strict feelings of honour. They are, however, much under the influence of dervishes, and when their fanaticism is aroused their habitual lawlessness is apt to degenerate into savage barbarity. They are not deficient in martial spirit, but have an innate dislike to the restraints of military service. The written literature is small, but the country is rich in traditions and legends, and in lyric and in epic poems which have been handed down from earlier times and are recited in a weird melancholy tone.

History.—When Sultan Selim I., after defeating Shah Ismail, 1514, annexed Armenia and Kúrdistán, he entrusted the organization of the conquered territories to Idris, the historian, who was a Kúrd of Bitlis. Idris found Kúrdistán bristling with castles, held by hereditary tribal chiefs of Kúrd, Arab, and Armenian descent, who were practically independent, and passed their time in tribal warfare or in raiding the agricultural population. He divided the territory into sanjaks or districts, and, making no attempt to interfere with the principle of heredity, installed the local chiefs as governors. He also resettled the rich pastoral country between Erzerúm and Erivan, which had lain waste since the passage of Timúr, with Kúrd from the Hakkiari and Bohtan districts. The system of administration introduced by Idris remained unchanged until the close of the Russo-Turkish war of 1828–29. But the Kúrd, owing to the remoteness of their country from the capital and the decline of Turkey, had greatly increased in influence and power, and had spread westwards over the country as far as Angora. After the war the Kúrd attempted to free themselves from Turkish control, and in 1834 it became necessary to reduce them to subjection. This was done by Reshid Pasha. The principal towns were strongly garrisoned, and many of the Kúrd beys were replaced by Turkish governors. A rising under Bedr Khán Bey in 1843 was firmly repressed, and after the Crimean war the Turks strengthened their hold on the country. The Russo-Turkish war of 1877–78 was followed by the attempt of Sheikh Obeidullah, 1880–81, to found

an independent Kúrd principality under the protection of Turkey. The attempt, at first encouraged by the Porte, as a reply to the projected creation of an Armenian state under the suzerainty of Russia (see ARMENIA), collapsed after Obeidullah's raid into Persia, when various circumstances led the central government to reassert its supreme authority. Until the Russo-Turkish war of 1828-29 there had been little hostile feeling between the Kúrd and the Armenians, and as late as 1877-78 the mountaineers of both races had got on fairly well together. Both suffered from Turkey, both dreaded Russia. But the national movement amongst the Armenians, and its encouragement by Russia after the last war, gradually aroused race hatred and fanaticism. In 1891 the activity of the Armenian Committees induced the Porte to strengthen the position of the Kúrd by raising a body of Kúrdish irregular cavalry, which was well armed and called Hamidieh after the Sultan. The opportunities thus offered for plunder and the gratification of race hatred brought out the worst qualities of the Kúrd. Minor disturbances constantly occurred, and were soon followed by the massacre of Armenians at Sasún and other places, 1894-96, in which the Kúrd took an active part. The Hamidieh has tended to foster aspirations for the establishment of a Kúrd principality, and having fulfilled its object, is now regarded with distrust.

Kúrdistán, in the narrower sense, a province of Persia, situated in the hilly districts between Azerbaïján and Kermánshah, and extending to the Turkish frontier on the W., and bounded on the E. by Garrús and Hamadán. In proportion to its size and population it pays a very small yearly revenue—only about £14,000—due to the fact that a great part of the population consists of wild and disorderly nomad Kúrd. Some of these nomads pass their winters in Turkish territory, and have their summer pasture-grounds in the highlands of Kúrdistán. This adds much to the difficulty of collecting taxation. The province is divided into sixteen districts, and its eastern part, in which the capital is situated, is known as Ardelán. The capital is SENENDJ, usually known as SINNAH (not Sihna, or Sahna, as some writers have it), situated 60 miles north-west of Hamadán, in 35° 15' N. and 47° 18' E., at an elevation of 5300 feet. The city has a population of about 35,000, and manufactures great quantities of carpets and felts for the supply of the province and export. Some of the carpets are very fine and expensive, rugs 2 yards by 1½ costing £15 to £20. Post and telegraph offices have been established for a number of years.

Kurgan, a district town (founded 1553) of West Siberia, on the Siberian railway, 160 miles east of Czelyabrusk, situated in a wealthy agricultural district. Owing to its position at the terminus of steam navigation up the river Tobol, it has become second only to Tyumen as a commercial centre. It has a public library, a botanic garden, and a municipal bank. The returns of its three fairs exceed £300,000 a year. It has a large trade in cattle with Petropavlovsk, and considerable export of grain,

tallow, meat, hides, butter, game, and fish. Population, 10,579.

Kuriles, a chain of small islands belonging to Japan, stretching in a north-easterly direction from Nemuro Bay, on the extreme east of the island of Ezo, to Chishima-kaikyo (Kurile Strait), which separates them from the southernmost point of Kamchatka. They lie between 44° 45' to 50° 56' N. and 145° 25' to 156° 32' E. Their coasts measure 1496 miles; their area is 6159 square miles; their total number is 32, and the names of the six principal islands, counting from the south, are Kunashiri, Shikotan, Etorofu (generally called Etorop, and known formerly to Europe as Staten Island), Onnekotan, Paramoshiri, and Shumshu. From Notsu-no-saki (Notsu Cape), the most easterly point of Nemuro province, to Tomari, the most westerly point in Kunashiri, the distance is 7½ miles, and the Kurile Strait separating Shumshu from Kamchatka is about the same width. The name "Kurile" is derived from the Russian *kurity* (smoke), in allusion to the active volcanic character of the group. The dense fogs that envelop these islands, and the violence of the currents in their vicinity, have greatly hindered exploration, so that little is known of their physiography. They lie entangled in a vast net of sea-weed; are the resort of innumerable birds, and used to be largely frequented by seals and sea-otters, which, however, have been almost completely driven away by unregulated hunting. Near the south-eastern coast of Kunashiri stands a mountain called Rausu-yama (3005 feet high), round whose base sulphur bubbles up in large quantities, and hot springs as well as a hot stream are found. On the west coast of the same island is a boiling lake, called Ponto, which deposits on its bed and round its shores black sand, consisting almost entirely of pure sulphur. This island has several lofty peaks: Ponnobori-yama near the east coast, and Chachanobori and Rurindake in the north. Chachanobori (about 7900 feet) is described by Messrs Chamberlain and Mason as "a cone within a cone, the inner and higher of the two being—so the natives say—surrounded by a lake." The island has extensive forests of conifers, with an undergrowth of ferns and flowering plants, and bears are numerous. The chief port of Kunashiri is Tomari, on the south coast. The island of Shikotan is remarkable for the growth of a species of bamboo (called Shikotan-chiku), having dark brown spots on the cane. Etorofu has a coast-line broken by deep bays, of which the principal are Naibo-wan, Rubetsu-wan, and Bettobu-wan on the northern shore, and Shikotap-wan on the southern. It is covered almost completely with dense forest, and has a number of streams abounding with salmon. Shana, the chief port, is in Rubetsu Bay. This island, the principal of the group, is divided into four provinces for administrative purposes, namely, Etorofu, Furubetsu, Shana, and Shibetomo. Its mountains are Atosa-nobori (4035 feet) in Etorofu; Chiripnupari (5009 feet) in Shana; and Moyoro-dake (3930 feet) and Atuiyadake (3932 feet) in Shibetomo. Among the other islands three only call for notice on account of their altitudes, namely, Ketô-i-jima, Rashua-jima, and Matua-jima, which rise to heights of 3944 feet, 3304 feet, and 5240 feet respectively.

Population.—Not much is known about the aborigines. By some authorities Ainu colonists are supposed to have been the first settlers, and to have arrived there *via* Yezo; by others, the earliest comers are believed to have been a hyperborean tribe travelling southwards by way of Kamchatka. The islands themselves have not been sufficiently explored to determine whether they furnish any ethnological evidences. The present population aggregates

4413, or 0·7 per square mile, of whom 555 are Ainu. There is little disposition to emigrate thither from Japan proper, the number of settlers being less than 100 annually.

History.—The three southern Kurile islands, Kunashiri, Etorofu, and Shikotan, are believed to have belonged to Japan from a remote date, but at the beginning of the 18th century the Russians, having conquered Kamchatka, found their way to the northern part of the Kuriles in pursuit of fur-bearing animals, with which the islands then abounded. Gradually these encroachments were pushed farther south, simultaneously with aggressions imperilling the Japanese settlements in the southern half of Saghalien. Japan's occupation was very far from being effective in either region, and in 1875 she was not unwilling to conclude a convention by which she agreed to withdraw altogether from Saghalien, provided that Russia withdrew from the Kuriles.

An officer of the Japanese navy, Lieutenant Gunji, left Tôkyô with about forty comrades in 1892, his intention being to form a settlement on Shumshu, the most northerly of the Kurile Islands. They embarked in open boats, and for that reason, as well as because they were going to constitute themselves their country's extreme outpost, the enterprise attracted public enthusiasm. After a long struggle, the immigrants became fairly prosperous. See *Notes on the Kurile Islands*, by Captain Snow, 1896. (F. BY.)

Kursk, a government of middle Russia, bounded on the N. by Orel, on the E. by Voronezh, on the S. by Kharkov, and on the W. by Chernigov. Area, 17,937 square miles. It belongs to the central plateau of middle Russia, of which it mostly occupies the southern slope, the highest parts being in Orel and Kaluga, to the north of Kursk. Its surface is from 700 to 1000 feet high, deeply ravined, and consequently assumes a hilly aspect in the valleys of the rivers. A regular layer of fertile loess of a yellowish colour covers the whole surface, and Kursk belongs almost entirely to the black-earth region of Russia. The flora offers a character quite distinct from that of the provinces situated to the north, not only on account of the black-earth flora which enters into its composition, but also of the plants of south-western Russia which belong to it, a characteristic which is accentuated in the southern portion of the province (V. Zinger, *Information about the Flora of Middle Russia*, in Russian). The climate is milder than that of middle Russia generally, and winds from the south-east and the south-west prevail in winter. The average temperatures are for the year 42° F., for January 14° F., and for July 67° F. The very interesting magnetic anomaly, known as the Byelgorod anomaly, covering an oval 20 miles long and 12 miles wide, near the town of this name, has been investigated by Smirnoff, Pilchikoff, Serghievskiy, and Tillo. The population (1,893,597 in 1862) was 2,396,577 in 1897, of whom 1,208,488 were women and 199,676 lived in towns. It is thoroughly Russian (76 per cent. Great Russians and 24 per cent. Little Russians), and 94 per cent. are peasants, who own about two-thirds of the land (6,808,700 acres), and live mostly in large villages. The yearly increase of population varies from 23,000 (bad crops) to 45,000 (good crops). Owing to the rapid increase of the peasantry and the small size of the allotments given at the emancipation, the holdings are now so small and the rents so high that emigration, chiefly to Siberia, is on the increase. Three-quarters of the available land is under crops, chiefly rye. Grain is exported in considerable quantities. Bees are commonly kept. There were, in 1897, 443,000 horses, 620,000 horned cattle, 1,030,000 sheep, and 300,000 swine. Factories (steam flour-mills, sugar-works, distilleries, wool-washing, &c.) give occupation to about 23,000 workers (£1,700,000 yearly returns). Domestic and

petty trades are on the increase in the villages, and new ones are introduced. More than 1,000,000 pairs of boots (£200,000), 600,000 ikons and shrines (£19,000), toys, caps, various pottery, &c., are made in the villages, but even so great numbers of peasants are compelled to go elsewhere in search of work. The province pays about £1,400,000 of direct and indirect taxes, and £90,000 of municipal and village taxes a year. Notwithstanding the active efforts of the county and district councils (*zemstvo*), less than 10 per cent. of the population read and write. The province is crossed from north to south and from west to south by two main lines of railway, having several branches. The trade in grain, hemp, hempseed oil, sheepskins, hides, tallow, felt goods, wax, honey, and leather goods is very brisk. There are fifteen districts, the chief towns of which are Kursk, Byelgorod (21,850), Dmitriev (7315), Fatezh (4959), Graivoron (7669), Korocha (14,405), Lgov (5376), Novyi Oskol (2762), Oboyañ (11,872), Putivl (8965), Rylsk (11,415), Staryi Oskol (16,662), Shchigry (3329), Sudzha (12,856), Tim (7380). Many villages, such as Borisovka (25,080), Veliko-Mikhailovka (20,700), are more important than the district towns, there being twenty-two more villages which have from 5000 to 12,000 inhabitants.

(P. A. K.)

Kursk, capital of the above province. It is built on two hills, having an altitude of 770 feet, the slopes of which are covered with orchards. It has a public garden, and has become the seat of several societies (medical, musical, educational, and for sport). Besides the usual gymnasia for boys and girls, there is a school for teachers. There are four newspapers. Its factories (steam flour-mills, distilleries, tobacco-works, hemp-crushing mills, tanneries, soap-works, iron-works) employ about 1000 workers. It has a great yearly fair (*korennyaya*), to which horses, cattle, hides, sheepskins, furs, down, bristle, wax, tallow, and all sorts of manufactured goods, making an aggregate value of \$55,000, are brought, and during which considerable commercial operations in all sorts of raw produce are concluded. Population, 52,896 (but one seemingly correct estimate puts it 62,803 for 1895).

Kurunegala, the chief town in the north-western province of Ceylon. It was in 1902 the terminus of the Northern railway (59 miles from Colombo), which was planned to run, 200 miles farther, to the northernmost coast of the Jaffna peninsula. Kurunegala is the centre of rice, cocoanut palm, tea, coffee, and cacao cultivation. The population of the town is 5300; of the district (1901), 246,618; of the province (1901), 345,427.

Kuruntwad, a native state of India, in the Deccan division of Bombay, forming part of the Southern Maharashtra Jagirs. Originally created in 1772 by a grant from the Peshwa, the state has been subdivided since 1811 between a senior and a junior branch. The territory of both is widely scattered among other native states and British districts. Area of the senior branch, 174 square miles; population (1891), 43,809; gross revenue, Rs.2,01,860; police, 114; 13 schools, with 696 pupils. Area of junior branch, 134 square miles; population (1891), 13,528; gross revenue, Rs.1,48,094; police, 72; 10 schools, with 364 pupils; joint tribute, Rs.9619. The chiefs, whose title is Patwardhan, are Brahmans by caste. The junior branch was in 1902 represented by two cousins, ruling jointly. The town of KURUNTWAD, in which both branches have their residence, is on the right bank of the Panchganga river near its junction with the Kistna. Population, 9136.

Kustanaisk, a district town of Russian Central Asia, in the province of Turgai, on the Tobol river, 600

miles east of Orenburg. It is situated in a very fertile district of the steppes (prairies), the first buildings were erected in 1871, and it has since grown with a quite American rapidity. The immigrants from Russia, attracted by the fertility of the land, built a large village which became the centre of the district administration in 1884, and a town in 1893, under the name of Nicolaevsk, changed later into Kustanaisk. It has several schools for boys and girls, a Russian and Kirghiz progymnasium for girls, a society for promoting primary education, which keeps a "church-school," two libraries—one for the peasants—and a dépôt for school-books to supply the schools of the district. A cathedral has been built by private subscription. There are already 20 tanneries, 3 tallow houses, 3 potteries, and a fair which is a centre for trade in cattle, while its trade returns are such as to make of it a rival to Orenburg and Troitsk. Population (1895), 16,136; (1897), 14,065 (settled only).

Küstendil, the chief town of a department in the principality of Bulgaria, situated in a mountainous country, on a small affluent of the Strouma, 43 miles south-west of Sofia by rail. The streets are narrow and uneven, and the majority of the houses are of clay or wood. The town is chiefly notable for its hot mineral springs, in connexion with which there are nine bathing establishments. The vine is largely cultivated in the district. Some remains survive of the Roman period, when the town was known as Pautalia, Ulpia Pautalia, and Pautalia Aurelii. In the 10th century it became the seat of a bishopric, being then and during the Middle Ages known as Velbuzd. After the overthrow of the Servian kingdom it came into the possession of Constantine, brother of the despot John Drajas, and a vassal of Turkey. In the 15th century it was known as Velbuska Banja, and more commonly as Konstantinova Banja (Constantine's Bath), from which has developed the Turkish name Küstendil. Population (1900), 12,003.

Kustendji. See **CONSTANTA**.

Küstenland, The (coastland or littoral), common name for the three crownlands of the Austro-Hungarian monarchy, Görz and Gradisca, Istria, and Trieste. Their combined area is 2976 square miles, and their population (1890) 695,384, and (1900) 755,183. They are united for certain administrative purposes under the governor of Trieste, the legal and financial authorities of which also exercise jurisdiction over the entire littoral. (See separate articles.) In 1898 the educational establishments included 3 theological seminaries, 5 gymnasia, 4 real schools, 58 technical and special schools (including those for girls), and 432 elementary schools. The latter were attended by about 72 per cent. of the children. In 1890 the percentage of illiterates was 47, an improvement of 9 per cent. on the returns of 1880. This high ratio is due chiefly to the backward condition of the Slav majority. Of the 81 periodicals and newspapers published, 54 were in Italian, 17 in Slovene, 4 in German, and 2 in Serbo-Croatian, the remainder being polyglot Greek and French. The trade of this part of the empire is concentrated in Trieste (*q.v.*). In 1898 the entire Küstenland had 378 miles of railway, nearly 3150 miles of roads, and 74 miles of navigable inland waterways. There were 190 post and 101 telegraph offices, with 752 miles of line and 2062 miles of wire. In all three crownlands, as also in Dalmatia, sea-fishing affords occupation to a large number of the inhabitants. In 1897-98 the value of the yield amounted to about £222,370. The important work of reafforesting the Karst district, which extends over portions of Görz, Gradisca, Istria, Trieste, and even Carniola, was taken up tentatively as long ago as 1866. For a number of years

small grants were made for experimental planting, which since 1875-76 has been proceeded with in a more systematic and more thorough fashion. Between 1881 and 1887 special reafforesting commissions were formed, and provided with funds contributed partly by the State and partly by the crownlands concerned. The results thus far are considered very satisfactory. Politically, the situation in the Küstenland is characterized by the bitter strife between the Slav majority and the dominant Italian element, which turns mainly on the efforts of the former to secure educational facilities in their own language. The animosity between the two nationalities is as great as that between the Czechs and Germans.

See RUTHNER. *Das Küstenland und das Königreich Dalmatien*. Vienna, 1880.—JACKSON. *Dalmatia, the Quarnero and Istria, with Cettinje and the island of Grado (and Aquileja)*. Oxford, 1887. (Æ. O'N.)

Kutaiah, or **KUTAYA**, a town of western Asia Minor, connected by a branch line with the main line, Eski-shehr-Afiün Kara-hissar, of the Anatolian railway.

Kutais, a government of Transcaucasia, Russia, on the Black Sea. Area, 14,082 square miles. The province consists of four distinct parts: (1) the lowlands, watered by the Rion, and continued to the north-west, along the sea-shore, by the narrow strip of Samurzakañ and Abhazia; (2) the slopes of the main Caucasus range; (3) the western slopes of the Suram mountains, which separate Kutais from the eastern portion of the great Transcaucasian valley occupied by the province of Tiflis; and (4) the slopes of the Little Caucasus, as well as a portion of its plateau, watered by the Chorokh and its tributary, Ajaris-tskhali, which formerly constituted the Batum province. The main range, on the frontiers of the province, has many high snow-clad peaks, of which the Dykh-tau (17,054 feet), the Shkhara (17,049 feet), and the Adish (16,291 feet) are the main ones. More than 50 glaciers of the first class are already known on the southern slopes of this portion of the main range. Many secondary ridges and spurs shoot off the main range, forming narrow high valleys (see **CAUCASUS**). The Suram mountains reach only from 3000 to 4000 feet of altitude, while the Ajar-Akhaltzykh ridge of the Little Caucasus attains from 8500 to 9343 feet in its highest peaks, and is crossed by a picturesque pass, Zekari (about 8000 feet), leading to the watering-place of Abbas-tuman. The districts of Batum and Artvin in the south-west are filled up by the spurs of the Pontic range, 9000 to 11,243 feet high (peak Karchkhal), the Arsian ridge separating them from the plateau of Kars. Deep gorges, through which tributaries of the Chorokh rush to the main river, intersect these highlands, forming most picturesque gorges in their upper courses. The lowlands occupy over 2400 square miles. They are mostly in the littoral region, but extremely fertile higher up the Rion.

Granites, gneisses, and crystalline slates enter into the composition of the main range, with Palæozoic, Jurassic, and Cretaceous deposits in its lower parts. The Suram mountains consist, on their western slopes, chiefly of granites and gneisses, while the highlands of the Little Caucasus consist almost exclusively of lower Tertiary deposits. The *climate* is very moist and warm. The winters are often without frost at all in the lowlands, while the lowest temperatures ever observed are 18° Fahr. at Batum and 9° at Poti. The mountains condense the moisture brought by the west winds, and the yearly amount of rain varies from 50 to 120 inches. The chief rivers are the Rion, which enters the Black Sea at Poti; the Chorokh, which enters the same sea at Batum; and the Ingur, the Kodor, and the Bzyb, also flowing into the Black Sea in Abhazia. The vegetation is extremely rich, its character suggesting the sub-tropic regions of Japan. The *population* belongs almost entirely to the Kartvelian or Georgian group, and is distributed as follows:—Imeretians, 45 per cent.; Mingrelians and Lazes, 23 per cent.; Gurians, 8 per cent.; Georgians, 1.5 per cent.; Svanes, 1.5 per cent.; of other nation-

alities there are 6·5 per cent. of Abkhazians, 3 per cent. of Turks, 2 per cent. of Armenians, 0·5 per cent. of Russians, and so on: 87 per cent. of the population are Greek Orthodox, and only 10 per cent. Mussulmans. The total population was 1,075,861 in 1897, of whom 508,468 were women and 77,702 lived in towns. In some districts the density was 104 inhabitants per square mile. The land, among both landlords and peasants, is extremely subdivided, and, owing to an excellent cultivation, fetches very high prices. The chief crops in 1896 were Indian corn, 1,600,000 quarters; wheat, 124,000 quarters; barley, 47,000 quarters; *panicum italicum*, beans, rye, hemp, potatoes, and tobacco. Indian corn is exported. Some plantations of cotton-trees have also been laid down. The vine, olive, mulberry, and all sorts of fruit trees are cultivated, as also many exotic plants (eucalyptus, cork-oak, camellia, and even tea). Manganese ore is the chief mineral, and is extracted for a considerable export (160,000 to 180,000 tons every year), besides coal, lead, and silver ores, copper, naphtha, some gold, lithographic stone, marble, &c. Factories are still in infancy. A railway runs from the Caspian Sea, *via* Tiflis and the Suram tunnel, to Kutais, and thence to Poti and Batum, and from Kutais to the Kvirili coal and manganese mines. The export of both local produce and goods shipped by rail from other parts of Transcaucasia is considerable, Batum and Poti being the two chief ports of Caucasia. It is divided into 7 districts, of which the chief towns are Kutais, capital of the province (32,492); Lailashi (834), chief town of Legchum, of which Svanetia makes a separate administrative unit (*pristavstvo*); Ozurgeti (4694); Oni, chief town of Racha; Senak (101); Kvirili, of Sharopan district; Zugdidi; and 3 semi-military districts—Batum (28,512), Artvin (6622), and Sukhum-kale (7809).

(P. A. K.)

Kutais, capital of the above province, situated on both banks of the Rion (480 feet in altitude), and connected by a branch railway (5 miles) with the main line. It is well provided with gymnasia and other schools for boys and girls, has a school of gardening, a public library, book-shops, a large champagne factory, &c. Population, 32,492, of whom about 16,000 are Kartvelians, 3000 Armenians, 3000 Jews, and 2000 Russians.

Kutno, a district town of Russian Poland, government and 83 miles west of Warsaw by rail. It has several woollen, linen, wool-knitting and printed cotton factories, and distilleries, and is the centre of a considerable trade in corn. Population (1895), 11,665, two-thirds of whom were Jews.

Kuttenberg, a mining town and seat of the administration of a government district in Bohemia, and a station on the Austrian North-Western railway, 40 miles east by south of Prague. An iron-foundry constitutes the chief addition to the industry of the place, which includes sugar-refining, brewing, the manufacture of cotton and woollen stuffs, leather goods and agricultural implements. On 12th–16th September 1899 it was the scene of a sensational trial of a Jew named Hilsner on a charge of so-called "ritual murder," which was made the starting-point of an anti-Semitic agitation. Population (1890), 13,563; (1900), 14,799, mostly Czech.

Kuty, a town in the government district of Kosów, Galicia, Austria, 35 miles west of Czernowitz. The principal industry is the manufacture of morocco leather, which, together with the pitch, tar, and rosin recovered in the neighbouring woods, form its principal articles of export. Population (1890), 6353; (1900), 6702, mostly German-speaking Jews. The adjoining village of Kuty Stare, or Old Kuty, has a population of 4425, mostly Ruthenians.

Kuznetsk, two district towns of Russia. 1. European Russia, government and 150 miles north-north-east of Saratov, 74 miles by rail east of Penza. It has grown rapidly since the development of the railway system in the Volga basin. It has manufactures of agricultural machinery and hardware, in a number of small factories and workshops, besides tanneries, rope-works, boot- and shoe-making in houses, and there is considerable trade in grain, salt, and a variety of wooden goods exported to the treeless regions of south-east Russia. Population

(1897), 23,849. 2. In West Siberia, Altai region, government and 210 miles south-east of Tomsk, on upper Tom river, of which it is the head of the navigation. It has trade in grain, cattle, furs, cedar, nuts, wax, and honey, and tallow is shipped northwards. It is the centre of an important mining district. Population, 8980.

Kwangchow Bay, or KWANGCHOW WAN, a coaling station on the south coast of China, acquired, along with other concessions, by the French Government in April 1898. It is situated on the east side of the peninsula of Lienchow, in the province of Kwangtung, and directly north of the island of Hainan. It is held on lease for 99 years on similar terms to those by which Kiaochow is held by Germany, Port Arthur by Russia, and Wei-hai-wei by Great Britain. The cession includes the islands lying in the bay; these enclose a roadstead 18 miles long by 6 miles wide, with admirable natural defences and a depth at no part of less than 33 feet. The bay forms the estuary of the Ma-Tshé river, navigable by the largest men-of-war for 12 miles from the coast. The limits of the concession inland were fixed in November 1899. On the left bank of the Ma-Tshé France gained from Kao Chow Fu a strip of territory 11 miles by 6 miles, and on the right bank a strip 15 miles by 11 miles from Lei Chow Fu. The country is well populated; the capital and chief town is Lei Chow. The cession carries with it full territorial jurisdiction during the continuance of the lease. In January 1900 it was placed under the authority of the Governor-General of Indo-China, who in the same month appointed a civil administrator over the country, which was divided into three districts. A mixed tribunal has been instituted, but the local organization is maintained for purposes of administration. In addition to the territory acquired, the right has been given to connect the bay by railway with the city and harbour of Ompon, situated on the west side of the peninsula, and in consequence of difficulties which were offered by the provincial government on the occasion of taking possession, and which compelled the French to have recourse to arms, the latter demanded and obtained exclusive mining rights in the three adjoining prefectures. Two lines of French steamships call at the bay. By reason of the great strategic importance of the bay and the possibilities of considerable commercial development in the country, owing to the presence of large coal-beds in the near neighbourhood, much importance is attached by the French to the acquirement of Kwangchow Wan.

Kwanza, a river of West Africa, with a course of about 700 miles, entirely within the Portuguese territory of Angola. The actual source has not yet been visited, but probably lies in about 13° 40' S., on the Bihe plateau, at an altitude of over 5000 feet. The Portuguese travellers Capello and Ivens reached in 1878 a point in 13° 3' S., where they heard of a lake called Mussombo, from which the stream was supposed to rise; but they were unable to reach it. Just north of 12° they found the Kwanza about 60 yards wide and 13 to 16 feet deep. From this point to 10°, during which interval it flows north-westwards, receiving many tributaries, especially the Loando from the east, its course is imperfectly known. In about 10°, and at intervals during its westerly passage through the outer plateau escarpments, its course is broken by rapids, the river flowing in a well-defined valley flanked by higher ground. The lowest fall is that of Kambamba, or Livingstone, with a drop of 70 feet, below which it is navigated by small steamers, though very shallow in the dry season. There is a shifting bar at its mouth, which can only be crossed with great caution, but as a railway now runs from

St Paul de Loanda to Ambaca, the use of the river as a waterway has become of less importance.

See ALEXANDERSON. "On the River Quanza," *Journal R. G. S.*, 1876.—CAPELLO and IVENS. *From Benguela to . . . Yacca.* London, 1882.

(E. HE.)

Kyaukpyu, a district in the Arakan division of Lower Burma, on the eastern coast of the Bay of Bengal. In 1891 the population numbered 163,832, of whom 145,223 were Buddhists and Jains, 13,882 aborigines (mostly Chins), 4301 Mahommedans, 290 Hindus, and 136 Christians (91 of whom were natives); in 1901 it was 167,594, showing an increase since 1891 of 2·3 per cent. There were in 1898-99, 1105 villages in the district, paying a revenue of Rs.4,73,035. Of a total area of 2,807,680 acres, the area cultivated in 1898-99 was 137,559. The rainfall in 1898-99 was 17·645 inches. The chief town, Kyaukpyu, had a population in 1891 of 3549. It has a municipal committee of twelve members, three *ex officio*, and nine appointed by the local government, and there is a third-class district jail. Ramri is also a municipal town. It had a population in 1891 of 3317. Kyaukpyu is a port under the Indian Ports Act (X. of 1889), and the steamers of the British India Navigation Company call there once a week going and coming between Rangoon and Calcutta. There were 106,549 gallons of earth-oil produced in 1898-99 from the Kyaukpyu oilwells. The amount has remained nearly stationary for some years.

Kyauksè, a district in the Meiktila division of Upper Burma, with an area of approximately 1273 square miles, and a population in 1891 of 126,622, and in 1901 of 141,296. It is also known as the *Ko-kayaing*, so called from the original nine canals of the district. The district consists of a generally level strip running north and south at the foot of the Shan Hills, and of a hilly region rising up these hills to the east, and including the Yeyaman tract, which lies between 21° 30' and 21° 40' N. and 96° 15' and 96° 45' E., with peaks rising to between 4500 and 5000 feet. This tract is rugged and scored by ravines, and is very sparsely inhabited. The Panlaung and Zawgyi rivers from the Shan States flow through the district and are utilized for the numerous irrigation canals. Notwithstanding this, much timber is floated down, and the Panlaung is navigable for small boats all the year round. Rain is very scarce (26·03 inches, 1898-99), but the canals supply ample water for cultivation and all other purposes. They are said to have been dug by King Nawrahtā in 1092. He is alleged to have completed the system of nine canals and weirs in three years' time. Others have since been constructed. Since the annexation many were in serious disrepair, but most of them have been greatly improved by the construction of proper regulators and sluices. Two-thirds of the population are dependent entirely on cultivation for their support, and this is mainly rice on irrigated land. In the Yeyaman tract the chief cultivation is *taungya* or hill rice. The great bulk of the population is pure Burmese, but in the hills there are a good many Danus, a cross between Shans and Burmese. In 1891 the classification according to religion was—Buddhists and Jains, 122,771; Mahommedans, 3133; Hindus, 528; and Christians, 190. The railway runs through the centre of the paddy-producing area, and feeder roads open up the country as far as the Shan foothills. The greater part of the district consists of state land, the cultivators being tenants of Government, but there is a certain amount of hereditary freehold. The total area of cultivated state land is 137,100 acres, and of non-state land 68,205 acres. KYAUKSÈ town is situated on the Zawgyi river, and is well laid out in regular streets,

covering an area of about a square mile. It has a population of approximately 7201, mostly Burmese, with a native-of-India trading colony. Above it are some bare rocky hillocks, picturesquely studded with pagodas.

Kyd, Thomas (1558-1594), one of the most important of the Elizabethan dramatists who preceded Shakespeare, remained until the last decade of the 19th century in what appeared likely to be impenetrable obscurity. Owing to the industry, however, of certain English and German scholars, a great deal of light has been thrown on the life and writings of Kyd. He is now known to have been the son of Francis Kyd, citizen and scrivener of London, and to have been baptized in the church of St Mary Woolnoth, Lombard Street, on 6th November 1558. His mother, who survived her son, was named Agnes or Anna. In October 1565 Kyd entered the newly-founded Merchant Taylors' School, where Edmund Spenser and Thomas Lodge must at different times have been his school-fellows. It is thought that Kyd did not proceed to either of the universities; he certainly followed, soon after leaving school, his father's business as a scrivener. But Nash describes him as a "shifting companion that ran through every art and throve by none." He was very early attracted to literature and the stage. Newton's translation of Seneca, printed in 1581, had, without question, a strong influence on the imagination and style of Kyd. Professor Boas has made a very interesting analysis of the traces of contemporary literature to be found in Kyd's existing writings. It is believed that he produced his famous play, *The Spanish Tragedy*, about 1586; the earliest surviving quarto is undated. This drama enjoyed all through the age of Elizabeth and even of James I. and Charles I. so unflagging a success that it has been styled the most popular of all old English plays. Certain expressions in Nash's preface to the 1589 edition of Greene's *Menaphon* may be said to have started a whole world of speculation with regard to Kyd's activity. Much of this is still very puzzling; nor is it really understood why Ben Jonson called him "sporting Kyd." In 1592 there was added a sort of prologue to *The Spanish Tragedy*, called *The First Part of Jeronimo*, not printed till 1605. This is not regarded by the latest critics of the dramatist as being his work. On the other hand, it becomes more and more certain that what German criticism calls the *Ur-Hamlet*, the original draft of the tragedy of the Prince of Denmark, was a lost work by Kyd, probably composed by him in 1587. This theory has been very elaborately worked out by Professor Sarrazin, and confirmed by Professor Boas; these scholars are doubtless right in holding that traces of Kyd's play survive in the first two acts of the 1603 First Quarto of *Hamlet*, but in our opinion they go too far in attributing much of the actual language of the last three acts to Kyd. Kyd's next work was in all probability the tragedy of *Soliman and Perseda*, written perhaps in 1588 and published in 1592. No copy of the first edition has come down to us; but it was reprinted after Kyd's death, in 1599. In the summer or autumn of 1590 Kyd seems to have given up writing for the stage, and to have entered the service of an unnamed lord, who employed a troop of "players." Kyd was probably the private secretary of this nobleman, in whom Professor Boas sees Robert Radcliffe, afterwards fifth earl of Sussex. To the wife of the earl (Bridget Morison of Cassiobury) Kyd dedicated in the last year of his life his translation of Garnier's *Cornelia* (1594), the only work to which Kyd attached his name. Two prose works of the dramatist have survived, a treatise on domestic economy, *The Householder's Philosophy*, 1588; and a sensational

account of *The most wicked and secret Murdering of John Brewer, Goldsmith, 1592*. That many of Kyd's plays and poems have been lost is proved by the fact that fragments exist, attributed to him, which are found in no surviving context. Towards the close of his life Kyd was brought into relations with Marlowe which place his character in rather a painful light. It would seem that in 1590, soon after he entered the service of his nobleman, Kyd formed the acquaintance of Marlowe. If the former is to be believed, he shrank at once from the latter, as a man "intemperate and of a cruel heart," and "irreligious." This, however, was said by Kyd with the rope round his neck, and is scarcely consistent with a good deal of apparent intimacy between him and Marlowe. When, in May 1593, the "lewd libels" and "blasphemies" of Marlowe came before the notice of the Star Chamber, Kyd was immediately arrested, papers of his having been found "shuffled" with some of Marlowe's, who was imprisoned a week later. The pretence on which Kyd was arrested was the suspicion of his having attached a seditious libel to the wall of the Dutch churchyard. Kyd was put to the torture, but nothing was obtained from him in the way of confession. The most serious point made against him was the discovery in his chamber of a paper of "vile heretical conceits denying the deity of Jesus Christ." Kyd, in an agony of apprehension, asserted that he knew nothing of this document, and tried to shift the responsibility of it upon Marlowe, but he was kept in prison until after the death of that poet (1st June 1593). When he was at length dismissed, his patron refused to take him back into his service. The poet fell into utter destitution, and sank under the weight of "bitter times and privy broken passions." He must have died late in 1594, and on the 30th of December of that year his parents renounced their administration of the goods of their deceased son, in a document of great importance lately discovered by Professor Schick. This posthumous repudiation of the tortured and beggared poet by his respectable parents is the last touch needed to complete the gloomy portrait of Kyd which recent scholarship has filled up.

The importance of Kyd, as the pioneer in the wonderful movement of secular drama in England, gives great interest to his works, and we are now able at last to assert what many critics have long conjectured, that he takes in that movement the position of a leader and almost of an inventor. Regarded from this point of view, *The Spanish Tragedy* is a work of extraordinary value, since it is the earliest specimen of effective stage poetry existing in English literature. It had been preceded only by the pageant-poems of Peele and Lyly, in which all that constitutes in the modern sense theatrical technique and effective construction was entirely absent. These gifts, in which the whole power of the theatre as a place of general entertainment was to consist, were supplied earliest among English playwrights to Kyd, and were first exercised by him, so far as we can see, in 1586. This, then, is a more or less definite starting-date for Elizabethan drama, and of peculiar value to its historians. Curiously enough, *The Spanish Tragedy*, which was the earliest stage-play of the great period, was also the most popular, and held its own right through the careers of Shakespeare, Ben Jonson, and Fletcher. It was not any shortcoming in its harrowing and exciting plot, but the tameness of its archaic versification, which probably led in 1602 to its receiving "additions," which have been a great stumbling-block to the critics. It is known that Ben Jonson was paid for these additional scenes, but they are extremely unlike all other known writings of his, and several scholars have independently conjectured that Webster wrote them. Of Kyd himself it seems

needful to point out that neither the Germans nor even Professor Boas seems to realize how little definite merit his poetry has. He is important, not in himself, but as a pioneer. The influence of Kyd is marked on all the immediate predecessors of Shakespeare, and the bold way in which scenes of violent crime were treated on the Elizabethan stage appears to be directly owing to the example of Kyd's innovating genius. His relation to *Hamlet* has already been noted, and *Titus Andronicus* presents and exaggerates so many of his characteristics that Mr Sidney Lee and others have supposed that tragedy to be a work of Kyd's touched up by Shakespeare. Professor Boas, however, brings cogent objections against this theory, founding them on what he considers the imitative inferiority of *Titus Andronicus* to *The Spanish Tragedy*. The German critics have pushed too far their attempt to find indications of Kyd's influence on later plays of Shakespeare. The extraordinary interest felt for Kyd in Germany is explained by the fact that *The Spanish Tragedy* was long the best known of all Elizabethan plays abroad. It was acted at Frankfurt in 1601, and published soon afterwards at Nuremberg. It continued to be a stock piece in Germany until the beginning of the 18th century; it was equally popular in Holland, and potent in its effect upon Dutch dramatic literature. Kyd's works were first collected and his life written by Professor Frederick S. Boas in 1901. The principal German authorities are Sarrazin (1892), Fischer (1893), Gassner (1894), Fleischer (1896), and Schick (1898). (E. G.)

Kyffhäuser, a double line of hills in Thuringia, Germany, of which the northern looks steeply down upon the valley of the Goldene Aue, and is crowned by a couple of ruined castles—Rothenburg (1440 feet) on the west, and Kyffhausen (1542 feet) on the east. The latter, built probably in the 10th century, was frequently the residence of the Hohenstaufen emperors, and was finally destroyed in the 16th century. It is surmounted by an imposing monument to the Emperor William I., 213 feet high, the equestrian statue of the emperor alone being 31 feet high. According to a popular and long-accepted legend, the Emperor Barbarossa (Frederick I.) sits asleep beside a marble table in the interior of the mountain, surrounded by his knights, awaiting the destined day when he shall awaken and lead the united peoples of Germany against the enemies of the empire, and so inaugurate an era of unexampled glory. But G. Vogt has advanced cogent reasons (see *Hist. Zeitschrift*, vol. xxvi. pp. 131–187) for believing that the real hero of the legend is the last of the great Hohenstaufen emperors, namely Frederick II., not Frederick I. Around him gradually crystallized the hopes of the German peoples, and to him they looked for help in the hour of their sorest need. But this is not the only legend of a slumbering future deliverer which lives on in Germany. Similar hopes cling to the memory of Charlemagne, sleeping in a hill near Paderborn; to that of Wedekind, in a hill in Westphalia; to Siegfried, in the hill of Geroldseck; and to Henry I., in a hill near Goslar. And the legend has its parallel amongst other peoples—*e.g.*, the English looked for the second coming of King Arthur, the Danes for that of Holger Danske, the Swedes for that of King Olaf, the Portuguese for that of Dom Sebastian, the ancient Persians for that of Rustam, and so forth.

Kyô sai, Sho-fu (1831–1889), Japanese painter, was born at Koga in the province of Shimotsuke, Japan, in 1831. After working for a short time, as a boy, with Kuniyoshi, he received his artistic training in the studio of Kanô Dôhaku, but soon abandoned the formal traditions of his master for the greater freedom of the popular school. During the political ferment which produced and followed

the revolution of 1867, Kyōsai attained a considerable reputation as a caricaturist. He was three times arrested and imprisoned by the authorities of the Shogunate. Soon after the assumption of effective power by the Mikado, a great congress of painters and men of letters was held, at which Kyōsai was present. He again expressed his opinion of the new movement in a caricature, which had a great popular success, but also brought him into the hands of the police, this time of the opposite party. Kyōsai must be considered as the greatest successor of Hokusai (of whom, however, he was not a pupil), and as the first political caricaturist of Japan. His work—like his life—is somewhat wild and undisciplined, and “occasionally smacks of the *saké* cup.” But if he did not possess Hokusai’s dignity, power, and reticence, he substituted an exuberant fancy, which always lends interest to draughtsmanship of very great technical excellence. In addition to his caricatures, Kyōsai painted a large number of pictures and sketches, often choosing subjects from the folk-lore of his country. A fine collection of these works is preserved in the British Museum; and there are also good examples in the National Art Library at South Kensington, and the Musée Guimet at Paris. Among his illustrated books

may be mentioned *Yehon Taka-kagami*, Illustrations of Hawks (5 vols. 1870, &c.); *Kyōsai Gwafu* (1880); *Kyōsai Dongwa*; *Kyōsai Rakugwa*; *Kyōsai Raku-gwa*; *Kyōsai Mangwa* (1881); *Kyōsai Suigwa* (1882); and *Kyōsai Gwaden* (1887). The latter is illustrated by him under the name of Kawanabe Tōyoku, and two of its four volumes are devoted to an account of his own art and life. He died in 1889, at the age of fifty-eight.

Kyshtym, a town and iron-works of Russia, government of Perm, and 56 miles by rail east of Tchelyabinsk, on the Siberian main line, and on a river of the same name which connects two lakes. The official name is Upper (Verkhne) Kyshtymskiy Zavod, in order to distinguish it from the Lower (Nizhne K.) works, situated 2 miles lower down the same river. Nearly 26,000 tons of iron and iron goods are turned out yearly at these two works, which employ more than 2500 workers. Population, 12,331.

Labiche, Eugène Marie (1815–1888), French dramatist, was born in Paris on 5th May 1815, of *bourgeois* parentage. On leaving school he began reading for the bar, but literature had more powerful attractions, and he was hardly twenty years old when he gave to the *Chérubin*—an impertinent little magazine, long vanished and forgotten—a short story, entitled, in the cavalier style of the period, *Les plus belles sont les plus fausses*. A few others followed much in the same strain, but failed to catch the attention of the public. Labiche, as far as we are able to conjecture from his private correspondence, was much impressed by the great works of the flourishing romantic school. Very little trace, however, of its influence can be found in his first literary attempts. He tried his hand at dramatic criticism in the *Revue des Théâtres*, and in 1838 made a double venture on the stage. The small Théâtre du Panthéon produced, amid some signs of popular favour, a drama of his, *L’avocat Loubet*, while a vaudeville, *Coyllin ou l’homme infiniment poli*, written in collaboration with Marc Michel, and given at the Palais Royal, introduced for the first time to the Parisians a provincial actor who was to become and to remain a great favourite with them, Grassot, the famous low comedian. In the following year Labiche, still doubtful about his true vocation, published a romance called *La Clé des Champs*. M. Halévy, his successor at the Academy and his panegyrist, informs us that the publisher became a bankrupt soon after the novel was out. “A lucky misadventure, for,” the biographer concludes, “this timely warning of Destiny sent him back to the stage, where a career of success was awaiting him.” There was yet another obstacle in the way. When he married, he solemnly promised to his wife’s parents that he would renounce once for all a profession then considered incompatible with moral regularity and domestic happiness. But a year afterwards his wife spontaneously released him from his vow, and Labiche many years afterwards recalled the incident when he dedicated the first edition of his complete works—“To my wife.” Labiche, in conjunction with Varin, Marc Michel, Clairville, and Dumanoir, contributed comic plays interspersed with couplets to various Paris theatres. The series culminated in the memorable farce in five acts, *Un chapeau de paille d’Italie*

(August 1851). It remains to this day an accomplished specimen of the French *imbroglio* in which some one is in search of something, but does not find it till five minutes before the curtain falls. Prior to that date Labiche had been only a successful *vaudevilliste* among a crowd of others; but a twelvemonth later he made a new departure in *Le Misanthrope et l’Auvergnat*. All the plays given for the next twenty-five years, although constructed on the old plan, contained a more or less appreciable dose of that comic observation and good sense which gradually raised the French farce almost to the level of the comedy of character and manners. “Of all the subjects,” he said, “which offered themselves to me, I have selected the *bourgeois*. Essentially mediocre in his vices and in his virtues, he stands half-way between the hero and the scoundrel, between the saint and the profligate.” During the second period of his career Labiche had the collaboration of Delacour, Choler, and a few others. When it is asked what share in the authorship and success of the plays may be claimed for those men, we shall answer in Émile Augier’s words: “The distinctive qualities which secured a lasting vogue for the plays of Labiche are to be found in all the comedies written by him with different collaborators, and are conspicuously absent from those which they wrote without him.” All that is known of his literary methods leads to the same conclusion, namely, that he was both the leading spirit and the working hand in the combined effort. A more useful and more important collaborator he found in Geoffroy, whom he had known as a *débutant* in his younger days, and who remained his faithful interpreter to the last. Geoffroy impersonated the *bourgeois* not only to the public, but to the author himself; and it may be assumed that Labiche, when writing, could see and hear Geoffroy acting the character and uttering, in his pompous, fussy way, the words that he had just committed to paper.

Célimaire le bien-aimé, *Le Voyage de Perrichon*, *La Grammaire*, *Un Pied dans le Crime*, *La Cagnotte*, may be quoted here as the happiest productions of Labiche. In 1877 he deliberately brought his connexion with the stage to a close, and retired to his rural property in Sologne. There he could be seen every day, dressed as a farmer,

THE CALLIGRAPHER ONO-NO-TÔFŪ WATCHING THE PERSEVERANCE OF THE FROGS (a similar story to that of Bruce and the Spider). Painted by KYÔSAI.

with low-brimmed hat, thick gaiters, and an enormous stick, superintending the agricultural work and busily engaged in reclaiming land and marshes. His lifelong friend, Augier, visited him in his principality, and, being left alone one day in the library, took to reading his host's dramatic productions, scattered here and there in the shape of theatrical *brochures*. The result was that he strongly advised Labiche to publish a collected and revised edition of his works. The suggestion, first declined as a joke and long resisted, was finally accepted and carried into effect. Labiche's comic plays, in ten volumes, were issued, by successive instalments, during 1878 and 1879. The success was even greater than had been expected by the author's most sanguine friends. It had been commonly admitted that these plays owed their popularity in a great measure to the favourite actors who had appeared in them; but it was now discovered that, on the contrary, all, with the exception of Geoffroy, had introduced into them a grotesque and caricatural element, thus hiding from the spectator, in many cases, the true comic vein and delightful delineation of human character. The amazement turned into admiration, and the *engouement* became so general that very few dared grumble or appear scandalized when, in 1880, Labiche was elected to

the French Academy. It was fortunate that, in former years, he had never dreamt of attaining this high distinction; for, as M. Pailleron justly observed, while trying to get rid of the little faults which were in him, he would have been in danger of losing some of his sterling qualities. But when the honour was bestowed upon him, he enjoyed it with his usual good sense and quiet modesty. He died in Paris on 23rd January 1888.

Some foolish admirers have placed him on a par with Molière, but it will be enough to say that he was something better than a public *amuseur*. Many of his plays have been transferred to the English stage. They are, on the whole, as sound as they are entertaining. Love is practically absent from his theatre. In none of his plays did he ever venture into the depths of feminine psychology, and womankind is only represented in them by pretentious old maids and silly, insipid, almost dumb, young ladies. He ridiculed marriage according to the invariable custom of French playwrights, but in a friendly and good-natured manner which always left a door open to repentance and timely amendment. He is never coarse, never suggestive. After he died, the French farce, which he had raised to something akin to literature, relapsed into its former grossness and unmeaning complexity. (A. FI.)

LABOUR LEGISLATION.

I. UNITED KINGDOM.

Factories and Workshops.—Since 1878 most important developments of legislation for the protection of labour in industry have been made in the division of the law which relates particularly to factories and workshops. The Act of 1878 remained until 1901, although much had been meanwhile superimposed, a monument to the efforts of the great factory reformers of the first half of the 19th century, and the general groundwork of safety for workers in factories and workshops in the main divisions of sanitation, security against accidents, physical fitness of workers, general limitation of hours and times of employment for young workers and women. The Act of 1901, which came into force 1st January 1902, was an amending as well as a consolidating Act. Comparison of the two Acts shows, however, that, in spite of the advantages of further consolidation and helpful changes in arrangement of sections and important additions which tend towards a specialized hygiene for factory life, the fundamental features of the law as fought out in the 19th century remain untouched. So far as the law has altered in character, it has done so by gradual development of certain sanitary features, originally subordinate, and not by retreat from its earlier aims.

The precise effect of the new law as a whole, with its considerable amendments, has in working yet to be tested, but its general intention can be made clear by reference to the Acts and decisions which it embodies.

The Act of 1878, in a series of Acts from 1883 to 1895, received striking additions, based (1) on the experience gained in other branches of protective legislation, *e.g.*, development of the method of regulation by "special rules" and administrative inquiry into accidents under Coal Mines Acts; (2) on the findings of royal commissions and parliamentary inquiries, *e.g.*, increased control of "outwork" and domestic workshops, and limitation of "overtime"; (3) on the development of administrative machinery for enforcing the more modern law relating to public health, *e.g.*, transference of administration of sanitary provisions in workshops to the local sanitary authorities; (4) on the

trade union demand for means for securing trustworthy records of wage-contracts between employer and workman, *e.g.*, the section requiring particulars of work and wages for piece-workers. The first additions to the Act of 1878 were, however, almost purely attempts to deal more adequately than had been attempted in the code of 1878 with striking instances of trades injurious to health, without any suggestion of a groundwork for future regulation of other injurious or dangerous trades. Thus the Factory and Workshop Act of 1883 provided that white-lead factories should not be carried on without a certificate of conformity with certain conditions, and also made provision for special rules, on lines superseded by those laid down in the Act of 1891, applicable to any employment in a factory or workshop certified as dangerous or injurious by the Secretary of State. The Act of 1883 also dealt with sanitary conditions in bakehouses, a class of workplaces liable to be a menace to public health as well as injurious to workers if the strictest hygienic conditions are not fully observed. Certain definitions and explanations of previous enactments touching overtime and employment of a child in any factory or workshop were also included in the Act of 1883. A class of factories in which excessive heat and humidity seriously affected the health of operatives was next dealt with in the Cotton Cloth Factories Act, 1889. This provided for special notice to the Chief Inspector from all occupiers of cotton cloth factories (*i.e.*, any room, shed, or workshop, or part thereof, in which weaving of cotton cloth is carried on) who intend to produce humidity by artificial means; regulated both temperature of workrooms and amount of moisture in the atmosphere, and provided for tests and records of the same; and fixed a standard minimum volume of fresh air (600 cubic feet) to be admitted in every hour for every person employed in the factory. Power was retained for the Secretary of State to modify by order the standard for the maximum limit of humidity of the atmosphere at any given temperature. A short Act of two clauses in 1897 extended this power to other measures for the protection of health, recommended by a departmental committee appointed to inquire into the working of the Act of 1889.

**Additions
to Act of
1878.**

The special measures from 1878 to 1889 gave valuable precedents for further developments of special hygiene in factory life, but the next advance, in the Factory and Workshop Act, 1891, following as it did on the House of Lords Committee on the sweating system and the Berlin International Labour Conference, extended over much wider ground. Its principal objects were: (a) to render administration of the law relating to workshops more efficient, particularly as regards sanitation; with this end in view it made the primary controlling authority for sanitary matters in workshops the local sanitary authority (now known as the District Council), acting by their officers, and giving them for the purpose the powers of the less numerous body of factory inspectors, while at the same time the provisions of the Public Health Acts replaced in workshops the very similar sanitary provisions of the Factory Acts; (b) to provide for greater security against accidents and more efficient fencing of machinery in factories; (c) to extend the method of regulation of unhealthy or dangerous occupations by application of special rules and requirements to any incident of employment (other than in a domestic workshop) certified by the Secretary of State to be dangerous or injurious to health or dangerous to life or limb; (d) to raise the age of employment of children and restrict the employment of women immediately after childbirth; (e) to require particulars of rate of wages to be given with work to piece-workers in certain branches of the textile industries; (f) to amend the Act of 1878 in various subsidiary ways, with the view of improving the administration of its principles, *e.g.*, by increasing the means of checking the amount of overtime worked, empowering inspectors to enter workplaces used as dwellings without a justice's warrant, and the imposition of minimum penalties in certain cases. On this Act followed a period of four years of greatly accelerated administrative activity and application of the new powers to make detailed regulations for the promotion of special hygiene in unhealthy industries. No fewer than sixteen trades were in four years scheduled by the Secretary of State as dangerous to health. The manner of preparing and establishing suitable rules (greatly modified by the Act of 1901) will be dealt with below.

The Factory and Workshop Act, 1895, followed thus on a period of exercise of new powers of administrative regulation (the period being also that during which the Royal Commission on Labour made its wide survey of industrial conditions), and after two successive annual reports of the Chief Inspector of Factories had embodied reports and recommendations from the women inspectors, who in 1893 were first added to the inspectorate. Again, the chief features of an even wider legislative effort than that of 1891 were the increased stringency and definiteness of the measures for securing hygienic and safe conditions of work. Some of these measures, however, involved the introduction of new principles, as in the provision for the prohibition of the use of a dangerous machine or structure by the order of a magistrate's court, and the power to include in the special rules drawn up in pursuance of section 8 of the Act of 1891, the prohibition of the employment of any class of persons, or the limitation of the period of employment of any class of persons in any process scheduled by order of the Secretary of State. These last two powers have both been exercised, and with the exercise of the latter passed away, without opposition, the absolute freedom of the employer of the adult male labourer to carry on his manufacture without legislative limitation of the hours of labour. Second only in significance to these new developments was the addition, for the first time since 1867, of new classes of workplaces not covered by the general definitions in section 93 of the

Consolidating Act of 1878, *viz.*: (a) laundries (with special conditions as to hours, &c.); (b) docks, wharves, quays, warehouses, and premises on which machinery worked by power is temporarily used for the purpose of the construction of a building or any structural work in connexion with the building (for the purpose only of obtaining security against accidents). Other entirely new provisions in the Act of 1895, later strengthened by the Act of 1901, were the requirement of a reasonable temperature in workrooms, the requirement of lavatories for the use of persons employed in any department where poisonous substances are used, the obligation on occupiers and medical practitioners to report cases of industrial poisoning; and the penalties imposed on an employer wilfully allowing wearing apparel to be made, cleaned, or repaired in a dwelling-house where an inmate is suffering from infectious disease. Another provision was new, which aimed at empowering the Secretary of State to specify classes of outwork and areas with a view to the regulation of the sanitary condition of premises in which outworkers are employed. Owing, however, to the conditions attached to its exercise, no case was found in which this power could come into operation, and the Act of 1901 deals with the matter on new lines. The requirement of annual returns from occupiers of persons employed, and the competency of the person charged with infringing the Act to give evidence in his defence, were two important new provisions calling for notice, as also the adoption of the powers to direct a formal investigation of any accident on the lines laid down in section 45 of the Coal Mines Regulation Act, 1887. Other sections, relating to sanitation and safety, were developments of previous regulations rather than fresh departures, *e.g.*, the fixing of a standard of overcrowding, provision of sanitary accommodation separate for each sex where the standard of the Public Health Act Amendment Act of 1890 had not been adopted, power to order a fan or other mechanical means to carry off injurious gas, vapour, or other impurity (the previous power covering only dust). Under the head of safety, the fencing of machinery and definition of accidents were made more precise, young persons were prohibited from cleaning dangerous machinery, and additional safeguards against risk of injury by fire or panic were introduced. On the question of employment the two foremost amendments lay in the almost complete prohibition of overtime for young persons, and the restriction of the power of an employer to employ protected persons outside his factory or workshop on the same day that he had employed them in the factory or workshop. Under the head of particulars of work and wages to piece-workers an important and new power, highly valued by the workers, was given to apply the principle with the necessary modifications by order of the Secretary of State to industries other than textile.

In 1899 an indirect modification of the limitation to employment of children was effected by the Elementary Education Amendment Act, which, by raising from eleven to twelve years the minimum age at which a child may, by the bye-laws of a local authority, obtain a total or partial exemption from the obligation to attend school, made it unlawful for an occupier to take into employment any child under twelve years in such a manner as to prevent full-time attendance at school. The age of employment became generally thereby the same as it has been for employment at a mine above ground since 1887. The Act of 1901 makes the prohibition of employment of a child under twelve years of age in a factory or workshop direct and absolute. Under the divisions of sanitation, safety, fitness for employment, special regulation of dangerous trades, special control of bake-

*The Act
of 1901.*

houses, exceptional treatment of creameries, new methods of dealing with home work and outworkers, important additions have been made to the general law by the Act of 1901, as also in various regulations for strengthened administrative control. New general sanitary provisions are those prescribing: (a) ventilation *per se* for every workroom, and empowering the Secretary of State to fix a standard of sufficient ventilation; (b) drainage of wet floors; (c) the power of the Secretary of State to define in certain cases what shall constitute sufficient and suitable sanitary accommodation. New safety provisions are those relating to—(a) Examination and report on steam boilers; (b) prohibition of employment of a child in cleaning below machinery in motion; (c) power of the District Council to make bye-laws for escape in case of fire. The most important administrative alterations are the following: (a) A justice engaged in the same trade as, or being officer of an association of persons engaged in the same trade as, a person charged with an offence may not act at the hearing and determination of the charge; (b) ordinary supervision of sanitary conditions under which outwork is carried on is transferred to the District Council, full power being reserved to the Home Office to intervene in case of neglect or default by any District Council.

The following paragraphs aim at presenting an idea of the scope of the modified and amended law, as a whole, adding where clearly necessary reference to the effect of the Acts of 1878 to 1889, which ceased to apply after 31st December 1901:—

The workplaces to which the Act applies are, first, "factories" and "workshops"; secondly, laundries, docks, wharves, &c., enumerated above as introduced and regulated partially only by the Act of 1895. Apart from this secondary list, and having regard to workplaces which remain undefined by the law, the Act may broadly be said to apply to premises, rooms, or places in which manual labour, with or without the aid of mechanical power, is exercised for gain in or incidental to the making, altering, repairing, ornamenting, or finishing or adapting for sale of any article or part of any article. If steam, water, or other mechanical power is used in aid of the manufacturing process, the workplace is a factory; if not, it is a workshop. There is, however, a list of eighteen classes of works (brought under the factory law for reasons of safety, &c., before workshops generally were regulated) which are defined as factories whether power is used in them or not. Factories are, again, subdivided into textile and non-textile: they are textile if the machinery is employed in preparing, manufacturing, or finishing cotton, wool, hair, silk, flax, hemp, jute, tow, China grass, cocoon fibre, or other like material either separately or mixed together, or mixed with any other material, or any fabric made thereof; all other factories are non-textile. The distinction turns on the historical origin of factory regulation, the earliest places calling for regulation having been the textile factories, and the regulations remain in some respects slightly more stringent than in the non-textile factories and workshops, though the general provisions are almost the same. Three special classes of workshops have for certain purposes to be distinguished from ordinary workshops, which include tenement workshops: (a) Domestic workshops, *i.e.*, any private house, room, or place, which, though used as a dwelling, is by reason of the work carried on there a workshop, and in which the only persons employed are members of the same family, dwelling there alone—in these women's hours are unrestricted; (b) Women's workshops, in which neither children nor young persons are employed—in these a more elastic arrangement of hours is permissible than in ordinary workshops; (c) Workshops in which men only are employed—these come under the same general regulations in regard to sanitation as other workshops, also under the provisions of the Factory Act as regards security, and, if certified by the Secretary of State, may be brought under special regulations. They are otherwise outside the scope of the Act of 1901.

The persons to whom the regulations apply in the above-defined workplaces are *children*, *i.e.*, persons between the ages of twelve and fourteen, *young persons*, *i.e.*, boys or girls between the ages of fourteen (or if an educational certificate has been obtained, thirteen) and eighteen years of age, and *women*, *i.e.*, female persons above the age of eighteen; these are all "protected" persons to whom the general provisions of the Act, inclusive of the regulation of hours and times of employment, apply. To adult men generally those provisions broadly only apply which are aimed at

securing sanitation and safety in the conduct of the manufacturing process.

The person generally responsible for observance of the provisions of the law, whether these relate to health, safety, limitation of the hours of labour, or other matters, is the *occupier* (a term undefined in the Act) of the factory, workshop, or laundry. There are, however, limits to his responsibility: (a) generally, where the occupier has used due diligence to enforce the execution of the Act, and can show that another person, whether agent, servant, workman, or other person, is the real offender; (b) specially in a factory the sections relating to employment of protected persons, where the owner or hirer of a machine or implement driven by mechanical power is some person other than the occupier of the factory, the owner or hirer, so far as respects any offence against the Act committed in relation to a person who is employed in connexion with the machine or implement, and is in the employment or pay of the owner or hirer, shall be deemed to be the occupier of the factory; (c) for the one purpose of reporting accidents, the actual employer of the person injured in any factory or workshop is bound under penalty immediately to report the same to the occupier; (d) so far as relates to sanitary conditions, fencing of machinery, affixing of notices in *tenement* factories, the *owner* (as defined by the Public Health Act, 1875), generally speaking, takes the place of the occupier.

Employment in a factory or workshop includes work whether for wages or not: (a) in a manufacturing process or handicraft, (b) in cleaning any place used for the same, (c) in cleaning or oiling any part of the machinery, (d) any work whatsoever incidental to the process or handicraft, or connected with the article made. Persons found in any part of the factory or workshop, where machinery is used or manufacture carried on, except at meal-times, or when machinery is stopped, are deemed to be employed until the contrary is proved. The Act, however, does not apply to employment for the sole purpose of repairing the premises or machinery, nor to the process of preserving and curing fish immediately upon its arrival in the fishing boats in order to prevent the fish from being destroyed or spoiled, nor to the process of cleaning and preparing fruit so far as is necessary to prevent it from spoiling during the months of June, July, August, and September. Certain light handicrafts carried on by a family only in a private house or room at irregular intervals are also outside the scope of the Act.

The foremost provisions are those relating to the sanitary condition of the workplaces and the general security of every class of worker. Every factory must be kept in a cleanly condition, free from noxious effluvia, ventilated in such a manner as to render harmless, so far as practicable, gases, vapours, dust, or other impurities generated in the manufacture; must be provided with sufficient and suitable sanitary conveniences separate for the sexes; must not be overcrowded (not less than 250 cubic feet during the day, 400 during overtime, for each worker). In these matters the law of public health takes in workshops the place of the Factory Act, the requirements being substantially the same. Although, however, primarily the officers of the District Council enforce the sanitary provisions in workshops, the Government factory inspectors may give notice of any defect in them to the District Council in whose district they are situate; and if proceedings are not taken within one month by the latter, the factory inspector may act in default and recover expenses from the District Council. This power does not extend to domestic workshops which are under the law relating to public health so far as general sanitation is concerned. General powers are reserved to the Secretary of State, where he is satisfied that the Factory Act or law relating to public health as regards workplaces has not been carried out by any District Council, to authorize an inspector during a period named in his order to act instead of the District Council. Other general sanitary provisions administered by the Government inspectors are the requirement in factories and workshops of washing conveniences where poisonous substances are used; adequate measures for securing and maintaining a reasonable temperature of such a kind as will not interfere with the purity of the air in each room in which any person is employed; maintenance of sufficient means of ventilation in every room in a factory or workshop (in conformity with such standard as may be prescribed by order of the Secretary of State); provision of a fan to carry off injurious dust, gas, or other impurity, and prevent their inhalation in any factory or workshop; drainage of floors where wet processes are carried on. For laundries and bakehouses there are further sanitary regulations; *e.g.*, in laundries all stoves for heating irons shall be sufficiently separated from any ironing room, and the floors shall be "drained in such a manner as will allow the water to flow off freely"; and in bakehouses a system supplying water to a bakehouse must be quite separate from that supplying water to a water-closet, and the latter may not communicate directly with the bakehouse. Use of underground bakehouses (*i.e.*, a baking room with floor more than three feet below the ground adjoining) is prohibited, except where already used at the passing of the Act; further, in these cases, after 1st January 1904, a certificate as to

suitability in light, ventilation, &c., must be obtained from the District Council. In other trades certified by the Secretary of State further sanitary regulations may be made to increase security for health by special rules to be presently touched on. The Secretary of State may also make sanitary requirements a condition of granting such exceptions to the general law as he is empowered in some cases to grant. In factories, as distinct from workshops, a periodical lime washing (or washing with hot water and soap where paint and varnish have been used) of all inside walls and ceilings once at least in every fourteen months is required (in bakehouses once in six months). As regards sufficiency and suitability of sanitary accommodation, any standard determined by order of the Secretary of State shall be observed in the districts to which it is made applicable.

Security in the use of machinery is provided for by precautions as regards the cleaning of machinery in motion and working between the fixed and traversing parts of self-acting machines driven by power, by fencing of machinery, and by empowering inspectors to obtain an order from a court of summary jurisdiction to prohibit the use,

Security and accidents.

temporarily or absolutely, of machinery, ways, works or plant, including use of a steam boiler, which cannot be used without danger to life and limb. Every hoist and fly-wheel directly connected with mechanical power, and every part of a water-wheel or engine worked by mechanical power, and every wheel race, must be fenced, whatever its position, and every part of mill-gearing or dangerous machinery must either be fenced or be in such position that it is as safe as if fenced. No protected persons may clean any part of mill-gearing in motion, and children may further not clean any part of or below manufacturing machinery in motion by aid of mechanical power; young persons further may not clean any machinery if the inspector notifies it to the occupier as dangerous. Security as regards the use of dangerous premises is provided for by empowering courts of summary jurisdiction, on the application of an inspector, to prohibit their use until the danger has been removed. The District Council or, in London, the County Council, or in case of their default the factory inspector, can require certain provisions for escape in case of fire in factories and workshops, and for this purpose have special powers to make bye-laws. The means of escape must be kept free from obstruction. Certain provisions are also made for doors to open outwards in each room in which more than ten persons are employed, and to prevent the locking, bolting, or fastening of doors so that they cannot easily be opened from inside when any person is employed or at meals inside the workplace. Further, provisions for security may be provided in special regulations. Every boiler for generating steam in a factory or workshop or place where the Act applies must have a proper safety valve, a steam gauge, and a water gauge, and every such boiler, valve, and gauge must be maintained in proper condition. Examination by a competent person must take place at least once in every fourteen months. The occupier of any factory or workshop may be liable for penal compensation not exceeding £100 in case of injury or death due to neglect of any provision or special rule, the whole or any part of which may be applied for the benefit of the injured person or his family, as the Secretary of State determines. When a death has occurred by accident in a factory or workshop, the coroner must advise the Government inspector for the district of the place and time of the inquest. The Secretary of State may order a formal investigation of the circumstances of any accident, as in the case of mines (§§ 45 and 46 of the Act of 1887). Careful and detailed provisions are made for the reporting by occupiers to inspectors (and in some cases to certifying surgeons also) and entry in the registers at factories and workshops of accidents entailing absence from ordinary employment, and of cases of lead, phosphorus, arsenical and mercurial poisoning, or anthrax. The duty of reporting these industrial cases of poisoning is also laid on medical practitioners under whose observation they come. The list of classes of poisoning can be extended by the Secretary of State's order.

Certificates of physical fitness for employment must be obtained by the occupier from the certifying surgeon for the district for all persons under sixteen years of age employed in a factory, and an inspector may suspend any such persons for re-examination in a factory, or for examination in a workshop, when "disease or bodily infirmity" unfits the person, in his opinion, for the work of the place. An occupier of a factory or workshop or laundry shall not knowingly allow a woman to be employed therein within four weeks after childbirth.

The employment of children, young persons, and women is regulated as regards ordinary and exceptional hours of work, ordinary and exceptional meal-times, length of spells, and holidays. The outside limits of ordinary periods of employment and holidays are broadly the same for textile factories as for non-textile factories and workshops; the main difference lies in the requirement of not less than a total two hours' interval for meals out of the twelve, and a limit of four and a half hours for any spell of work, a longer weekly half holiday, and a prohibition of overtime, in textile factories, as compared with a

total one and a half hours' interval for meals and a limit of five hours for spells and (conditional) permission of overtime in non-textile factories. The hours of work in all these cases must be specified, and from Monday to Friday may be between 6 A.M. and 6 P.M., or 7 A.M. to 7 P.M.; in non-textile factories and workshops the hours also may be taken between 8 A.M. and 8 P.M., or by order of the Secretary of State for special industries 9 A.M. to 9 P.M. Between these outside limits, with the proviso that meal-times must be fixed and limits as to spells observed, women and young persons may be employed the full time, children on the contrary only half time, on alternate days, or in alternate sets attending school half time regularly. On Saturdays, in textile factories in which the period commences at 6 A.M. all manufacturing work must cease at 12 if not less than one hour is given for meals, or 11.30 if less than one hour is given for meals (half an hour extra allowed for cleaning), and in non-textile factories and workshops at 2 P.M., 3 P.M., or 4 P.M., according as the hour of beginning is 6 A.M., 7 A.M., or 8 A.M. In "domestic workshops" the total number of hours for young persons and children must not exceed those allowed in ordinary workshops, but the outside limits for beginning and ending are wider; and the case is similar as regards hours of women in "women's workshops." Employment outside a factory or workshop in the business of the same is limited in a manner similar to that laid down in the Shop Hours Act, to be touched on presently. Overtime in certain classes of factories, workshops, and warehouses attached to them is permitted, under conditions specified in the Acts, for women, to meet seasonal or unforeseen pressure of business, or where goods of a perishable nature are dealt with, for young persons only in a very limited degree in factories liable to stoppage for drought or flood, or for an unfinished process. These and other cases of exceptional working are under minute and careful administrative regulations. Broadly these same regulations as to exceptional overtime apply in laundries, but the ordinary regulation of the period of employment does not; in them the period may be daily changed by the occupier, and the main general limit is to sixty hours a week for women and young persons, and thirty hours a week for children; the only regulation with regard to meal-times is that protected persons may not be employed for more than five hours without being allowed at least half an hour for a meal. Night work is allowed in certain specified industries under conditions for male young persons, but for no other workers under eighteen, and overtime for women may never, except in laundries, be later than 10 P.M. or before 6 A.M. Sunday work is prohibited except in laundries; and in factories, workshops, and laundries six holidays (generally the Bank holidays) must be allowed in the year. In creameries in which women and young persons are employed the Secretary of State may by special order vary the beginning and end of the daily period of employment, and allow employment for not more than three hours on Sundays and holidays.

The general provisions of the Act may be supplemented where specially dangerous or unhealthy trades are carried on, by special regulations to meet the necessities of the case. This was provided for in the law in force until 31st December 1901, as in the new Act, and the power to establish rules had been exercised between 1892 and 1901 in the case of twenty-two trades or processes where injury arose either from handling of dangerous substances, such as lead and lead compounds, phosphorus, arsenic, or various chemicals, or where there is inhalation of irritant dust or noxious fumes, or where there is danger of explosion or infection of anthrax. Before the rule could be drawn up under the Acts of 1891 to 1895, the Secretary of State had to certify that in the particular case or class of cases in question (*e.g.*, process or machinery), there was, in his opinion, danger to life or limb or risk of injury to health; thereupon the Chief Inspector might propose to the occupier of the factory or workshop such special rules or measures as he thought necessary to meet the circumstances. The occupier might object or propose modifications, but if he did not the rules became binding in twenty-one days; if he objected, and the Secretary of State did not assent to any proposed modification, the matters in difference had to be referred to arbitration, the award in which finally settled the rules or requirement to be observed. In November 1901, in the case of the earthenware and china industry, the last arbitration of the kind was opened and partly concluded; certain points of difference were by the umpire adjourned for further consideration until May 1903. These points touch: (a) the nature or form of the poisonous material used; (b) medical examination and suspension of male adult workers. The parties to the arbitration were the Chief Inspector, on behalf of the Secretary of State, on the one hand, and the occupier or occupiers, on the other hand, but the workmen interested might be represented on the arbitration. In the establishing of the twenty-two sets of existing special rules only thrice has arbitration been resorted to, and only on two of these occasions were workmen represented. The provisions as to the arbitration were laid down in the first schedule to the Act of 1891, and were

Dangerous and unhealthy industries.

similar to those under the Coal Mines Regulation Acts. After rules were established the Secretary of State might from time to time propose new rules, or amendments of established rules, and the procedure was to be as nearly as possible the same as in the first instance. The rules might not only regulate conditions of employment, but also restrict or prohibit employment of any class of workers; where such restriction or prohibition affected adult workers the rules must be laid for forty days before both Houses of Parliament before coming into operation. The obligation to observe the rules in detail lies on workers as well as on occupiers, and the section in the Act of 1891 providing a penalty for non-observance was drafted, as in the case of the mines, so as to provide for a simultaneous fine for each (not exceeding two pounds for the worker, not exceeding ten pounds for the employer).

The provisions as to special regulations of the Act of 1901 touch primarily the method of procedure for making the regulations, but they also cover for the first time domestic workshops and add a power as to the kind of regulations that may be made; further, they strengthen the sanction for observance of any rules that may be established, by placing the occupier in the same general position as regards penalty for non-observance as in other matters under the Act. On the certificate of the Secretary of State that any manufacture, machinery, plant, process, or manual labour used in factories or workshops is dangerous or injurious to life, health, or limb, such regulations as appear to the Secretary of State to meet the necessity of the case may be made by him after he has duly published notice: (1) of his intention; (2) of the place where copies of the draft regulations can be obtained; and (3) of the time during which objections to them can be made by persons affected. The Secretary of State may modify the regulations to meet the objections made. If not, unless the objection is withdrawn or appears to him frivolous, he shall, before making the regulations, appoint a competent person to hold a public inquiry with regard to the draft regulations and to report to him thereon. The inquiry is to be made under such rules as the Secretary of State may lay down, and when the regulations are made, they must be laid as soon as possible before Parliament. Either House may annul these regulations or any of them, without prejudice to the power of the Secretary of State to make new regulations. The regulations may apply to all factories or workshops in which the certified manufacture, process, &c., is used, or to a specified class. They may, among other things, (a) prohibit or limit employment of any person or class of persons; (b) prohibit, limit, or control use of any material or process; (c) modify or extend special regulations contained in the Act.

Although the Factory and Workshop Acts have not in any way directly regulated wages, they have made certain provision for securing to the worker that the amount agreed upon shall be received by him or her: (a) by extending every Act in force relating to the inspection of weights, measures, and weighing-machines for use in the sale of goods to those used in a factory or workshop for checking or ascertaining the wages of persons employed; (b) by ensuring that piece-workers in the textile trades (and other trades specified by the Secretary of State) shall receive, before commencing any piece of work, clear particulars of the wages applicable to the work to be done and of the work to which that rate is to be applied. Unless the particulars of work are ascertainable by an automatic indicator, they must be given to textile workers in writing, and in the case of weavers in the cotton, worsted, and woollen trades the particulars of wages must be supplied separately to each worker, and also shown on a placard in a conspicuous position. In other textile processes it is sufficient to furnish the particulars separately to each worker. The Secretary of State has used his powers to extend this protection to non-textile workers, with suitable modifications, in various branches of clothing and hardware industries. Under the new Act he further has power to extend this protection to outworkers.

With a view to efficient administration of the Act (a) certain notices have to be conspicuously exhibited at the factory or workshop, (b) registers and lists kept, and (c) notices sent to the inspector by the occupier. Among the first the most important are the prescribed abstract of the Act, the names and addresses of the inspector and certifying surgeon, the period of employment, and specified meal-times (which may not be changed without fresh notice to the inspector), the number of persons who may legally be employed in each room, and prescribed particulars of exceptional employment; among the second are the general registers of children and young persons employed, of accidents, of overtime, and lists of outworkers; among the third are the notice of beginning to occupy a factory or workshop, which the occupier must send within one month, report of overtime employment, notice of accident, poisoning, or anthrax, and returns of persons employed, with such other particulars as may be prescribed. These must be sent to the Chief Inspector at intervals of not less than one and not more than three years, as may be directed by the Secretary of State.

The Secretary of State for the Home Department controls the administration of the Acts, appoints the inspectors referred to in the Acts, assigns to them their duties, and regulates the manner and cases in which they are to exercise the powers of inspectors defined in the Act. The Act, however, expressly assigns certain duties and powers to a chief inspector and certain to district inspectors. Many of the provisions of the Acts depend as to their operation on the making of orders by the Secretary of State. These orders may impose special obligations on occupiers and increase the stringency of regulations, may apply exceptions as to employment, or may relax regulations to meet special classes of circumstances. In certain cases, already indicated, his orders guide or determine the action of district councils, and, generally, in case of default by a council he may empower his inspectors to act as regards workplaces instead of the council, both under the Factory Acts and the Public Health Acts.

The powers of an inspector are to enter, inspect, and examine, by day or by night, at any reasonable time, any factory or workshop (or laundry, dock, &c.), or part of one, when he has reason to believe that any person is employed there; to take with him a constable if he has reasonable cause to expect obstruction; to require production of registers, certificates, &c., under the Acts; to examine, alone or in the presence of any other person, as he sees fit, every person in the factory or workshop, or in a school where the children employed are being educated; to prosecute, conduct, or defend before a court of summary jurisdiction any proceeding under the Acts; and to exercise such other powers as are necessary for carrying the Act into effect. The inspector has also the duty of enforcing the Truck Acts in places, and in respect of persons, under the Factory Acts. He may also have assigned to him by the Secretary of State the duty of enforcing the restrictions and conditions of any license for the employment of a child in places of public entertainment under the Prevention of Cruelty to Children Act, 1894. Certifying surgeons are appointed by the Chief Inspector subject to the regulations of the Secretary of State, and their chief duties are to examine workers under sixteen, and persons under special rules, as to physical fitness, and to investigate and report on accidents and cases of lead, phosphorus, or other poisoning, and anthrax.

In 1900 there were registered as under inspection 95,664 factories and 137,648 workshops (inclusive of laundries), 2097 docks, wharves, and quays, and 3907 warehouses. Of notices of accidents received there were 79,020, of which 1045 were fatal, and of cases of poisoning by lead, 1058; by mercury, 9; by phosphorus, 3; by arsenic, 22; and of anthrax, 37. Notices by inspectors to local sanitary authorities numbered 4542. Proceedings were taken by inspectors in 3287, and convictions obtained in 3151 cases.

Coal Mines.—The mode of progress to be recorded in the regulation of coal mines since 1872 can be contrasted in one aspect with the progress just recorded of factory legislation since 1878. Consolidation was earlier adopted when large amendments were found necessary, with the result that by far the greater part of the law is to be found in the Act of 1887 (50 and 51 Vict. cap. 58), which repealed and re-enacted, with amendments, the Coal Mines Acts of 1872 and 1886, and the Stratified Ironstone Mines (Gunpowder) Act, 1881. The Act of 1881 was simply concerned with rules relating to the use of explosives underground. The Act of 1886 dealt with three questions: (a) The election and payment of checkweighers (*i.e.*, the persons appointed and paid by miners in pursuance of section 13 of the Act of 1887 for the purpose of taking a correct account on their behalf of the weight of the mineral gotten by them, and for the correct determination of certain deductions for which they may be liable); (b) provision for new powers of the Secretary of State to direct a formal investigation of any explosion or accident, and its causes and circumstances, a provision which was later adopted in the law relating to factories; (c) provision enabling any relatives of persons whose death may have been caused by explosions or accidents in or about mines to attend in person, or by agent, coroners' inquests thereon, and to examine witnesses. The Act of 1887, which amended, strengthened, and consolidated these Acts and the earlier Consolidating Act of 1872, may also be contrasted in another aspect with the general Acts of factory legislation. In scope it formed, as its principal forerunner had done, a general code; and in some measure it went farther in the way of consolidation than the Factory Acts had done, inasmuch

as certain questions, which in factories are dealt with by statutes distinct from the Factory Acts, have been included in the Mines Regulation Acts, *e.g.*, the prohibition of the payment of wages in public-houses, and the machinery relating to weights and measures whereby miners control their payment; further, partly from the less changing nature of the industry, but probably mainly from the power of expression gained for miners by their organization, the code, so far as it went, at each stage answered apparently on the whole more nearly to the views and needs of the persons protected than the parallel law relating to factories. This is strikingly seen in the evidence before the Royal Commission on Labour in 1892-94, where the repeated expressions of satisfaction on the part of the miners with the provisions as distinct from the administration of the code ("with a few trifling exceptions") are in marked contrast with the long and varied series of claims and contentions put forward for amendment of the Factory Acts.

Since the Act of 1887 there have followed only three minor Acts, based on the recommendation of the officials acting under the Acts, while two of them give effect to claims made by the miners before the Labour Commission. Thus, in 1894, the Coal Mines (Checkweigher) Act rendered it illegal for an employer ("owner, agent, or manager of any mine, or any person employed by or acting under the instructions of any such owner, agent, or manager") to make the removal of a particular checkweigher a condition of employment, or to exercise improper influence in the appointment of a checkweigher, carrying into effect the recommendations to the Labour Commission both of inspectors and miners. The need for this provision was demonstrated by a decision of the Court of Session in Edinburgh, which upheld an employer in his claim to the right of dismissing all the workmen and re-engaging them on condition that they would dismiss a particular checkweigher. In 1896 a short Act of seven sections extended the powers to propose, amend, and modify special rules, provided for representation of workmen on arbitration under the principal Act on any matter in difference, modified the provision for plans of mines in working and abandoned mines, amended three of the general rules (inspection before commencing work, use of safety lamp, and non-inflammable substances for stemming), and empowered the Secretary of State by order to prohibit or regulate the use of any explosive likely to become dangerous. In 1900 another brief Act raised the age of employment of boys underground from twelve to thirteen.

While the classes of mines regulated by the Act of 1887 are the same as those regulated by the Act of 1872 (*i.e.*, mines of coal, of stratified ironstone, of shale, and of fire-clay, including works above ground where the minerals are prepared for use by screening, washing, &c.), the interpretation of the term "mine" is rather wider and simpler, including "every shaft in the course of being sunk, and every level and inclined plane in the course of being driven, and all the shafts, levels, planes, works, tramways, and sidings, both below ground and above ground, in and adjacent to and belonging to the mine." Of the persons responsible under penalty for the observance of the Acts the term "owner" is defined precisely as in the Act of 1872, but the term "agent" is modified to mean "any person appointed as the representative of the owner in respect of any mine or any part thereof, and, as such, superior to a manager appointed in pursuance of this Act." Of the persons protected, the term "young person" disappears from the Act, and "boy," *i.e.*, "a male under the age of sixteen years," and "girl," *i.e.*, "a female under the age of sixteen years," take their place, and the term "woman"

means, as before, "a female of the age of sixteen years and upwards." The prohibition of employment underground of women and girls remains untouched, and the prohibition of employment underground of boys has been successively extended from boys of the age of ten in 1872 to boys of twelve in 1887 and to boys of thirteen in 1900. The age of employment of boys and girls above ground in connexion with any mine is raised from ten years in 1872 to twelve years since 1887. The hours of employment of a boy below ground may not exceed fifty-four in any one week, nor ten in any one day from the time of leaving the surface to the time of returning to the surface. Above ground any boy or girl under thirteen (and over twelve) may not be employed on more than six days in any one week; if employed on more than three days in one week, the daily total must not exceed six hours, or in any other case ten hours. Protected persons above thirteen are limited to the same daily and weekly total of hours as boys below ground, but there are further provisions with regard to intervals for meals and prohibiting employment for more than five hours without an interval of at least half an hour for a meal. Registers must be kept of all protected persons, whether employed above or below ground. Section 38 of the Public Health Act, 1875, which requires separate and sufficient sanitary conveniences for persons of each sex, was first extended by the Act of 1887 to the portions of mines above ground in which girls and women are employed. Ventilation, the only other requirement in the Acts that can be classed as sanitary, is provided for in every mine in the "general rules" which are aimed at securing safety of mines, and which, so far as ventilation is concerned, seek to dilute and render harmless noxious or inflammable gases. The provision which prohibits employment of any persons in mines not provided with at least two shafts is made much more stringent by the Act of 1887 than in the previous code, by increasing the distance between the two shafts from 10 to 15 yards, and increasing the height of communications between them. Other provisions amended or strengthened are those relating to the following points: (a) Daily personal supervision of the mine by the certificated manager; (b) classes of certificates and constitution of board for granting certificates of competency; (c) plan of workings of any mine to be kept up to a date not more than three months previously at the office of the mine; (d) notice to be given to the inspector of the district by the owner, agent, or manager, of accidents in or about any mine which cause loss of life or personal injury: it is provided that the place where an explosion or accident occurs causing loss of life or serious personal injury shall be left for inspection for at least three days, unless this would tend to increase or continue a danger or impede working of the mine: this was new in the Act of 1887; (e) notice to be given of opening and abandonment of any mine: this was extended to the opening or abandonment of any seam; (f) plan of an abandoned mine or seam to be sent within three months; (g) formal investigation of any explosion or accident by direction of the Secretary of State: this provision, first introduced by the Act of 1886, was modified in 1887 to admit of the appointment by the Secretary of State of "any competent person" to hold the investigation, whereas under the earlier section only an inspector could be appointed.

The "general rules" for safety in mines have been added to and strengthened in many ways since the Act of 1872. Particular mention may be made of rule 4 of the Act of 1887, relating to the inspection of conditions as to gas ventilation beyond appointed stations at the entrance to the mine or different parts of the mine; this rule generally removed the earlier distinction between mines in which inflammable gas has been found within the preceding twelve months, and mines in which

General rules.

it has not been so found; of rules 8, 9, 10, and 11, relating to the construction, use, &c., of safety lamps, which are more detailed and stringent than rule 7 of the Act of 1872, which they replaced; of rule 12, relating to the use of explosives below ground; of rule 24, which requires the appointment of a competent male person not less than twenty-two years of age for the purpose of working the machinery for lowering and raising persons at the mine; of rule 34, which first required provision of ambulances or stretchers with splints and bandages at the mine ready for immediate use; of rule 38, which strengthened the provision for periodical inspection of the mine by practical miners on behalf of the workmen at their own cost. With reference to the last-cited rule, it should be mentioned that during 1898 a Prussian mining commission visited Great Britain, France, and Belgium, with a view to studying and comparing the various methods of inspection by working miners established in these three countries. They found that, so far as the method had been applied, it was most satisfactory in Great Britain, where the whole cost is borne by the workers' own organizations, and they attributed part of the decrease in number of accidents per thousand employed since 1872 to the inauguration of this system.

The provisions as to the proposal, amendment, and modification of "special rules," last extended by the Act of 1896, may be contrasted with those of the Factory Act. In the latter

Special rules.

it is not until an industry or process has been scheduled as dangerous or injurious by the Secretary of State's order that occasion arises for the formation of special rules, and then the initiative rests with the Factory Department, whereas in mines it is incumbent in every case on the owner, agent, or manager to propose within three months of the commencement of any working, for the approval of the Secretary of State, special rules best calculated to prevent dangerous accidents, and to provide for the safety, convenience, and proper discipline of the persons employed in or about the mine. These rules may, if they relate to lights and lamps used in the mine, description of explosives, watering and damping of the mine, or prevention of accidents from inflammable gas or coal dust, supersede any general rule in the principal Act. Apart from the initiation of the rules, the methods of establishing them, whether by agreement or by resort to arbitration of the two parties (*i.e.*, the mine owners and the Secretary of State), are practically the same as under the Factory Act, but there is a special provision in the Mines Acts for enabling the persons working in the mine to transmit objections to the proposed rules, in addition to their subsequent right to be represented on the arbitration, if any.

Of the sections touching on wages questions, the prohibition of the payment of wages in public-houses remains unaltered, being re-enacted in 1887; the sections relating to payment by weight for amount of mineral gotten by persons employed, and for checkweighing the amount by a "checkweigher" stationed by the majority of workers at each place appointed for the weighing of the material, were revised, particularly as to the determination of deductions by the Act of 1887, with a view to meeting some of the problems raised by decisions on cases under the Act of 1872. The attempt seems not to have been wholly successful, the highest legal authorities having expressed conflicting opinions on the precise meaning of the terms "mineral contracted to be gotten." The whole history of the development of this means of securing the fulfilment of wage contract to the workers may be compared with the history of the sections affording protection to piece-workers by particulars of work and wages in the textile trades since the Factory Act of 1891.

As regards legal proceedings, the chief amendments of the Act of 1872 are: the extension of the provision that the "owner, agent, or manager" charged in respect of any contravention

Administration.

by another person might be sworn and examined as an ordinary witness, to any person charged with any offence under the Act. The result of the proceedings against workmen by the owner, agent, or manager in respect of an offence under the Act is to be reported within twenty-one days to the inspector of the district. The powers of inspectors were extended to cover an inquiry as to the care and treatment of horses and other animals used in the mine, and as to the control, management, or direction of the mine by the manager.

In 1900 the number of coal mines reported on was 3384, and the number of persons employed below ground was 624,223, of whom 47,663 were under 16 years of age. Above ground 155,829 were employed, of whom 4808 were women and girls. The number of separate fatal accidents was 962, causing the loss of 1012 lives. Of prosecutions by far the greater number were against workmen, numbering 646; owners and managers were prosecuted in 115 cases, and convictions obtained in 61 cases.

Quarries.—From 1878 until 1894 open quarries (as distinct from underground quarries regulated by the Metalliferous Mines Regulation Act) were regulated only by the Factory Acts so far as they then applied. It was

laid down in section 93 of the Act of 1878 (41 Vict. c. 16), that "any premises or place shall not be excluded from the definition of a factory or workshop by reason only that such premises, &c., are or is in the open air," thereby overruling the decision in *Kent v. Astley* that quarries in which the work, as a whole, was carried on in the open air were not factories; in a schedule to the same Act quarries were defined as "any place not being a mine in which persons work in getting slate, stone, coprolites, or other minerals." The Factory Act of 1891 made it possible to bring these places in part under "special rules" adapted to meet the special risks and dangers of the operations carried on in them, and by order of the Secretary of State they were certified, 27th December 1892, as dangerous, and thereby subject to special rules. Until then it was, as reported by one of H.M. Inspectors of Factories, the case that quarries had been placed under the Factory Acts without insertion of appropriate rules for their safe working, and that many of them were "developed in a most dangerous manner without any regard for safety, but merely for economy," and that managers of many had "scarcely seen a quarry until they became managers." In his report for 1892 it was recommended by H.M. Chief Inspector of Factories that quarries should be subject to the jurisdiction of H.M. Inspectors of Mines. At the same time currency was given, by the published reports of the evidence before the Royal Commission on Labour, to the wish of large numbers of quarrymen that open as well as underground quarries should come under more specialized Government inspection. In 1893 a committee of experts, including inspectors of mines and of factories, was appointed by the Home Office to investigate the conditions of labour in open quarries, and to make recommendations. This committee proposed rules covering points not provided for by the Factory Acts, but pointed out that they could not be enforced under existing legislation, and that no special rules applied in open quarries where neither women nor young persons were employed, and they expressed the opinion that further legislation was necessary.

In 1894 the Quarries Act was passed, which brought every quarry, as defined in the Factory Act, 1878, any part of which is more than 20 feet deep, under certain of the provisions of the Metalliferous Mines Acts, and under the inspection of the inspectors appointed under those Acts; further, preventing conflict of jurisdiction, it transferred the duty of enforcing the Factory and Workshop Acts, so far as they apply in quarries over 20 feet deep, from the Factory to the Metalliferous Mines inspectors. The provisions of the Metalliferous Mines Acts, 1872 and 1875, applied to quarries, are those relating to payment of wages in public-houses, notice of accidents to the inspector, appointment and powers of inspectors, arbitration, coroners' inquests, special rules, penalties, certain of the definitions, and the powers of the Secretary of State finally to decide disputed questions whether places come within the application of the Acts. For other matters, and in particular fencing of machinery and employment of women and young persons, the Factory Acts apply, with a proviso that nothing shall prevent the employment of young persons (boys) in three shifts for not more than eight hours each. In 1899 it was reported by H.M. Inspectors of Mines that special rules for safety had been established in over 2000 quarries. The absence or deficiency of external fencing to a quarry dangerous to the public has been since 1887 (50 and 51 Vict. c. 19) deemed a nuisance liable to be dealt with summarily in the manner provided by the Public Health Act, 1875.

In 1900, 93,895 persons were employed, of whom 60,631 worked inside the actual pits or excavations, and 33,264 outside. Compared with 1899, there was a total decrease of 4100 in the number of persons employed, 3528

being among inside workers. Fatal accidents resulted in 127 deaths; compared with 1899 there was an increase of 10 in the number of deaths. As Prof. Le Neve Foster points out, this exceeds the average death-rate of underground workers at mines under the Coal Mines Acts during the last ten years, in spite of the quarrier "having nothing to fear from explosions of gas, underground fires, or inundations." He attributes the difference to a lax observance of precautions which may in time be remedied by stringent administration of the law. In 1900 there were 92 prosecutions against owners or agents, with 67 convictions, and 13 prosecutions of workers, with 12 convictions.

In 1883 a short Act of five sections extended to all "workmen" who are manual labourers other than miners, with the exception of domestic or menial servants, the prohibition of payment of wages in public-houses, beer-shops, and other places for the sale of spirituous or fermented liquor, laid down in the Coal Mines Regulations and Metalliferous Mines Regulation Acts. The places covered by the prohibition include any office, garden, or place belonging to or occupied with the places named, but the Act does not apply to such wages as are paid by the resident, owner, or occupier of the public-house, beer-shop, and other places included in the prohibition to any workman *bonâ fide* employed by him. The penalty for an offence against this Act is one not exceeding £10 (compare the limit of £20 for the corresponding offence under the Coal Mines Act), and all offences may be prosecuted and penalties recovered in England and Scotland under the Summary Jurisdiction Acts. The Act, however, does not apply to Ireland, and no special inspectorate is charged with the duty of enforcing the Act, whether in relation to employes in factories, shops, docks, or elsewhere.

Shop Hours.—In four brief Acts, 1892 to 1899, the first very limited steps have been taken towards the regulation of the employment of shop assistants. In place of such general codes as apply to factories, laundries, mines—touching security, hygiene, limitation of daily periods, provision for holidays, &c.—only three kinds of protective requirement are binding on employers of shop assistants: (1) Limitation of the weekly total of hours of work of persons under eighteen years of age to seventy-four inclusive of meal-times; (2) prohibition of the employment of such persons in a shop on the same day that they have, to the knowledge of the employer, been employed in any factory or workshop for a longer period than would, in both classes of employment together, amount to the number of hours permitted to such persons in a factory or workshop; (3) provision for the supply of seats by the employer, in all rooms of a shop or other premises where goods are retailed to the public, for the use of female assistants employed in retailing the goods—the seats to be in the proportion of not fewer than one to every three female assistants. The first two of these requirements are contained in the Act of 1892, which also prescribed that a notice, referring to the provisions of the Act, and stating the number of hours in the week during which a young person may be lawfully employed in the shop, shall be kept exhibited by the employer; the third requirement was first provided by the Act of 1899. The two intervening Acts of 1893 and 1895 are merely supplementary to the Act of 1892; the former providing for the salaries and expenses of the inspectors which the council of any county or borough (and in the City of London the Common Council) were empowered by the Act of 1892 to appoint for the execution of the Act; the latter providing a penalty of forty shillings for failure of an employer to keep exhibited the notice of the provisions of the Acts which in the absence of a penalty it had hitherto been impossible to enforce. The penalty for employment contrary to the Acts is a fine not exceeding one pound for each person so employed, and for failure to comply with the requirement as to seats, a fine not exceeding three pounds for a first offence, and for any subsequent offence a fine of not less than one pound and not exceeding five pounds.

A wide interpretation is given by the Act of 1892 to the class of workplace to which the limitation of hours applies. "Shop" means retail and wholesale shops, markets, stalls, and warehouses in which assistants are employed for hire, and includes licensed public-houses and refreshment houses of any kind. The person responsible for the observance of the Acts is the "employer" of the "young persons" (*i.e.*, persons under the age of eighteen years), whose hours are limited, and of the "female assistants" for whom seats must be provided. Neither the term "employer" nor "shop assistant" (used in the title of the Act of 1899) is defined; but other terms have the meaning assigned to them in the Factory and Workshop Act, 1878. The "employer" has, in case of any contravention alleged, the same power as the "occupier" in the Factory Acts to exempt himself from fine on proof of due diligence and of the fact that some other person is the actual offender. The provisions of the Act of 1892 do not apply to members of the same family living in a house of which the shop forms part, or to members of the employer's family, or to any one wholly employed as a domestic servant.

In London, where the County Council has appointed 6 men and 3 women inspectors to apply the Acts of 1892 to 1899, there were, in 1900, 73,929 premises under inspection. All were visited at least once during the year, some repeatedly, and in 9204 irregularities were found. Proceedings were instituted in 117 cases, resulting in 93 convictions. In 1900 the number of young persons under the Acts were: indoors, 10,239 boys and 4428 girls; outdoors, 35,019 boys, 206 girls. As regards the Act of 1899, in only 1088 of the 14,844 shops affected in London was there failure to provide seats for the women employed in retailing goods. The Chief Officer of the Public Control Department reports that with very few exceptions the law is complied with at the end of the first year of its application.

As regards cleanliness, ventilation, drainage, water-supply, and sanitary condition generally, shops have been since 1878 (by 41 Vict. c. 16, sect. 101) subject to the provisions of the Public Health Act, 1875, which apply to all buildings, except factories under the Factory Acts, in which any persons, whatever their number be, are employed. Thus, broadly, the same sanitary provisions apply in shops as in workshops, but in the former these are enforced solely by the officers of the local authority, without reservation of any power, as in workshops for the Home Office inspectorate, to act in default of the local authority.

Shop assistants, so far as they are engaged in manual, not merely clerical labour, come also under the provisions of the Truck Acts 1831 to 1887, and in all circumstances they fall within the sections directed against unfair and unreasonable fines in the Truck Act of 1896; but, unlike employes in factories, workshops, laundries, and mines, they are left to apply these provisions so far as they can themselves, since neither Home Office inspectors nor officers of the local authority have any powers to administer the Truck Acts in shops.

Truck.—Setting aside the special Hosiery Manufacture (Wages) Act, 1874, which was aimed at a particular abuse appearing chiefly in the hosiery industry—the practice of making excessive charges on wages for machinery and frame rents—only two Acts have been added to the general law against truck since the Act of 1831, which repealed all prior Acts and which still remains the principal Act. The first of the two was the Truck Amendment Act, 1887, which amended and extended the Act without adding any distinctly new principle; the second was the Truck Act of 1896, which was directed towards providing remedies for matters clearly shown by various decisions under the earlier Truck Acts to be outside the scope of the principles and provisions of those Acts. Under the earlier Acts the main objects were: (1) to make the wages of workmen, *i.e.*, the reward of labour, payable only in current coin of the realm, and to prohibit whole or part payment of wages in food or drink or clothes or any other articles; (2) to forbid agreements, express or implied, between employer and workmen as to the manner or place in which, or articles on which, a workman shall expend his wages, or for the deduction of the price of articles (other than materials to be used in the labour of the workmen), supplied by the employer, from wages. The Act of 1887 added a further prohibition by making it illegal for an employer to charge interest on any advance of wages, "whenever by agreement, custom, or otherwise a workman is entitled to receive in anticipation of the regular period of the payment

The Truck Act, 1887.

of his wages an advance as part or on account thereof." Further, it strengthened the section of the principal Act which provided that no employer shall have any action against his workman for goods supplied at any shop belonging to the employer, or in which the employer is interested, by (a) securing any workman suing an employer for wages against any counter-claim in respect of goods supplied to the workman by any person under any order or direction of the employer, and (b) by expressly prohibiting an employer from dismissing any worker on account of any particular time, place, or manner of expending his wages. Certain exemptions to the prohibition of payment otherwise than in coin were provided for in the Act of 1831, if an agreement were made in writing and signed by the worker, viz., rent, victuals dressed and consumed under the employer's roof, medicine, fuel, provender for beasts of burden used in the trade, materials and tools for use by miners, advances for friendly societies or savings banks; in the case of fuel, provender, and tools, there was also a proviso that the charge should not exceed the real and true value. The Act of 1887 amended these provisions by requiring a correct annual audit in the case of deductions for medicine or tools, by permitting part payment of servants in husbandry in food, drink (not intoxicants) or other allowances, and by prohibiting any deductions for sharpening or repairing workmen's tools except by agreement not forming part of the condition of hiring. Two important administrative amendments were made by the Act of 1887: (1) a section similar to that in the Factory and Mines Acts was added, empowering the employer to exempt himself from penalty for contravention of the Acts on proof that any other person was the actual offender and of his own due diligence in enforcing the execution of the Acts; (2) the duty of enforcing the Acts in factories, workshops, and mines was imposed upon H.M. Inspectors of the Factory and Mines Departments respectively of the Home Office, and to their task they were empowered to bring all the authorities and powers which they possessed in virtue of the Acts under which they are appointed; these inspectors thus prosecute defaulting employers and recover penalties under the Summary Jurisdiction Acts, but they do not undertake civil proceedings for improper deductions or payments which would lie with workmen under the Employers and Workmen Act, 1875. The persons to whom the benefits of the

**Persons
benefitted
by Truck
Acts.**

Act applied were added to by the Act of 1887, which repealed the complicated list of trades contained in the principal Act and substituted the simpler definition of the Employers and Workmen Act just referred to. Thus the Acts 1831 to 1887, and also the Act of 1896, apply to all workers (men, women, and children) engaged in manual labour, except domestic servants; they apply not only in mines, factories, and workshops, but, to quote the published Home Office Memorandum on the Acts, "in all places where work-people are engaged in manual labour under a contract with an employer, whether or no the employer be an owner or agent or a parent, or be himself a workman; and therefore a workman who employs and pays others under him must also observe the Truck Acts." The law thus covers outworkers for a contractor or subcontractor. A decision of the High Court at Dublin in 1900 (*Squire v. Sweeney*) strengthened the inspectors in investigation of offences committed amongst outworkers by supporting the contention that inquiry and exercise of all the powers of an inspector could legally take place in parts of an employer's premises other than those in which the work is given out. It defined for Ireland, in a narrower sense than had hitherto been understood, the classes of outworkers protected, by deciding that only

such as were under a contract personally to execute the work were covered.

At the time of the passing of the Act of 1887 it seems to have been generally believed that the obligation under the principal Act to pay the "entire amount of wages earned" in coin precluded and rendered illegal any deductions from wages in respect of fines. Important decisions in 1888 and 1889 showed this belief to have been ill-founded. The essential point lies in the definition of the word "wages" as the "*recompense, reward, or remuneration of labour,*" ^{Meaning of "wages."} which implies not necessarily any gross sum in question between employer and workmen where there is a contract to perform a certain piece of work, but that part of it, the real *net* wage, which the workman was to get as his *recompense* for the labour performed. As soon as it became perfectly clear that excessive deductions from wages as well as payments by workers for materials used in the work were not illegal, and that deductions or payments by way of compensation to employers or by way of discipline might legally (with the single exception of fines for lateness for women and children, regulated by the Employers and Workmen Act, 1875) even exceed the degree of loss, hindrance, or damage to the employer, it also came clearly into view that further legislation was desirable in order to extend the principles at the root of the Truck Acts. It was desirable, that is to say, to hinder more fully the unfair dealing that may be encouraged by half-defined customs in work-places, on the part of the employer in making a contract, while at the same time leaving the principle of freedom of contract as far as possible untouched. The Truck Act of 1896 regulates the conditions ^{The Truck Act, 1896.} under which deductions can be made by or payments made to the employer, out of the "sum contracted to be paid to the worker," *i.e.*, out of any gross sum whatever agreed upon between employer and workman. It makes such deductions or payments illegal unless they are in pursuance of a contract; and it provides that deductions (or payments) for (a) fines, (b) bad work and damaged goods, (c) materials, machines, and any other thing provided by the employer in relation to the work shall be reasonable, and that particulars of the same in writing shall be given to the workman. In none of the three cases mentioned is the employer to make any profit; neither by fines, for they may only be imposed in respect of acts or omissions which cause, or are likely to cause, loss or damage; nor by sale of materials, for the price may not exceed the cost to the employer; nor by deductions or payments for damage, for these may not exceed the actual or estimated loss to the employer. Fines and charges for damage must be "fair and reasonable having regard to all the circumstances of the case," and no contract could make legal a fine which a court held to be unfair to the workman in the sense of the Act. The contract between the employer and workman must either be in writing signed by the workman, or its terms must be clearly stated in a notice constantly affixed in a place easily accessible to the workman, who shall be entitled, on request, to obtain from the employer a copy of the notice free of charge. On each occasion when a deduction or payment is made, full particulars in writing must be supplied to the workman. The employer is bound to keep a register of deductions or payments, and to enter therein particulars of any fine made under the contract, specifying the amount and the nature of the act or omission in respect of which the fine was imposed. This register must be at all times open to inspection by inspectors of mines or factories, who are also entitled to make a copy of the contract or any part of it. This Act as a whole applies to all workmen included

under the earlier Truck Acts; but, further, the sections relating to fines apply also in the case of any shop assistants. The latter, however, apparently are left to enforce the provisions of the law themselves, as no inspectorate is empowered to intervene on their behalf. In these and other cases a prosecution under the Truck Acts may be instituted by any person. Any workman or shop assistant may recover any sum deducted by or paid to his employer contrary to the Act of 1896, provided that proceedings are commenced within six months, and that where he has acquiesced in the deduction or payment he shall only recover the excess over the amount which the court may find to have been fair and reasonable in all the circumstances of the case. It is expressly declared in the Act that nothing in it shall affect the provisions of the Coal Mines Acts with reference to payment by weight, or legalize any deductions, from payments made, in pursuance of those provisions. The powers and duties of inspectors are extended to cover the case of a laundry, and of any place where work is given out by the occupier of a factory or workshop or by a contractor or sub-contractor. Power is reserved for the Secretary of State to exempt by order specified trades or branches of them in specified areas from the provisions of the Act of 1896, if he is satisfied that they are unnecessary for the protection of the workmen. This power has been exercised only in respect of one highly organized industry, the Lancashire cotton industry. The effect of the exemption is not to prevent fines and deductions from being made, but the desire for it demonstrated that there are cases where leaders among workers feel competent to make their own terms on their own lines without the specific conditions laid down in this Act. The reports of H.M. Inspectors of Factories demonstrate that in other industries much work has to be done under this Act, and knowledge of a highly technical character to be acquired, before opinions can be formed as to the reasonableness and fairness, or the contrary, of many forms of deduction. For the year 1898 it was reported that convictions were obtained for breaches, in factories and workshops, of the various Truck Acts in 66 cases out of 82 taken before the courts, an average penalty of 10s. 9d. having been imposed. In the year 1899, 20 convictions were obtained in 38 cases, the average penalty being £20, 0s. 5d. In 1900, 26 cases were taken into court, and 21 convictions were obtained, the average penalty being 18s. 5d.

II. CONTINENTAL EUROPE.

In comparing legislation affecting factories, mines, shops, and truck in the chief industrial countries of the Continent with that of Great Britain, it is essential to a just view that inquiry should be extended beyond the codes themselves to the general social order and system of law and administration in each country. Further, as a starting-point, special comparison of the definitions and the sanctions of each industrial code must be recognized as necessary, for these vary in all. In so brief a summary as is appended here no more is possible than an outline indication of the main general requirements and prohibitions of the laws as regards: (1) hours and times of employment, (2) ordinary sanitation and special requirements for unhealthy and dangerous industries, (3) security against accidents, and (4) prevention of fraud and oppression in fulfilment of wage contracts. As regards the first of these subdivisions, in general in Europe the ordinary legal limit is rather wider than in Great Britain, being in most cases not less than 11 hours a day, and the administrative discretion in granting exceptions rather more elastic. The weekly half-holiday is a peculiarly British institution. On the other hand, in several Euro-

pean countries, notably France, Austria, and Russia, the legal maximum day applies to adult as well as youthful labour, and not only to specially protected classes of persons. As regards specialized sanitation for unhealthy factory industries, German regulations appear to be most nearly comparable with British. Mines' labour regulation in several countries, having an entirely different origin linked with ownership of mines, is only in few and most recent developments comparable with British Mines Regulation Acts. In regulation of shops, Germany, treating this matter as an integral part of her imperial industrial code, has advanced farther than has Great Britain. In truck legislation most European countries appear to have been influenced by the far earlier laws of Great Britain, although in some respects Belgium, with her rapid and recent industrial development, has made interesting original experiments.

France.—Hours of labour were, in France, first limited in factories (*usines et manufactures*) for adults by the law of 9th September 1848 to 12 in the 24. Much uncertainty existed as to the class of workplaces covered, and various interpretations were given. Finally, in 1885, an authoritative decision defined them as including: (1) Industrial establishments with motor power or continual furnaces, (2) workshops employing over 20 workers. In 1851, under condition of notification to the local authorities, exceptions, still in force, were made to the general limitation, in favour of certain industries or processes, among others for letterpress and lithographic printing, engineering works, work at furnaces and in heating workshops, manufacture of projectiles of war, and any work for the Government in the interests of national defence or security. The limit of 12 hours was reduced, as regards works in which women or young workers are employed, in 1900 to 11, and was to be successively reduced to 10½ hours and to 10 hours at intervals of two years from April 1900. This labour law for adults was preceded in 1841 by one for children, which prevented their employment in factories before 8 years of age and prohibited night labour for any child under 13. This was strengthened in 1874, particularly as regards employment of girls under 21, but it was not until 1892 that the labour of women was specially regulated by a law still in force, with certain amendments in 1900. Under this law factory and workshop labour is prohibited for children under 13 years, though they may begin at 12 if qualified by the prescribed educational certificate and medical certificate of fitness. The limit of daily hours of employment is the same as for adult labour, and, similarly, from 1st April 1902 was 10½, and two years later will be 10 hours in the 24. Notice of the hours must be affixed, and meal-times or pauses with absolute cessation of work of at least 1 hour must be specified. One day in the week, not necessarily Sunday, must be given for entire absence from work, in addition to eight recognized annual holidays. Night labour—that is, work between 9 p.m. and 5 a.m.—is prohibited for workers under 18 years, and only exceptionally permitted, under conditions, for girls and women over 18 in specified trades. In mines and underground quarries employment of women and girls is prohibited except at surface works, and at the latter is subject to the same limits as in factories. Boys of 13 years may be employed in certain work underground, but under 16 years may not be employed more than 8 hours in the 24 from bank to bank. As in Great Britain, distinct services of inspection enforce the law in factories and mines respectively. In factories and workshops an inspector may order re-examination as to physical fitness for the work imposed of any worker under 16; certain occupations and processes are prohibited—*e.g.*, girls under 16 at machines worked by treadles, and the weights that may be lifted, pushed, or carried by girls or boys under 18 are carefully specified. The law applies generally to philanthropic and religious institutions where industrial work is carried on, as in ordinary trading establishments; and this holds good even if the work is by way of technical instruction. Domestic workshops are not controlled unless the industry is classed as dangerous or unhealthy; introduction of motor power brings them under inspection. General sanitation in industrial establishments is provided for in a law of 1893, and is supplemented by administrative regulations for special risks due to poisons, dust, explosive substances, gases, fumes, &c. Ventilation, both general and special, lighting, provision of lavatories, cloakrooms, good drinking water, drainage, and cleanliness are required in all workplaces. In many industries women, children, and young workers are either absolutely excluded from specified unhealthy processes, or are admitted only under conditions. As regards shops and offices, the only labour laws are: one which protects apprentices against overwork (law of 22nd February 1851), and one (law of 29th December 1900) which requires that seats shall be provided for women and girls employed in retail sale of articles. The latter law is enforced by the inspectors of factories. In France there is no special penal

legislation against abuses of the truck system, or excessive fines and deductions from wages, although bills have frequently been before Parliament. Indirect protection to workers is no doubt in many cases afforded in organized industries by the action of the *Conseils de Prud'hommes*.

Belgium.—In 1848 in Belgium the Commission on Labour proposed legislation to limit, as in France, the hours of labour for adults, but this never passed, though repeated attempts were made to secure it. Belgian regulation of labour in industry remains essentially, in harmony with its earliest beginnings in 1863 and onwards, a series of specialized provisions to meet particular risks of individual trades, and did not, until 1899, give any adherence to a common principle of limitation of hours and times of labour for "protected" persons. This was in the law of 13th December 1889, which applies to mines, quarries, factories, workshops, classed as unhealthy, wharves and docks, transports. As in France, industrial establishments having a charitable or philanthropic or educational character are included. The persons protected are girls and women under 21 years, and boys under 16; and women over 21 years only find a place in the law through the prohibition of their employment within four weeks after childbirth. Just as the hours of labour of adult women remain absolutely unlimited by law, so are the hours of boys from 16 to 21. The absolute prohibitions of employment are: for children under 12 years in any industry, manufacturing or mining or transport, and for women and girls under 21 years below the surface in working of mines. Boys under 16 years and women and girls under 21 years may in general not be employed before 5 a.m. or after 9 p.m., and one day in the seven is to be set apart for rest from employment; to these rules, however, exception may be made either by royal decree for classes or groups of processes, or by local authorities in exceptional cases. The exceptions may be applied, generally, only to workers over 14 years, but in mines, by royal decree, boys over 12 years may be employed from 4 a.m. The law of 1889 fixes only a maximum of 12 hours of effective work, to be interrupted by pauses for rest of not less than 1½ hours, empowering the king by decree to formulate more precise limits suited to the special circumstances of individual industries. Royal decrees have accordingly laid down the conditions for twenty-six groups, including textile trades, manufacture of paper, pottery, glass, clothing, mines, quarries, engineering and printing works. In some the daily limit is 10 hours, but in more 10½ or 11 hours. In a few exceptionally unhealthy trades, such as the manufacture of lucifer matches, vulcanization of india-rubber by means of carbon bisulphide, the age of exclusion from employment has been raised, and in the last-named process hours have been reduced to 5, broken into two spells of 2½ hours each. As a rule the conditions of health and safeguarding of employments in exceptionally injurious trades have been sought by a series of decrees under the law of 1863 relating to public health in such industries. Under this, special regulations for safety of workers have been introduced in manufactures of white-lead, oxides of lead, chromate of lead, lucifer match works, rag and shoddy works; and for dangers common to many industries, provisions against dust, poisons, accidents, and other risks to health or limb have been codified in a decree of 1896. In 1898 a law was passed to enable the authorities to deal with risks in quarries under the same procedure. Safety in mines (which are not private property, but state concessions to be worked under strict state control) has been provided for since 1810. In matters of hygiene, however, until 1899 the powers of the public health authorities to intervene were insufficient, and a law was passed authorizing the Government to make regulations for every kind of risk in any undertaking, whether classed under the law of public health or not. By a special law of 1888 children and young persons under 18 years are excluded from employment as pedlars, hawkers, or in circuses, except by their parents, and then only if they have attained 14 years. Abuses of the truck system have, since 1887, been regulated with care. The chief objects of the law of 1887 were to secure payment in full to all workers, other than those in agriculture or domestic service, of wages in legal tender, to prohibit payment of wages in public-houses, and to secure prompt payment of wages. Certain deductions were permitted under careful control for specific customary objects: lodging, use of land, uniforms, food, firing. The law of 15th June 1896 regulates the affixing in workplaces, where at least five workers are employed, of a notice of the working rules, the nature and rate of fines, if any, and the mode of their application. Two central services, the mines inspectorate and the factory and workshop inspectorate, divide the duties above indicated. There is also a system of local administration of the regulations relating to industries classed as unhealthy, but the tendency has been more and more to give the supreme control in these matters to the factory service, with its expert staff.

Holland.—The first law for regulation of labour in manufacture was passed in 1874, and this related only to employment of children. In 1889, after many attempts had been made to amend

the law, the basis of all existing regulations was established in the law of 5th May 1889, which applies to all industrial undertakings, excluding agriculture and forestry, fishing, stock-rearing. Employment of children under 12 years is prohibited, and hours are limited for young persons under 16 and for women of any age. These protected persons may be excluded by royal decree from unhealthy industries, and such industries are specified in a decree of 1897 which supersedes other earlier regulations. Hours of employment must not exceed 11 in the 24, and at least 1 hour for rest must be given between 11 a.m. and 3 p.m., which hour must not be spent in a work-room. Work before 5 a.m. or after 7 p.m., Sunday work, and work on recognized holidays is generally prohibited, but there are exceptions. Overtime from 7 to 10 p.m. under conditions is allowed for women and young workers, and Sunday work for women, for example, in butter and cheese making, and night work for boys over 14 in certain industries. Employment of women within four weeks of childbirth is prohibited. Notices of working hours must be affixed in workplaces. Underground work in mines is prohibited for women and young persons under 16, but only two mines, employing in all some 300 persons, are worked in Holland. In 1895 the first legislative provision was made for protection of workers against risk of accident or special injury to health. Sufficient cubic space, lighting, ventilation, sanitary accommodation, reasonable temperature, removal of noxious gases or dust, fencing of machinery, precautions against risk from fire and other matters are provided for. The manufacture of lucifer matches by means of white phosphorus has been forbidden by a law of 28th May 1901. No penal provision against truck exists in Holland, but possibly abuses of the system are prevented by the existence of industrial councils representing both employers and workers, with powers to mediate or arbitrate in case of disputes between the two parties.

Switzerland.—In Switzerland separate cantonal legislation prepared the way for the general Federal labour law of 1877 on which subsequent legislation rests. Such legislation is also cantonal as well as Federal, but in the latter there is only amplification or interpretation of the principles contained in the law of 1877, whereas cantonal legislation covers industries not included under the Federal law, e.g., single workers employed in a trade (*métier*) and employment in shops, offices, and hotels. The Federal law is applied to factories, workshops employing young persons under 18 or more than 10 workers, and workshops in which unhealthy or dangerous processes are carried on. Mines are not included, but are regulated in some respects as regards health and safety by cantonal laws. Further, the Law of Employers' Liability, 1881-87, which requires in all industries precautions against accidents and reports of all serious accidents to the cantonal governments, applies to mines. This led, in 1896, to the creation of a special mining department, and mines, of which there are but few, have to be inspected once a year by a mining engineer. The majority of the provisions of the Federal labour law apply to adult workers of both sexes, and the general limit of the 11-hours' day, exclusive of at least 1 hour for meals, applies to men as well as women. The latter have, however, a legal claim, when they have a household to manage, to leaving work at the dinner-hour half an hour earlier than the men. Men and unmarried women may be employed in such subsidiary work as cleaning before or after the general legal limits. On Saturdays and eves of the eight public holidays the 11-hours' day is reduced to 10. Sunday work and night work are forbidden, but exceptions are permitted conditionally. Night work is defined as 8 p.m. to 5 a.m. in summer, 8 p.m. to 6 a.m. in winter. Children are excluded from employment in workplaces under the law until 14 years of age, and until 16 must attend continuation schools. Zürich canton has strengthened the law by fixing the working day for women at 10 hours generally, and 9 hours on Saturdays and eves of holidays. In the German cantons girls under 18 years are not permitted to work overtime; in all cantons except Glarus the conditional overtime of 2 hours must be paid for at an enhanced wage.

Sanitary regulations and fencing of machinery are provided for with considerable minuteness in a Federal decree of 1897. The plans of every new factory must be submitted to the cantonal government. In the case of lucifer match factories, not only the building but methods of manufacture must be submitted. Since 1901 the manufacture, sale, and import of matches containing white phosphorus have been forbidden. Women must be absent from employment during eight weeks before and after childbirth. In certain dangerous occupations, e.g., where lead or lead compounds are in use, women may not legally be employed during pregnancy. Legislative provision against abuses of the truck system appears to be of earlier origin in Switzerland (17th century) than any other European country outside England (15th century). The Federal Labour Law, 1877, generally prohibits payment of wages otherwise than in current coin, and provides that no deduction shall be made without an express contract. Some of the cantonal laws go much farther than the British Act of 1896 in forbidding certain deductions; e.g., Zürich prohibits any charge

whatever for cleaning, warming, or lighting workrooms, or for hire of machinery. By the Federal law fines may not exceed half a day's wage. Administration of the labour laws is divided between inspectors appointed by the Federal Government and local authorities, under supervision of the cantonal governments. The Federal Government forms a court of appeal against decisions of the cantonal governments.

Germany.—Regulation of the conditions of labour in industry throughout the German Empire is provided for in the Imperial Industrial Code and the orders of the Federal Council based thereon. This Code is based on earlier industrial codes of the separate states, but more especially on the Code of 1869 of the North German Confederation. It applies in whole or in part to all trades and industrial occupations, with the exception of transport, fisheries, and agriculture. Mines are only included so far as truck, Sunday and holiday rest, prohibition of employment underground of female labour, limitation of the hours of women and young workers are concerned; otherwise the regulations for protection of life and limb of miners vary, as do the mining laws of the different states. In order to estimate the force of the Industrial Code in working, it is necessary to bear in mind the complicated political history of the Empire, the separate administration by the federated states, and the generally considerable powers vested in administration of initiating regulations. The Industrial Code expressly retains power for the states to initiate certain additions or exceptions to the Code which in any given state may form part of the law regulating factories there. The Code (unlike the Austrian Industrial Code) lays down no general limit for a normal working day for adult male workers, but since 1891 full powers were given to the Imperial Government to limit hours for any classes of workers in industries where excessive length of the working day endangers the health of the worker (R. G. O. § 120e). Previously application had been made of powers to reduce the working day in such unhealthy industries as silvering of mirrors by mercury and the manufacture of white-lead. Separate states had, under mining laws, also limited hours of miners. Sunday rest was, in 1891, secured for every class of workers, commercial, industrial, and mining. Annual holidays were also secured on Church festivals. These provisions, however, are subject to exceptions under conditions. An important distinction has to be brought out when we turn to the regulations for hours and times of labour for protected persons (women, young persons, and children). Setting aside for the moment hours of shop assistants (which are under special sections since 1900), it is to "factory workers" and not to industrial workers in general that these limits apply, although they may be, and in some instances have been, further extended—for instance, in ready-made clothing trades—by imperial decree to workshops. The term "factory" (*Fabrik*) is not defined in the Code, but it is clear from various decisions of the Supreme Court that it only in part coincides with the English term, and that some workplaces, where processes are carried on by aid of mechanical power, rank rather as English workshops. The distinction is rather between wholesale manufacturing industry, with subdivision of labour, and small industry, where the employer works himself. Certain classes of undertaking, viz., forges, timber-yards, dock-yards, brickfields, and open quarries, are specifically ranked as factories. Employment of protected persons at the surface of mines and underground quarries, and in salt works and ore-dressing works, and of boys underground comes under the factory regulations. These exclude children from employment under 13 years, and even later if an educational certificate has not been obtained; until 14 years hours of employment may not exceed 6 in the 24. Germany, unlike Great Britain, France, and Switzerland, requires a shorter day for young persons than for women—10 hours for the former, 11 hours for the latter. Women over 16 years may be employed 11 hours. Night work is forbidden, *i.e.*, work between 8.30 p.m. and 5.30 a.m. Overtime may be granted to meet special unforeseen pressure or for work on perishable articles, under conditions, by local authorities and the higher administrative authorities. Prescribed meal-times are—an unbroken half-hour for children in their 6 hours; for young persons a mid-day pause of 1 hour, and half an hour respectively in the morning and afternoon spells; for women, an hour at mid-day, but women with the care of a household have the claim, on demand, to an extra half-hour, as in Switzerland. No woman may be employed within four weeks after childbirth, and unless a medical certificate can then be produced, the absence must extend to six weeks. Notice of working periods and meal-times must be affixed, and copies sent to the local authorities. Employment of protected persons in factory industries where there are special risks to health or morality may be forbidden or made dependent on special conditions. All industrial employers alike are bound to arrange and maintain workrooms and machinery, and to organize labour in such a manner as to secure workers against injury to health and to ensure good conduct and propriety. Sufficient light, suitable cloak-rooms and sanitary accommodation, and ventilation to carry off dust, vapours, and other impurities are especially required. Dining-rooms may be ordered by local authori-

ties. Fencing and provision for safety in case of fire are required in detail. The work of the trade accident insurance associations in their work of preventing accidents is especially recognized in provisions for special rules in dangerous or unhealthy industries. Officials of the state factory departments are bound to give opportunity to trustees of the trade associations to express an opinion on special rules. In a large number of industries the Federal Council has laid down special rules comparable with those for unhealthy occupations in Great Britain. The relations between the state inspectors of factories and the ordinary police authorities are regulated in each state by its constitution. Prohibitions of truck in its original sense—that is, payment of wages otherwise than in current coin—apply to any persons under a contract of service with an employer for a specified time for industrial purposes; members of a family working for a parent or husband are not included; out-workers are covered. Control of fines and deductions from wages applies only in factory industries and shops employing at least 20 workers. Shop hours are regulated by requiring shops to be closed generally between 9 p.m. and 5 a.m., by requiring a fixed mid-day rest of 1½ hours and at least 10 hours' rest in the 24 for assistants. These limits can be to a certain extent modified by administrative authority. Notice of hours and working rules must be affixed. During the hours of compulsory closing sale of goods on the streets or from house to house is forbidden. Under the Commercial Code, as under the Civil Code, every employer is bound to adopt every possible measure for maintaining the safety, health, and good conduct of his employes. By an order of the Imperial Chancellor under the Commercial Code seats must be provided for commercial assistants and apprentices.

Austria.—The Industrial Code of Austria, which in its present outline (modified by later enactments) dates from 1883, must be carefully distinguished from the Industrial Code of the kingdom of Hungary. The latter is, owing to the predominantly agricultural character of the population, of later origin, and hardly had practical force before the law of 1893 provided for inspection and prevention of accidents in factories. No separate mining code exists in Hungary, and conditions of labour are regulated by the Austrian law of 1854. The truck system is repressed on lines similar to those in Austria and Germany. As regards limitation of hours of adult labour, Hungary may be contrasted with both those empires in that no restriction of hours applies either to men's or women's hours, whereas in Austrian factories both are limited to an 11-hours' day with exceptional overtime for which payment must always be made to the worker. The Austrian Code has its origin, however, like the British Factory Acts, in protection of child labour against abuse in the end of the 18th and beginning of the 19th century. Its present scope is determined by the Imperial "Patent" of 1859, and all industrial labour is included except mining, transport, fisheries, forestry, agriculture, and domestic industries. Factories are defined as including industries in which a "manufacturing process is carried on in an enclosed place by the aid of not less than twenty workers working with machines, with subdivision of labour, and under an employer who does not himself manually assist in the work." In smaller handicraft industries the compulsory guild system of organization still applies. In every industrial establishment, large or small, the sanitary and safety provisions, general requirement of Sunday rest, and annual holidays (with conditional exceptions), prohibition of truck and limitation of the ages of child labour apply. Night work for women, 8 p.m. to 5 a.m., is prohibited only in factory industries; for young workers it is prohibited in any industry. Pauses in work are required in all industries; 1 hour at least must be given at mid-day, and if the morning and afternoon spells exceed 5 hours each, another half-hour's rest at least must be given. Children may not be employed in industrial work before 12 years, and then only 8 hours a day at work that is not injurious and if educational requirements are observed. The age of employment is raised to 14 for "factories," and similarly there the work must be such as will not hinder physical development. Women may not be employed in regular industrial occupation within one month after childbirth. In certain scheduled unhealthy industries, where certificates of authorization from local authorities must be obtained by intending occupiers, conditions of health and safety for workers can be laid down in the certificate. The Minister of the Interior is empowered to draw up regulations prohibiting or making conditions for the employment of young workers or women in dangerous or unhealthy industries. The provisions against truck cover not only all industrial workers engaged in manual labour under a contract with an employer, but also shop-assistants; the special regulations against fines and deductions apply to factory workers and shops where at least 20 workers are employed. In mines under the law of 1884, which supplements the general mining law, employment of women and girls underground is prohibited; boys from 12 to 16 and girls from 12 to 18 may only be employed at light work above ground; 14 is the earliest age of admission for boys underground.

The shifts from bank to bank must not exceed 12 hours, of which not more than 10 may be effective work. Sunday rest must begin not later than 6 A.M., and must be of 24 hours' duration. These last two provisions do not hold in case of pressing danger for safety, health, or property. Sick and accident funds and mining associations are legislated for in minutest detail. The general law provides for safety in working, but special rules drawn up by the district authorities lay down in detail the conditions of health and safety. As regards manufacturing industry, it is important to note that the Industrial Code lays no obligation on employers to report accidents, and that until the Accident Insurance Law of 1889 came into force no statistics were available. In Austria, unlike Germany, the factory inspectorate is organized throughout under a central chief-inspector.

Scandinavian Countries.—The latest legislation in these countries is, as might be expected, in the two countries where manufacturing industry has the widest scope. In Sweden the Factory Law was amended in January 1901; in Denmark in July 1901. Until that year, however, Norway was in some respects in advance of the other two countries by its law of 1892, which applied to industrial works, including metal works of all kinds and mining. Women were thereby prohibited from employment: (a) underground; (b) in cleaning or oiling machinery in motion; (c) during six weeks after giving birth to a child, unless provided with a medical certificate stating that they might return at the end of four weeks without injury to health; (d) in dangerous, unhealthy, or exhausting trades during pregnancy. Further, work on Sundays and public holidays is prohibited to all workers, adult and youthful, with conditional exceptions under the authority of the inspectors. Children over 12 are admitted to industrial work on obtaining certificates of birth, of physical fitness, and of elementary education. The hours of children are limited to 6, with pauses, and of young persons (of 14 to 18 years) to 10, with pauses. Night work between 8 P.M. and 6 A.M. is prohibited. All workers are entitled to a copy of a code of factory rules containing the terms of the contract of work drawn up by representatives of employés with the employers and sanctioned by the inspector. Health and safety in working are provided for in detail in the same law of 1892. Special rules may be made for dangerous trades, and in 1899 such rules were established for match factories, similar to some of the British rules, but notably providing for a dental examination four times yearly by a doctor. In Denmark, regulation began with unhealthy industries, and it was not until the law of 1901 came into force, on 1st January 1902, that children under 12 years have been excluded from factory labour. In Sweden this 12 years' limit has for some time held in the larger factories, but now the scope has been extended so that it corresponds with the Norwegian law. The hours of children are, in Denmark, 6½ for those under 14 years; in Sweden 6 for those under 13 years. Young persons may not in either country work more than 10 hours daily, and night work, which is forbidden for persons under 18 years, is now defined as in Norway. Women may not be employed in industry within four weeks of childbirth, except on authority of a medical certificate. All factories in Sweden where young workers are employed are subject to medical inspection once a year. Fencing of machinery and hygienic conditions (ventilation, cubic space, temperature, light) are regulated in detail. In Denmark the use of white phosphorus in manufacture of lucifer matches has been prohibited since 1874.

Italy and Spain.—The wide difference between the industrial development of these southern Latin countries and the two countries with which this summary begins, and the far greater importance of the agricultural interests, produce a situation, as regards labour legislation, which makes it convenient to touch on the limited scope of their regulations at the close of the series. It was stated by competent and impartial observers from each of the two countries, at the International Congress on Labour Laws held at Brussels in 1897, that the lack of adequate measures for protection of child-labour and inefficient administration of such regulations as exist was responsible for abuse of their forces that can be found in no other European countries. "Their labour in factories, workshops, and mines constitutes a veritable martyrdom" (Spain). "I believe that there is no country where a sacrifice of child life is made that is comparable with that in certain Italian factories and industries" (Italy). In neither country is there any limitation of women's hours, but in Spain a step in this direction has been taken by a law of 1900, which was to take effect in 1902, in regulations for reduction of hours of labour for adults to 11, normally, in the 24. Hours of children under 14 must not exceed 6 in any industrial work nor 8 in any commercial undertaking. Labour before the age of 10 years and night work between 6 P.M. and 5 A.M. was prohibited, and powers were taken to extend the prohibition of night work to young persons under 16 years. The labour of children in Italy is still regulated in the main by a law of 1886, but a royal decree of 1899 has strengthened it by classing night work for children under 12 years as "injurious," such

work being thereby generally prohibited for them, though exceptions are admitted; at the same time it was laid down that children from 12 to 15 years might not be employed for more than 6 hours at night. The law of 1886 prohibits employment of children under 9 years in industry and under 10 years in underground mining. It is in the direction of fencing and other safeguards against accidents and as regards sanitary provisions, both in industrial workplaces and in mines, that Italy has made most advance since her law of 1890 for prevention of accidents.

III. UNITED STATES.

Under the general head of Labour Legislation all American statute laws regulating labour, its conditions, and the relation of employer and employé must be classed. It includes what is properly known as factory legislation. Labour legislation belongs to the last half of the 19th century, so far as the United States is concerned. Like England in the far past, the United States in colonial days undertook to regulate wages and prices, and later the employment of apprentices. Legislation relating to wages and prices was long ago abandoned, but the laws affecting the employment of apprentices still exist in some form, although the conditions of employment have changed so materially that apprenticeships are not entered as of old; but the laws regulating the employment of apprentices were the basis on which English legislation found a foothold when Parliament wished to regulate the labour of factory operatives. The whole code of labour laws of the present time is almost entirely the result of the industrial revolution which took place during the latter part of the 18th century, under which the domestic or hand-labour system was gradually but rapidly displaced through the

introduction of power machinery. As this revolution took place in the United States at a somewhat later date than in England, where it began, the labour legislation necessitated by it belongs to a later date. The factory, so far as textiles are concerned, was firmly established in America during the period from 1820 to 1840, and it was natural that the English legislation found friends and advocates in the United States, although the more objectionable conditions accompanying the English factory were not to be found there.

The first attempt to secure legislation regulating factory employment related to the hours of labour, which were very long, the day's work consisting of from twelve to thirteen hours. As machinery was introduced it was felt that the day's work should be shortened, as the tension resulting from speeded machines and the close attention required in the factory ought to be accompanied by a shorter work-day. This view took very firm hold of the operatives, and was the chief cause of the agitation which has resulted in a great body of laws applying in very many directions. The labour legislation as it exists now can be classified into two general branches—first, that relating to the conditions of employment; second, that relating to the protection of employes from practices tending to prevent them from obtaining or retaining employment. As early as 1806 the caulkers and shipbuilders of New York City agitated for a reduction of hours to ten per day, but no legislation followed their efforts. There were several attempts in the early years of the 19th century to secure some regulation relative to hours, but there was no general agitation prior to 1831. As Massachusetts was the state which first recognized the necessity of regulating employment (following in a measure, and so far as conditions demanded, the English labour or factory legislation), the history of such legislation in that state is indicative of that in the United States, and as it would be impossible in this article to give a detailed history of the origin of laws in the different states, the dates of their enactment, and their provisions, it is best to follow primarily the course of the Eastern states, and especially that of Massachusetts, where the first general agitation took place and the first laws were enacted. That state in 1836 regulated by law the question of the education of young persons employed in manufacturing establishments. There was no legislation until 1863 coming under the head of this article, except laws relating to the subject of education of children in factories. The question of regulating the hours of labour was warmly discussed in 1832, and several legislative committees and commissions reported upon it, but no specific action on the general question of hours of labour secured the indorsement of the Massachusetts legislature until 1874, although the day's labour of children under twelve years of age was limited to ten hours in 1842. Ten hours constituted a day's labour, on a voluntary basis, in many trades in Massachusetts and other parts of the country as early as 1853, while in the ship-building trades this was the work-day in 1844. In April 1840 President Van Buren issued an order "that all public establishments will hereafter be regulated, as to working hours, by the ten-hours system." After this the short-hours movement did not progress with any rapidity, or even persistency, yet there was a constantly increasing belief that a shorter work-day should prevail. The real aggressive movement began in 1845, through numerous petitions to the Massachusetts legislature urging a reduction of the day's labour to eleven hours, but nothing came of these petitions at that time. Again, in 1850, a similar effort was made, and also in 1851 and 1852, but the Bills failed. Then there was a period of quiet until 1865, when

an unpaid commission made a report relative to the hours of labour, and recommended the establishment of a bureau of statistics for the purpose of collecting data bearing upon the labour question. This was the first step in this direction in any country. The first bureau of the kind was established in Massachusetts in 1869, but meanwhile, in accordance with reports of commissions and the address of Governor Bullock in 1866, and the general sentiment which then prevailed, the legislature passed an Act regulating in a measure the conditions of the employment of children in manufacturing establishments; and this is one of the first laws of the kind in the United States, although the first legislation in the United States relating to the hours of labour which the writer has been able to find, and for which he can fix a date, was enacted by the state of Pennsylvania in 1849, the law providing that ten hours should be a day's work in cotton, woollen, paper, bagging, silk, and flax factories.

The Massachusetts law of 1866 provided, firstly, that no child under the age of ten years should be employed in any manufacturing establishment, and that no child between the ages of ten and fourteen years should be so employed unless he had attended some public or private school at least six months during the year preceding such employment, and, further, that such employment should not continue unless the child attended school at least six months in each and every year; secondly, a penalty not exceeding \$50 for every owner or agent or other person knowingly employing a child in violation of the Act; thirdly, that no child under the age of fourteen should be employed in any manufacturing establishment more than eight hours in any one day; fourthly, that any parent or guardian allowing or consenting to employment in violation of the Act should forfeit a sum not to exceed \$50 for each offence; fifthly, that the Governor instruct the state constable and his deputies to enforce the provisions of all laws for regulating the employment of children in manufacturing establishments, and to prosecute violations thereof. The same legislature also created a commission of three persons, whose duty it was to investigate the subject of hours of labour in relation to the social, educational, and sanitary condition of the working classes. In 1867 a fundamental law relating to schooling and hours of labour of children employed in manufacturing and mechanical establishments was passed by the Massachusetts legislature. It differed from the Act of the year previous in some respects, going deeper into the general question. It provided that no child under the age of ten years should be employed in any manufacturing or mechanical establishment of the commonwealth, and that no child between the ages of ten and fifteen years should be so employed unless he had attended school, public or private, at least three months during the year next preceding his employment. There were some provisions relating to residence, &c., and a further provision that no time less than 120 half days of actual schooling should be deemed an equivalent of three months, and that no child under the age of fifteen years should be employed in any manufacturing or mechanical establishment more than sixty hours any one week. The law also provided penalties for violation. It repealed the Act of 1866.

Employment of children.

In 1869 began the establishment of that chain of offices in the United States, the principle of which has been adopted by other countries, known as bureaus of statistics of labour, their especial purpose being the collection and dissemination of information relating to all features of industrial employment. As a result of the success of the first bureau, bureaus are in existence in thirty-one states, in addition to the United States Department of Labour.

A special piece of legislation which belongs to the commonwealth of Massachusetts, so far as experience shows, was that in 1872, providing for cheap morning and evening trains for the accommodation of working men living in the vicinity of Boston. Great Britain had long had such trains, which were called parliamentary trains. Under the Massachusetts law some of the railways running out of Boston furnished the accommodation required, and the system has since been in operation.

In different parts of the country the agitation to secure legislation regulating the hours of labour became aggressive again in 1870 and the years immediately following, there being a constant repetition of attempts to secure the enactment of a ten-hours law, but in Massachusetts all the petitions failed till 1874, when the legislature of that commonwealth established the hours of labour at sixty per week not only for children under eighteen years of age, but for women, the law providing that no minor under eighteen years and no woman over that age should be employed by any person, firm, or corporation in any manufacturing establishment more than ten hours in any one day. In 1876 Massachusetts reconstructed its laws relating to the employment of children, although it did not abrogate the principles involved in earlier legislation, while in 1877 the commonwealth passed Factory Acts covering the general provisions of the British laws. The law of 1877 went beyond any previous laws,

Factory legislation, 1877.

which, as shown, related to the employment of women and children so far as hours were concerned. It provided for the general inspection of factories and public buildings, the provisions of the law relating to dangerous machinery, such as belting, shafting, gearing, drums, &c., which the legislature insisted must be securely guarded, and that no machinery other than steam engines should be cleaned while running. The question of ventilation and cleanliness was also attended to. Dangers connected with hoistways, elevators, and well-holes were minimized by their protection by sufficient trap-doors, while fire-escapes were made obligatory on all establishments of three or more storeys in height. All main doors, both inside and outside, of manufacturing establishments, as well as those of churches, school-rooms, town halls, theatres, and every building used for public assemblies, should open outwardly whenever the factory inspectors of the commonwealth deemed it necessary. These provisions remain in the laws of Massachusetts, and other states have found it wise to follow them; but to make such laws of any value to the working people of the country, there needed to be inspectors having the power to examine and recommend, and in many cases to order, the safeguarding of machinery and all the devices used in the factory from which there was any danger.

All the states in the Union where textile factories prevail, except some of the Southern states, have legislation similar to that which has been described for Massachusetts, although not always to such an elaborate extent. Some of the Northern and Middle states, however, have extensive codes of factory laws, the aim of which is to protect the lives and the limbs of the operatives, and to secure healthful, sanitary surroundings. The legislation of different states varies according to the nature of the industries carried on therein. Those where mining predominates and iron-works are found have laws which are especially applicable to such industries. Miners are protected both as to the hours and conditions of their labour. But the attempts to enact laws restricting or fixing the hours of labour of adult males have not been successful as a rule. The state of Utah in its constitution has fixed the day's labour for adults in mining and certain industries. The doctrine that the adult male must

be left at liberty to make his own contracts relative to his working time and his wages has been accepted everywhere as the proper rule. A number of states have laws which fix a day's labour in the absence of any contract, some of them fixing the day at eight hours, so that where an employer and an employé make a contract and do not specify what shall constitute a day's labour, eight hours would be ruled as the day's labour in any action which came before the courts. The United States Government provides by the law of 1868 that eight hours shall constitute a day's work for all labourers, workmen, and mechanics employed by or on behalf of the Government, and by an Act approved 1st August 1892 no officer of the Government can work the employés any longer than that, nor can a contractor having a contract under the Government call for a longer day than eight hours, although under some extraordinary emergency a longer day may be demanded. The day's work has not been fixed in the Southern states, where the textile manufactures have been expanded greatly in the past few years. In those states the day is from eleven to twelve hours, sixty-six hours per week being the prevailing rule. New Jersey has the shortest work-day of any state, fifty-five hours per week; but this regulation is not observed, or at least only in slight degree, outside the silk industry. Sixty hours is the general rule under legislation, although Massachusetts now provides for fifty-eight hours. In addition to the body of laws regulating conditions of employment, there are a great many laws which relate to methods of employment, such as those authorizing fines for damage to goods, but such laws are vexatious and have not been approved, especially by employés.

Law concerning hours.

Some laws relating to the hours of labour have in some states been declared unconstitutional, not because the laws in controversy fixed the length of day, but because they undertook to regulate the labour of a certain class, thereby bringing the laws under the denomination of class legislation. As a rule, however, the courts have generally sustained the laws regulating conditions for the employment of women and children, on the ground that these are the wards of the state.

The second class of laws, those which protect employés from practices tending to prevent them from obtaining or retaining employment, touch broader and deeper principles than those referred to above. The laws themselves are to be found in the statutes of the Federal and state governments, and are directed against such practices. In addition to the laws bearing directly upon this point, action can be taken under them or under the common law by executive and judicial officers for the purpose of enforcing the provisions of the same or causing penalties provided for violations. The statutes themselves may be divided into three classes—those aimed at practices or deeds of employers of labour, those directed against the deeds of employés, and those providing for action to be taken by third parties. While this statement is true as a general proposition, there are, nevertheless, statutes aimed at the punishment of conspiracy and the prevention of intimidation, coercion, boycotting, and blacklisting, which apply to the acts of both employers and employés either by direct language or by inference. Most of the actions of either employers or employés to which these classes of laws apply are the results of labour disputes and their frequent consequences, such as strikes, lockouts, riotings, &c. Probably responsibility could not be fixed in cases of blacklisting under the common law, nor could some features of conspiracy, or what used to be called "unlawful combination," for under the common law at the present time workmen have the right to strike or leave

Intimidation, boycotting, blacklisting, &c.

work either singly or in combination at any time. They may take action for the purpose of improving their condition, and may use peaceful means, such as persuasion, &c., to induce other workmen either to strike or leave their employment or to refrain from accepting employment; but they must not use unlawful means, such as intimidation, force, coercion, &c., the use of such means being regarded as conspiracy. No state has passed any law attempting to change these principles, but some states have re-affirmed these principles by direct statutory provision. Many states have passed laws aimed at the suppression of blacklisting, boycotting, intimidation, coercion, and the use of force by either the employer or employé, and a large number of states have positively forbidden the practice of blacklisting. A few states have passed laws which in direct terms forbid boycotting. The conspiracy laws of a number of the states provide that the combining of two or more persons for the purpose of injuring the business of any other person, or preventing one from obtaining employment, or causing the discharge of any one, are conspiracy and punishable as such. There are many decisions of the highest courts of the states relating to boycotting, but they were made in cases arising under the conspiracy laws or under those laws which, while they do not forbid boycotting in terms, do forbid the use of threats, intimidation, and coercion, which really constitute the illegal features of a boycott. In regard to intimidation, coercion, &c., there are numerous statutes forbidding their use in any efforts made to compel others to do or not to do things which they have a legal right to do or to abstain from doing. It is undoubtedly true that these laws apply in cases of boycotting where intimidation or coercion is used. The writer does not know of any cases which have arisen or been decided in the courts on this particular feature, but the statutes relating to them have frequently been held to apply to employés engaged in strikes, and when attempting to use the boycott and to prevent the employment of new men.

The illegal acts of strikers have been the subject of legislation. When strikes are in progress, especially those of railway employés, many acts are often committed, either by the strikers or their sympathizers, with a view to preventing the employers from using their property and conducting their business. Such acts may be violent, as the destruction or injury of property, cars, buildings, locomotives, &c., or they may apply simply to the abandoning of a locomotive or train without warning. A number of states have passed laws intended to prevent such practices and to provide penalties for the commission of the acts alluded to. The statutes have various terms or provisions, and it is often difficult to make a separation or classification of them. They could all undoubtedly be used in the punishment of those attempting to obstruct the conduct of a business by the use of illegal means. Most of the laws enumerate and forbid the commission of certain deeds, and provide penalties for the violation of their provisions.

Closely connected with the class of legislation now under discussion is that relating to efforts made by employers to have no relations with labour organizations in the conduct of their business, and their endeavour in this connexion not to employ workmen who belong to such associations. Several states have passed laws making such practice on the part of employers unlawful. Many states have enacted laws prohibiting employers from coercing employés, by threats of loss of employment, &c., to vote or not to vote for particular candidates for office or for particular measures, and from discharging employés on account of the way in which their votes have been cast.

The laws relating to apprentices are numerous and voluminous, but, as in England, they do not now have great force, because of the practical abrogation of the apprenticeship system through the operation of the modern methods of production. The number of apprentices who may enter a particular trade has been limited in many cases by the trade unions, but there has been no attempt in the United States, except in one state, to prevent such limitation. The state of Georgia has a law to the effect that if any two or more persons shall associate themselves in any society or organization with intent of preventing, in any manner, any person or persons from apprenticing themselves to learn and practice any trade, &c., they shall, upon conviction, be punished as prescribed by the criminal code.

Liens which a workman may place upon buildings and other constructions on which he has been employed are subject to laws legitimately relating to labour. These laws are numerous and bulky, and every state has them. So, state insolvency laws, and the bankruptcy Acts of the Federal Government require that wages shall be paid in full out of the assets of the bankrupt before a dividend is made to general creditors.

A few states have laws upon their statute-books intended to prohibit the employment of sailors in work upon wharves, &c., thus preventing the ordinary wharf labourers, stevedores, &c., from being supplanted in their ordinary employment.

The laws just treated relate almost entirely to acts either of employers or of employés, but there is another form of law, namely, that providing for action to be taken by others in the effort to prevent workmen from losing employment, either by their own acts or by those of their employers, or to settle any differences which arise out of controversies relating to wages, hours of labour, terms and conditions of employment, rules, &c. These laws provide for the arbitration of labour disputes (see *ARBITRATION AND CONCILIATION*), and many states have provided for the creation of boards of arbitration, before which, by mutual consent, disputes and controversies between employers and employés may be adjusted. At least three states (New York, Massachusetts, and New Jersey) have had considerable experience under this class of legislation, but while, as stated, quite a number of states have laws for such boards, they have not been carried into effect, except in rare instances. The Federal Government, also, has a law providing for conciliation and arbitration in controversies arising between employers and employés where inter-state commerce is involved. No state in the Union has yet provided for compulsory arbitration, although some of the features of the Pennsylvania law and of that of Kansas are construed as providing for compulsory arbitration.

Arbitration.

The enforcement of laws by executive or judicial action is an important matter relating to labour legislation, for without action such laws would remain dead letters. Under the constitutions of the states, the governor is the commander-in-chief of the military forces, and he has the power to order the militia or any part of it into active service in case of insurrection, invasion, tumult, riots, or breaches of the peace or imminent danger thereof. Frequent action has been taken in the case of strikes with the view of preventing or suppressing violence threatened or happening to persons or property, the effect being, however, that the militia protects those working or desiring to work, or the employers. The President of the United States may use the land and naval forces whenever by reason of insurrection, domestic violence, unlawful obstructions, conspiracy, combinations, or assemblages of persons it becomes

The judicial enforcement of labour laws.

impracticable to enforce the laws of the land by the ordinary course of judicial proceedings, or when the execution of the laws is so hindered by reason of such events that any portion or class of the people are deprived thereby of their rights and privileges under the constitution and laws of the country. Under this general power the United States forces have been used for the protection of both employers and employes indirectly, the purpose being, as in the states, to protect mails and to see that the laws are carried out.

The power of the courts to interfere in labour disputes is through the injunction and punishment thereunder for contempt of court. It is a principle of law that when there are interferences, actual or threatened, with property or with rights of a pecuniary nature, and the common or statute law offers no adequate and immediate remedy for the prevention of injury, a court of equity may interpose and issue its order or injunction as to what must or must not be done, a violation of which writ gives the court which issued it the power to punish for contempt. The doctrine is that something is necessary to be done to stop at once the destruction of property and the obstruction of business, and the injunction is immediate in its action. This writ has been resorted to frequently for the indirect protection of employes and employers.

Employers' liability laws, which belong entirely to modern legislation, have been passed for the purpose of enabling an employe to recover damages from his employer under certain conditions when he has been injured through accident occurring in the works of the employer. The common-law maxim that the principal is responsible for the acts of his agent does not apply where two or more persons are working together under the same employer and one of the employes is injured through the carelessness of his fellow-employe, although the one causing the accident is the agent of the principal, who under the common law would be responsible. The old Roman law and the English and American practice under it held that the co-employe was a party to the accident. The injustice of this rule is seen by a single illustration. A weaver in a cotton factory, where there are hundreds of operatives, is injured by the neglect or carelessness of the engineer in charge of the motive power. In such a case, under the common law, the weaver could not recover damages from the employer, because he was the co-employe of the engineer. So, one of thousands of employes of a railway system, sustaining injuries through the carelessness of a switchman whom he never saw, could recover no damages from the railway company, both being co-employes of the same employer. The injustice of this application of the common-law rule has been recognized, but the only way to avoid the difficulty was through specific legislation providing that under such conditions as those just related, and similar ones, the doctrine of co-employment should not apply, and that the workman should have the same right to recover damages as a passenger upon a railway train. This legislation has upset some of the most notable distinctions of law.

The first agitation for legislation of this character occurred in England in 1880. There are now a number of states in the Union which have enacted statutes fixing the liability of employers under certain conditions and relieving the employe from the application of the common-law rule. Of course, where the employe himself is contributory to the injuries resulting from an accident he cannot recover, nor can he recover in some cases where he knows of the danger from the defects of tools or implements employed by him. The legislation upon the subject is exceedingly interesting, and involves many

features of legislation which need not be described here, such as those concerning the power of employes to make a contract, and those defining the conditions, often elaborate, which lead to the liability of the employer and the duties of the employe, and the relations in which damages for injuries sustained in employment may be recovered from the employer.

(C. D. W.)

Labrador, a great peninsula in British North America, bounded on the E. by the North Atlantic, on the N. by Hudson Strait, on the W. by Hudson and James Bays, and on the S. by an arbitrary line extending eastwards from the south-east corner of Hudson Bay, near 51° N., to the mouth of the Moisie river, on the Gulf of St Lawrence, in 50° N., and thence eastwards by the Gulf of St Lawrence. It extends from 50° to 63° N., and from 55° to 80° W., and embraces an approximate area of 511,000 square miles. Recent explorations and surveys have added greatly to the knowledge of this vast region, and have shown that much of the peninsula is not a land of “awful desolation,” but a well-wooded country, containing latent resources of value in its forests, fisheries, and minerals.

Geology.—The peninsula is a very ancient plateau, formed largely of crystalline schists and gneisses associated with granites and other igneous rocks, all of archæan age; there are also large areas of non-fossiliferous, stratified limestones, cherts, shales, and iron ores, the unaltered equivalents of part of the schists and gneisses. Narrow strips of Silurian rocks occur along the low-lying southern and western shores, but there are nowhere else indications of the peninsula having been below sea-level since an exceedingly remote time. During the Glacial period the country was covered by a thick mantle of ice, which flowed out radially from a central collecting-ground. Owing to the extremely long exposure to denudation, to the subsequent removal of the greater part of the decomposed rock by glaciers, and to the unequal weathering of the component rocks, it is now a plateau, which ascends somewhat abruptly within a few miles of the coast-line to heights of between 500 and 2000 feet. The interior is undulating, and traversed by ridges of low, rounded hills, seldom rising more than 500 feet above the surrounding general level.

Physical Geography.—The highest portion of the plateau extends east and west between 52° and 54° N., where an immense granite area lies between the head-waters of the larger rivers of the four principal drainage basins; the lowest area is between Hudson Bay and Ungava Bay in the north-west, where the general level is not more than 500 feet above the sea. The only mountains are the range along the Atlantic coast, extending from the Strait of Belle Isle to Cape Chidley; in their southern half they rarely exceed 1500 feet, but increase in the northern half to a general elevation of upwards of 2000 feet, with numerous sharp peaks between 3000 and 5000 feet. Owing to the exceedingly long period of denudation, the coasts are deeply indented by long irregular bays and fringed with rocky islands, especially along the high

Atlantic coast, where the shore-line is very irregular, and long narrow fiords penetrate inland. Hamilton Inlet, 250 miles north of the Strait of Belle Isle, is the longest of these bays, with a length of 150 miles and a breadth varying from 2 to 30 miles. The surface of the outer portions of the plateau is deeply seamed by valleys, cut into the crystalline rocks by the natural erosion of rivers, depending for their length and depth upon the volume of water flowing through them. The valley of the Hamilton river is the greatest, and forms a continuation of the valley of the Inlet, and extends 300 miles farther inland, while its bottom lies from 500 to 1500 feet below the surface of the plateau into which it is cut. The depressions between the low ridges of the interior are occupied by innumerable lakes, many of great size, including Mistassini, Michikamau, Clearwater, Kaniapiskan, and Seal, all from 50 to 100 miles long. The streams discharging these lakes, before entering their valleys, flow on a level with the country and occupy all depressions, so that they frequently spread out into lake-expansions and are often divided into numerous channels by large islands. The descent into the valleys is usually abrupt, being made by heavy rapids and falls; the Hamilton, from the level interior, in a course of 10 miles falls 900 feet into the head of its valley, this descent including a sheer drop of 315 feet at the Grand Falls, which, taken with the large volume of the river, makes it the greatest fall in North America. The rivers of the northern and western watersheds drain about two-thirds of the peninsula; the most important of the former are the Koksoak, the largest river of Labrador, with a length of over 500 miles, the George, Whale, and Payne rivers, all flowing into Ungava Bay. The large rivers flowing westwards into Hudson Bay are the Povungnituk, Kogaluk, Great Whale, Big, East Main, and Rupert, varying in length from 300 to 500 miles. The rivers flowing south are comparatively short and exceedingly rapid, the Moisie, Romaine, Natashquan, and St Augustine being the most important, and all about 300 miles long. The Atlantic coast range throws most of the drainage northwards into the Ungava basin, and only small streams fall into the ocean, except the Hamilton, North-west, and Kenamou, which empty into the head of Hamilton Inlet.

Climate.—The climate ranges from cold temperate on the southern coasts to arctic on Hudson Strait, and is generally so rigorous that it is very doubtful if the country is fit for agriculture north of 51°, except on the low grounds near the coast. On James Bay good crops of potatoes and other roots are grown at Fort George, 54° N., while about the head of Hamilton Inlet, on the east coast, and in nearly the same latitude, similar crops are easily cultivated. On the outer coasts the climate is more rigorous, being affected by the floating ice borne southwards on the Arctic current. In the interior at Mistassini, 50° 30' N., a crop of potatoes is raised annually, but they rarely mature. No attempts at agriculture have been made elsewhere inland. Owing to the absence of grass plains, there is little likelihood that it will ever be a grazing district. There are only two seasons in the interior: winter begins early in October, with the freezing of the small lakes, and lasts until the middle of June, when the ice on rivers and lakes melts and summer suddenly bursts forth. From unconnected observations the lowest temperatures of the interior range from -50° F. to -60° F., and are slightly higher along the coast. The mean summer temperature of the interior is about 55° F., with frosts during every month in the northern portion. On the Atlantic coast and in Hudson Bay the larger bays freeze solid between the 1st and 15th of December, and

these coasts remain ice-bound until late in June. Hudson Strait is usually sufficiently open for navigation about the 10th of July.

Minerals.—The mineral wealth is quite undeveloped. Thick beds of excellent iron ore cover large areas in the interior and along the shores of Hudson and Ungava Bays. Large areas of mineralized Huronian rocks have also been discovered, similar to areas in other parts of Canada, where they contain valuable deposits of gold, copper, nickel, and lead; good prospects of these metals have been found.

Vegetation.—The southern half is included in the sub-Arctic forest belt, and nine species of trees constitute the whole arborescent flora of this region; these species are the white birch, poplar, aspen, cedar, Banksian pine, white and black spruce, balsam fir, and larch. The forest is continuous over the southern portion to 53° N., the only exceptions being the summits of rocky hills and the outer islands of the Atlantic and Hudson Bay, while the low margins and river valleys contain much valuable timber. To the northward the size and number of barren areas rapidly increase, so that in 55° N. more than half the country is treeless, and two degrees farther north the limit of trees is reached, leaving, to the northward, only barrens covered with low Arctic flowering plants, sedges, and lichens.

Fisheries.—The fisheries along the shores of the Gulf of St Lawrence and of the Atlantic are at present the most valuable resources of Labrador, and form practically the only industry of the white population scattered along the coasts, as well as of a large proportion of the inhabitants of Newfoundland. The census (1891) of Newfoundland gave 10,478 men, 2081 women, and 828 children employed in the Labrador fishery in 861 vessels, of which the tonnage amounted to 33,689 tons; the total catch being 488,788 quintals of cod, 1275 tierces of salmon, and 3828 barrels of herring, which, compared with the customs returns for 1880, showed an increase of cod and decreases of salmon and herring. The salmon fishery along the Atlantic coast is now very small, the decrease being probably due to excessive use of cod-traps on that coast. The cod fishery is now carried on along the entire Atlantic coast and into the eastern part of Ungava Bay, where excellent catches have been made since 1893. The annual value of the fisheries on the Canadian portion of the coast is about \$350,000. The fisheries of Hudson Bay and of the interior are wholly undeveloped, and remain another source of future wealth, as both the bay and the large lakes of the interior are known to be well stocked with several species of excellent fish, including Arctic trout, brook trout, lake trout, white fish, sturgeon, and cod.

Population.—The population is approximately 14,500, or about one person to every 35 square miles; it is made up of 3500 Indians, 2000 Eskimo, and 9000 whites. The last are confined to the coasts and to the few Hudson Bay Company's trading posts of the interior. On the Atlantic coast they are largely immigrants from Newfoundland, together with descendants of English fishermen and Hudson Bay Company's servants. To the north of Hamilton Inlet they are of more or less mixed blood from marriage with Eskimo women. The Newfoundland census of 1901 gave 3634 as the number of permanent white residents along the Atlantic coast, and the Canadian census (1891) gave a white population of 5728, mostly French Canadians, scattered along the north shore of the Gulf of St Lawrence, while the whites living at the inland posts did not exceed fifty persons. As regards the native population of Labrador, it is difficult to give more than a rough approximation of their numbers, owing to their habits of roving from one trading post to another,

and the consequent liability of counting the same family several times if the returns are computed from the books of the various posts, the only available data for an exact enumeration. The following estimate is arrived at in this manner: Indians—west coast, 1200; Ungava Bay, 200; east coast, 200; south coast, 1900. Eskimo—Atlantic coast, 1000; south shore of Hudson Strait, 800; east coast of Hudson Bay, 500. The Indians roam over the southern interior in small bands, their northern limit being determined by that of the trees, on which they depend for fuel. They live wholly by the chase, and their numbers are dependent upon the deer and other animals; as a consequence there is a constant struggle between the Indian and the lower animals for existence, with great slaughter of the latter, followed by periodic famines among the natives, which greatly reduce their numbers and maintain an equilibrium. These famines have occurred several times since the Hudson Bay Company has been established, with the result that the native population has remained about stationary for the last two centuries. The Indians belong to the Algonquin family, and speak dialects of the Cree language. By contact with missionaries and fur-traders they are more or less civilized, and the great majority of them are Christians. Those living north of the St Lawrence are Roman Catholic, while the Indians of the western watershed have been converted by the missionaries of the Church Mission Society; the eastern and northern bands have not yet been reached by the missionaries, and are still pagans. The Eskimo of the Atlantic coast have long been under the guidance of the Moravian missionaries, and are well advanced in civilization; those of Hudson Bay have been taught by the Church Mission Society, and promise well; while the Eskimo of Hudson Strait alone remain without teachers, and are pagans. The Eskimo live along the coasts, only going inland for short periods to hunt the barren-ground caribou for their winter clothing; the rest of the year they remain on the shore or the ice, hunting seals and porpoises, which afford them food, clothing, and fuel. The Christianized Indians and Eskimo read and write in their own language; those under the teaching of the Church Mission Society use a syllabic character, the others make use of the ordinary alphabet.

Political Review.—The Labrador peninsula is divided politically between the Governments of Canada, Newfoundland, and the Province of Quebec. The Government of Newfoundland, under Letters Patent 28th March 1876, exercises jurisdiction along the Atlantic coast; the boundary between its territory and that of Canada is marked by a line running due north and south from Anse Sablon, on the north shore of the Strait of Belle Isle, to 52° N., the remainder of the boundary being as yet undetermined. The northern boundary of the Province of Quebec, as declared by the statutes of Canada, 61 Victoria, cap. 3, follows the East Main river to its source in Patamisk lake, thence by a line due east to the Ashuanipi branch of the Hamilton river; it then follows that river and Hamilton Inlet to the coast area under the jurisdiction of Newfoundland. The remainder of the peninsula, north of the Province of Quebec, by Order in Council 18th December 1897 was constituted Ungava District, an unorganized territory under the jurisdiction of the Government of the Dominion of Canada.

Labuan (more correctly written Labuh-an, its meaning in the Malayan vernacular being "anchorage"), an island of the East Indian or Malayan Archipelago, which has been a British possession since 1848. On 1st January 1890 it was transferred for administrative purposes to the Chartered Company of British North Borneo, the Governor of the Company's territories being from that time forward the governor of Labuan also. As governor of Labuan he holds a commission from the Crown. After its transfer to the Chartered Company the colony still retained its own local laws. The island lies about six miles off the north-western coast of Borneo, opposite the northern end of the great bay of Brunei. Of the total area of 19,347 acres only some 1500 acres are sown with rice, but small tracts of land are covered by cocoanut and sago palms, and about fifty Chinese own vegetable gardens planted on Government ground. The neighbouring island of Pulau Dat is the site of a thriving cocoanut plantation, whence copra and nuts are exported in bulk. The African oil palms have not proved a success. At the time of its occupation a brilliant future was predicted for Labuan: its harbour was to make a second Singapore, and its coal deposits were to prove an unfailing source of wealth. The anticipations made of the wealth of the coal-fields have not been realized; after a succession of companies had liquidated or transferred their leases, the Labuan Borneo Company was formed in 1898, but it has since passed into liquidation. From the coal-mines near the village of Lubok Termiang, some ten miles of metre-gauge railway lead to Victoria Harbour. In 1898 the coal exported amounted to 36,901 tons. The population of Labuan numbered 5731 in 1881, but had decreased to 3361 in 1891. The mainland of Borneo, since its pacification by the Chartered Company, offered greater scope than formerly to native enterprise, and emigration from Labuan consequently ensued. There are about fifty European settlers living in the island, about ten per cent. of whom are women. The native population includes Malay fishermen, Chinese, Tamils, and Kadayans, Tutongs and other natives from the mainland of Borneo. Victoria Harbour is a naval saluting station, and possesses a good rifle-range. The harbour is commodious and well sheltered. The Eastern Extension Telegraph Company have a central station at Labuan, with cables to Singapore, Hong-Kong, and British North Borneo. The colony joined the Imperial Penny Postal Union in 1899. There is one hotel, a Roman Catholic church with a resident priest, a Church of England church which is visited periodically by a clergyman from the mainland, two native and Chinese schools, and a sailors' club built by the R.C. Mission and supported by voluntary contributions. The bishop of Singapore and Sarawak is also bishop of Labuan.

Lace.—The chief incidents in connexion with making lace by hand and by machinery during the years which have elapsed since the article on Lace was written for the earlier volumes (ninth edition) of this work may be said to be (1) increased production, (2) developed ingenuity in the weaving by machinery of a greater variety of lace-like

textures and ornaments than formerly, and (3) improvement in the design of ornament specially destined for translation into lace whether by hand or by machinery.

FIG. 1.—Collar of Irish Crochet Lace.

An extraordinary demand for hand-made laces has led to a revival of this distinctly domestic industry in many parts

FIG. 2.—Lady's Sleeve of Irish Crochet Lace.

of Europe, but particularly in Belgium, where the social and economic conditions are, as they have been in the past,

FIG. 3.—Collar and Bertha of Irish Crochet Lace.

more conducive and more favourable than elsewhere to its pursuit at a sufficiently remunerative rate of wages. The production of hand-made laces in Belgium was in 1900

greater than that of France. The principal needle-made lace of Belgium is the "Point de Gaze"; "Duchesse" and Bruges laces are the chief pillow-made laces; whilst "Point Appliqué" and "Plat Appliqué" are frequently the results not only of combining needle-made and pillow work, but also of using them in conjunction with machine-made net. Ireland is the best producer of that substantial looped-thread work known as crochet, which must be regarded as a hand-made lace fabric. It is in this respect quite distinct in character from pseudo-laces, which are really embroideries with a lace-like appearance, *e.g.*, embroideries on net, cut and embroidered cambrics and fine linen. For such as these Ireland maintains a reputation in its admirable Limerick and Carrickmacross laces, which are made not only in Limerick and Carrickmacross, but also in Kinsale, Newry, Crossmaglen, and elsewhere. The demand from France for Irish crochet is now far beyond the supply, a condition which leads not only to the rapid repetition by Irish workers of old patterns, but tends also to a gradual debasement of both texture and ornament. Attempts have been made occasionally to counteract this tendency, with some success, as the specimens of Irish crochet in Figs. 1, 2, and 3 indicate.

France continues to be faithful to her traditions in maintaining a lively and graceful taste, somewhat, however, at the risk of sacrificing that higher order of hand-work which has supplied the world with the elaborate and delicate needle-point laces of Alençon and Argentan. Fashion of late years has called for ampler and more boldly effective laces, readily produced with both braids and cords and far less intricate needle or pillow work than was required for the dainty and smaller laces of earlier date. Other European countries, including Great

FIG. 4.—Machine-made Trimming Border in imitation of Irish Crochet Lace.

FIG. 5.—Border of Machine-made Lace in imitation of 17th-century Pillow Lace.

Britain, do not compete successfully in hand lace-making with Belgium and France. An appreciable amount of pillow-made lace is annually supplied from Devonshire, Buckinghamshire, Bedfordshire, and Northumberland, but it is bought almost wholly for home and not foreign use. The English laces are made almost entirely in accordance with the precedents of the 19th century—that is to say, in definite lengths and widths, as for borders, insertions, and flounces. The recent demand, however, has been chiefly for large shaped articles, such as panels for dresses, long sleeves, complete skirts, jackets, blouses,

and fancifully-shaped collars of considerable dimensions. To make such things entirely of lace necessitates many modifications in the ordinary methods; the English lace-workers are slow to adapt their work in the manner requisite, and hence are far behind in the race to respond to the fashionable demand. No countries, indeed, succeed

FIG. 6.—Border of Machine-made Lace in the style of 17th-century Pillow Guipure Lace.

so well in promptly answering the variable call of fashion as France and Belgium.

As regards trade in lace, America probably buys more from Belgium than from France; France and England come next as purchasers of nearly equal quantities, after which come Russia and Italy.

In respect of lace-like fabrics made by machinery, British capital and labour are concerned in supplying the world with the more important quantity of curtains and hangings. France seems to take the lead in producing the more filmy and more delicate machine-made laces for wearing purposes; whilst Switzerland (St Gall) and Germany (Plauen in Saxony) are foremost in making by machinery imitations of the more solid laces, such as the Venetian raised or "Rose" needle-point laces and Irish crochet. The technical method of making laces by hand, whether on the pillow with bobbins or in the hand with a needle, has not altered. Plaiting threads on the pillow or looping them together by means of the needle are the same in principle and practice as they were throughout the 16th and 17th centuries, when the fostering and gradual perfection of the art of lace-making were proceeding in Europe.

FIG. 7.—Machine-made Lace in imitation of 16th-century Needle-point "Reti-cella" Lace.

The Leavers lace-making machine, of which the principal features were briefly indicated in the earlier volumes of this Encyclopædia, has not undergone any essential change. Its mechanical principles for weaving the threads together and for rendering variety of ornament in pattern remain as they were, notwithstanding such relatively minor modifications as make it possible to produce readily laces having varied effects such as are shown in the specimens in Figs. 5 and 6. The machine imitations of the lighter and finely-meshed laces, for which the lace-makers at Valenciennes and Mechlin have long been famed, continue to be made in great quantities at Nottingham and

FIG. 8.—Machine-made Lace of Modern Design.

Calais. Within recent years the texture and ornamental design in these fabrics have been so improved that they are worn even by those who not long ago considered hand-made materials to be indispensable. In another branch of lace-making by machinery, mechanical ingenuity, combined with chemical treatment, has led to surprising results (Figs. 4 and 7). Swiss and German manufacturers use machines in which a principle of the sewing-machine is involved. A fine silken tissue is thereby enriched with an elaborately raised cotton or thread embroidery. The whole fabric is then treated with chemical mordants which, whilst dissolving the silky web, do not attack the cotton or thread embroidery. A relief embroidery possessing the appearance of hand-made raised needle-point lace is thus produced. Figs. 8 and 9 give some idea of the high quality to which this admirable counterfeit has been brought.

FIG. 9.—Machine-made Lace in imitation of 17th century Needle-point Lace "Gras point de Venise."

The success with which machinery can compete with the hand in the making of lace must be largely ascribed to the serious study given by those engaged in directing the manufacture by machinery, and to the various ornamental characteristics exhibited in types of hand-made work of former periods. Collections of these exist in museums and technical institutions, as for instance the Victoria and Albert museum in London, the Musée des Arts Décoratifs in Paris, and Museums at Lyons, Nuremberg, Berlin, Turin, and elsewhere. In such places the opportunity is presented of tracing in chronological sequence the stages of pattern and texture development, and thus a means is provided of acquiring a knowledge which has not been obtainable so readily in past times as it is now. This is a condition which gives vitality to both demand and supply.

In addition to books on lace mentioned at the end of the article in vol. xiv. (9th ed.), it will be useful to give here a brief list of other publications. In 1886 the Libraire Renouard, Paris, published a *History of Point d'Ateçon*, written by Madame G. DESPIERRES, which gives a close and interesting account of the industry, together with a list, compiled from local records, of makers and dealers from 1656 onwards.—*Embroidery and Lace: their manufacture and history from the remotest antiquity to the present day*, by ERNEST LEFEBURE, lace-maker and administrator of the Ecole des Arts Décoratifs, translated and enlarged with notes by ALAN S. COLE, was published by H. Grevel, London, 1888. It is a well-illustrated handbook for amateurs, collectors, and general readers.—Irish laces made from selected and recent designs are illustrated in the *Renascence of the Irish Art of Lace-making*, published in 1888 by Chapman and Hall, London.—*Anciennes Dentelles Belges formant la Collection de feu Madame Augusta Baronne Liedts et données au Musée de Grunthuis à Bruges*, published at Antwerp in 1889, consists of a folio volume containing upwards of 181 phototypes—many full size—of fine

specimens of lace. The ascriptions of country and date of origin are occasionally inaccurate, on account of a too obvious desire to credit Bruges with being the birthplace of all sorts of lace work, much of which shown in this work is distinctly Italian.—The *Encyclopædia of Needlework*, by THÉRÈSE DE DILLMONT-DORNACH, Alsace, 1891, is a detailed guide to several kinds of embroidery, knitting, crochet, tatting, netting, and most of the essential stitches for needle-point lace. It is well illustrated with woodcuts and process blocks.—An exhaustive history of Russian lace-making is given in *La Dentelle Russe*, by Madame SORNIÉ DAVIDOFF, published at Leipzig by Karl Hiersemann, 1895. Russian lace is principally pillow-work with rather heavy thread, and upwards of eighty specimens are reproduced by photo-lithography in this book.—A short account of the best-known varieties of *Point and Pillow Lace*, by A. M. S., London, John Murray, 1899, is illustrated with typical specimens of Italian, Flemish, French, and English laces, as well as with magnified details of lace, enabling any one to identify the plaits, the twists, and loops of threads in the actual making of the fabric.—*L'Industrie des Tulles et Dentelles Mécaniques dans le Pas de Calais, 1815-1900*, by HENRI HÉNON (Bélin Frères, Paris, 1900), is an important volume of over 600 pages of letterpress, interspersed with abundant process blocks of the several kinds of machine nets and laces made at Calais since 1815. It opens with a short account of the Arras hand-made laces, the production of which is now almost extinct. The book is sold for the benefit of a public subscription towards the erection of a statue in Calais to Jacquard, the inventor of the well-known apparatus by means of which all figured textile fabrics are manufactured. It is of some interest to note that machine net and lace making at Calais owe their origin to Englishmen, amongst whom "le sieur R. Webster arrivé à St Pierre-les-Calais en Décembre 1816, venant d'Angleterre, est l'un des premiers qui ont établi dans la communauté une fabrique de tulles," &c. *Lace-making in the Midlands: past and present*, is an ably-written little work by C. C. CHANNER and M. E. ROBERTS (Methuen, London, 1900) upon the lace-making industry in Buckinghamshire, Bedfordshire, and Northamptonshire, and contains many illustrations of laces made in these counties from the 17th century to the present time.

(A. S. C.)

Lachine, an incorporated town in Jacques Cartier county, Quebec, Canada, situated eight miles by rail west of Montreal, on Lake St Louis, an expansion of the St Lawrence, and at the upper end of the Lachine canal. It is a station on the Grand Trunk railway and port of call for steamers plying between Montreal and the Great Lakes. It is a favourite summer resort for Montrealers. Population (1881), 2406; (1891), 3761; (1901), 5561.

Laconia, a city of New Hampshire, U.S.A., capital of Belknap county, on the Boston and Maine railroad, and on the west shore of Lake Winnepesaukee. It contains several villages, among them Laconia, Lakeport, and The Wiers. It contains the car-works of the Boston and Maine railroad. Population (1880), 3790; (1890), 6143; (1900), 8042, of whom 1770 were foreign-born and 21 were negroes.

Lacquer (JAPANESE).—No important new developments have taken place during modern times in Japan's lacquer manufacture. Her artists follow the old ways faithfully; and indeed it is not easy to see how they could do better. On the other hand, there has not been any deterioration; all the skill of former days is still active. The contrary has been repeatedly affirmed by foreign critics,¹ but no one really familiar with modern productions can entertain such a view. Lacquer-making, however, being essentially an art and not a mere handicraft, has its eras of great masters and its seasons of inferior execution. Men of the calibre of Kwôetsu Kwôrin, Ritsuô, Kajikawa, and Mitsutoshi must be rare in any age, and the epoch when they flourished is justly remembered with enthusiasm. But the *Meiji* era has had its

¹ Professor Rein, for example, in his great work on Japan, quotes with approval the opinion of a writer who predicts that "it will not be long before the last competent *makiye-shi* [lacquer-decorator] of the country has passed away."

Zeshin, and it has now Shirayama Fukumatsu, Kawanabe Ichô, Shibayama Sôichi, Morishita Morihachi, and other lesser experts, all masters in designing and execution. Zeshin, shortly before he died, indicated Shirayama Fukumatsu as the man upon whom his mantle should descend, and that the judgment of this really great craftsman was correct cannot be denied by any one who has seen the works of Shirayama. He excels in his representations of landscapes and water-scapes, and has succeeded in transferring to gold-lacquer panels tender and delicate pictures of nature's softest moods—pictures that show balance, richness, harmony, and a fine sense of decorative proportion. Kawanabe Ichô is celebrated for his representations of flowers and foliage, and Morishita Morihachi and Asano Saburo (of Kaga) are admirable in all styles,² but especially, perhaps, in the charming variety called *togi-dashi* (ground down), which is pre-eminent for its satin-like texture and for the atmosphere of dreamy softness that pervades the decoration. The *togi-dashi* design, when finely executed, seems to hang suspended in the velvety lacquer or to float under its silky surface. The magnificent sheen and richness of the pure *kin-makiye* (gold lacquer) are wanting, but in their place we have inimitable tenderness and delicacy.

The only branch of the lacquerer's art that can be said to have shown any marked development in the *Meiji* era is that in which parts of the decorative scheme consist of objects in gold, silver, *shakudo*, *shibuichi*, iron, or, above all, ivory or mother-of-pearl. It might indeed be inferred, from some of the essays published in Europe on the subject of Japan's ornamental arts, that this application of ivory and mother-of-pearl held a place of paramount importance. Such is not the case. Cabinets, fire-screens, plaques, and boxes resplendent with gold lacquer grounds carrying elaborate and profuse decoration of ivory and mother-of-pearl³ are not objects that appeal to Japanese taste. They belong essentially to the catalogue of articles called into existence to meet the demand of the foreign market, being, in fact, an attempt to adapt the lacquerer's art to decorative furniture for European houses. On the whole it is a successful attempt. The plumage of gorgeously-hued birds—as peacocks, parroquets, pheasants, &c.—the blossoms of flowers (especially the hydrangea), the folds of thick brocade, microscopic diapers and arabesques, are built up with tiny fragments of iridescent shell, in combination with silver foil, gold lacquer, and coloured bone, the whole producing a rich and sparkling effect. In fine specimens the workmanship is extraordinarily minute, and every fragment of metal, shell, ivory, or bone, used to construct the decorative scheme, is imbedded firmly in its place. But in a majority of cases the work of building is done by means of paste and glue only, so that the result lacks durability. The employment of mother-of-pearl to ornament lacquer-grounds dates from a period as remote as the 8th century, but its use as a material for constructing decorative designs began in the 17th century, and was due to an expert called

New
develop-
ment.

² A large part of the work of lacquer-making is purely technical, namely, the part done by the *nurimono-shi*, who spreads the numerous coats of lacquer and performs the various processes of polishing and grinding. By him is produced what may be called "artisan lacquer"; that is to say, all varieties of lacquer that owe their beauties solely to quality and colour of surface, namely, monochromes, as mirror-black, vermilion, yellow, brown, green, cinnabar and other hues of red; grounds ornamented with a dust of gold, silver, mother-of-pearl, tin, or bronze; grounds inlaid with mother-of-pearl; marbled, wood-grained, and so forth. "Art lacquer," on the other hand, is that which, after emerging from the hands of the *nurimono-shi*, passes under those of the *makiye-shi*, who, briefly speaking, paints upon the surface of the lacquer a picture, whether of a landscape, a battle-scene, flowers, foliage, birds, insects, &c., or some more formal decoration of scrolls, arabesques, and diapers. The *makiye-shi* is a true artist.

³ Obtained from the shell of the haliotis.

Shibayama, whose descendant, Shibayama Sôichi, now works in Tôkyô.

The following account of the history of the lacquer industry in Japan and the processes of manufacture is taken from the writer's *Japan*. Japan derived the art of lacquering from China (probably about the beginning of the 6th century), but she ultimately carried it far beyond Chinese conception. At first her experts confined themselves to plain black lacquer. From the beginning of the 8th century they began to ornament it with dust of gold or mother-of-pearl, and throughout the *Heian* epoch (9th to 12th century) they added pictorial designs, though of a formal character, the chief motives being floral subjects, arabesques, and scrolls. All this work was in the style known as *hira-makiye* (flat decoration); that is to say, having the decorative design in the same plane as the ground. In the days of the great dilettante Yoshimasa (1449-90), lacquer experts devised a new style, *taka-makiye*, or decoration in relief, which immensely augmented the beauty of the ware, and constituted a feature altogether special to Japan. Thus when, at the close of the 16th century, the *Taikhô* inaugurated the fashion of lavishing all the resources of applied art on the interior decoration of castles and temples, the services of the lacquerer were employed to an extent hitherto unknown, and there resulted some magnificent work on friezes, coffered ceilings, door panels, altar-pieces, and cenotaphs. This new departure reached its climax in the Tokugawa mausolea of Yedo and Nikko, which are enriched by the possession of the most splendid applications of lacquer decoration the world has ever seen, nor is it likely that anything of comparable beauty and grandeur will be again produced in the same line. Japanese connoisseurs name the end of the 17th century as the golden period of the art, and so deeply rooted is this belief that whenever a date has to be assigned to any specimen of exceptionally fine quality, it is unhesitatingly referred to the time of Jôken-in (Tsunayoshi). It will thus be perceived that the three great stages in the history of lacquer industry were separated by intervals of 100 years; namely, the Yoshimasa development at the end of the 15th century, the *Taikhô* development at the end of the 16th, and the *Jôken-in* climax at the end of the 17th. Beyond the last it is difficult to perceive any possibility of advance.

In the manufacture of Japanese lacquer there are three processes. The first is the extraction and preparation of the lac; the second, its application; and the third, the decoration of the lacquered surface. The lac, when taken from an incision in the trunk of the *Rhus vernicifera* (*urushi-no-ki*), contains approximately 70 per cent. of lac acid, 4 per cent. of gum arabic, 2 per cent. of albumen, and 24 per cent. of water. It is strained, deprived of its moisture, and receives an admixture of gamboge, cinnabar, acetous protoxide, or some other colouring matter. The object to be lacquered, which is generally made of thin white pine, is subjected to singularly thorough and painstaking treatment, one of the processes being to cover it with a layer of Japanese paper or thin hempen cloth, which is fixed by means of a pulp of rice-paste and lacquer. In this way the danger of warping is averted, and exudations from the wooden surface are prevented from reaching the overlaid coats of lacquer. There are numerous operations of luting, sizing, lacquering, polishing, drying, rubbing down, and so on, until, after many days' treatment, the object emerges with a smooth, lustre-like, dark-gray surface, and is ready to pass into the hands of the *makiye-shi*, or decorator. The latter is an artist; those who have performed the preliminary operations are merely skilled artisans. The *makiye-shi* may be said to paint a picture on the surface of the already lacquered object. He takes for subject a landscape, a seascape, a battle-scene, flowers, foliage, birds, fishes, insects—in short, anything. This he sketches in outline with a paste of white lead, and then, having filled in the details with gold and colours, he superposes a coat of translucent lacquer, which is finally subjected to careful polishing. If parts of the design are to be in relief, they are built up with a putty of black lacquer, white lead, camphor, and lamp-black. In all fine lacquers gold predominates so largely that the general impression conveyed by the object is one of glow and richness. It is also an inviolable rule that every part must show beautiful and highly finished work, whether it be an external or an internal part. The *makiye-shi* ranks almost as high as the pictorial artist in Japanese esteem. He frequently signs his works, and it results that a great number of names have been handed down during the past two centuries.

See also under JAPAN.

(F. BY.)

Lacroma, a small island of the Austrian province of Dalmatia, south of Ragusa, remarkable for the beauty of its sub-tropical vegetation. It was a favourite resort of the Archduke Maximilian, afterwards emperor of Mexico, who restored the chateau and park, and of the Crown Prince Rudolph. It contains an old monastery,

and the remains of a church said to have been founded by Richard Cœur de Lion now form part of the imperial chateau.

See *Lacroma*, an illustrated descriptive work by the Crown Princess Stephanie (Vienna, 1892).

Lacrosse, a city of Wisconsin, U.S.A., capital of Lacrosse county, on the east bank of the Mississippi river, at the mouths of the Lacrosse and the Black, at an altitude of 669 feet. Its plan is regular, and it has a good water-supply, owned by the city. It is on four railways: the Chicago, Burlington, and Quincy; the Chicago and North-Western; the Chicago, Milwaukee, and St Paul; and the Green Bay and Western. Its chief business in the manufacture of lumber. Its manufactures, according to the census of 1890, had a capital of \$10,039,872, employed 4127 hands, and had a product valued at \$9,157,501. Lumber was the principal product, with a value of \$3,570,522, and next in value was flour, with \$2,134,785. The assessed valuation of property, real and personal, was \$12,381,952, the net debt of the city was but \$401,029, and the rate of taxation \$22.50 per \$1000. Population (1890), 25,090; (1895), 28,769; (1900), 28,895, of whom 7222 were foreign-born and 56 were negroes.

Ladak.—Little has occurred in this remote outlying province of the upper Indus to bring it into prominence of late years. It is from Leh, its capital, that western Tibet is most readily accessible, and through Leh the trade of Lhasa ebbs and flows. It is this trade which gives Ladak sufficient local importance to justify the presence of a British political officer, who resides at Leh for half the year; whilst its geographical position renders it further notable as the starting-point of many adventurous journeys into the Tibetan highlands. As year by year the economic possibilities which lie beyond the Himalaya become better known, it is more clearly demonstrated that no great trade developments are to be expected from these Tibetan sources which have already been tested, so long as the spirit of determined opposition to the advance of European influence, and to the introduction of scientific methods, is maintained amongst Tibetan officials. With the gradual awakening of China there may hereafter be reflected some rays of enlightenment into these far-away borders of the "Celestial Empire," but at present there is more evidence of a decrease in Tibetan trade than of progress.

In 1896-97 the exports to British India from Tibet, chiefly passing through Leh, amounted to Rx.140,456, showing an increase on the previous year, but a decrease of Rx.5000 on the year before. The imports were Rx.69,406, which is lower than the two previous years. Ladak is, however, improving in its trade prospects apart from Tibet; and in 1896-97 the exports amounted to Rx.57,508, and imports to Rx.64,574. It is curious that both Ladak and Tibet import a considerable amount of treasure, for on the borders of western Tibet and within a radius of one or two hundred miles of Leh there centres a gold-mining industry which apparently only requires scientific development to render it enormously productive. Here the surface soil has been washed for gold, for more centuries than we can count, by bands of Tibetan miners who never work deeper into the soil than from 20 to 50 feet, and whose methods of washing have ever been of the very crudest description. They work in winter, chiefly because of the binding power of frost on the friable soil, suffering great hardships and obtaining but a poor return for their labour. But the remoteness of Ladak and its extreme altitude still continue to bar the way to substantial progress, though its central position naturally entitles it to be the great trade mart.

The road to Leh from Srinagar lies up the lovely Sind valley to the sources of the river at the Zoji La pass

(11,300 feet) in the Zaskar range. This is the range which, skirting the southern edge of the upland plains of Deosai in Baltistan, divides them from the valley of Kashmir, and then continues to Nanga Parbat (26,620 feet) and beyond that mountain, to the north of Swat and Bajor. To the south-east it stretches in an unbroken chain till it merges into the line of snowy peaks which is seen from Simla and the plains of India—the snowy range which reaches past Chini to the famous peaks of Gangotri, Nandadevi, and Nampa. It is the most central and the best known range in the Himalaya. The Zoji La, which curves from the head of the Sind valley on to the bleak uplands of Dras (where lies the road to the trough of the Indus and Leh), is, in spite of its altitude, a pan in which but little snow lies; but for local accumulations, it would be open all the year round. It is cited by Oldham, of the Indian Geological Survey, as affording a typical instance of that cutting-back process by which a river-head may erode a channel through a watershed and cut into the plateau behind, there being no steep fall towards the Indus on the northern side of the range. From the Zoji La the road continues by easy gradients, following the line of the Dras drainage, to the Indus, when it turns up the valley to Leh. From Leh there are many routes into Tibet, the best known being that which comes from the Indus valley to the Tibetan plateau, by the Chang La, to Lake Pangkong and Rudok (14,000 feet). Rudok occupies a forward position on the western Tibetan border which is analogous to that of Leh in Kashmir. The chief trade route to Lhasa from Leh, however, follows the line offered by the valleys of the Indus and the Brahmaputra (or Tsanpo), crossing the divide between these rivers north of Lake Manasarowar. The development of trade through Ladak depends on the maintenance of this road, which is at present absolutely closed to Europeans.

The observatory at Leh is the most elevated observatory in Asia. According to Mr Blandford's work on the climate and weather of India, it is situated 4° farther north than Quetta, and 6,000 feet higher, and "in the leading characteristics of its climate represents that of western Tibet. . . . The atmosphere of the Indus valley is remarkably clear and transparent, and the heat of the sun is very great. There is generally a difference of more than 60° between the reading of the exposed sun thermometer *in vacuo* and the air temperature in the shade, and this difference has occasionally exceeded 90°. . . . The mean annual temperature at Leh is 40°, that of the coldest months (January and February) only 18° and 19°, but it rises rapidly from February to July, in which month it reaches 62° with a mean diurnal maximum of 80° both in that month and August, and an average difference of 29° or 30° between the early morning and afternoon. The mean highest temperature of the year is 90°, varying between 84° and 93° in the twelve years previous to 1893. On the other hand, in the winter the minimum thermometer falls occasionally below 0°, and in 1878 reached as low as 17° below zero. The extreme range of recorded temperature is therefore not less than 110°. The air is as dry as Quetta, and rather more uniformly so. . . . The amount of rain and snow is insignificant. The average rain (and snow) fall is only 2.7 inches in the year, and since that amount is the greatest ever recorded in any one year, and as rain is most frequent in July and August—but even then it only occurs on one day in ten—and the average fall of each rainy day is between one-tenth and two-tenths of an inch, agriculture is therefore almost entirely dependent on irrigation. The winds are generally light, and depend on the local direction of the valleys. At Leh, which stands at the entrance of the valley leading to the Khardong Pass, the most common directions are between south and west

in the daytime and summer, and from north-east in the night, especially in the later months of the year. In January and February the air is generally calm, and April and May are the most windy months of the year."

Leh has been repeatedly visited since 1880 by travellers bound on Tibetan exploration, including Bower, Wellby, Littledale, Deasy, and others, who have recorded their general impressions, but left little description of districts on the Indian side of the Tibetan border.

The following should be consulted:—**GODWIN-AUSTEN**. "The Mountain Systems of the Himalaya," vol. vi. *Proc. R.G.S.*, 1884. —**W. LAWRENCE**. *The Valley of Kashmir*. London, 1895.—**H. F. BLANDFORD**. *The Climate and Weather of India*. London, 1889. (T. H. H*.)

Ladrones, or **MARIANNES**, an archipelago in the North Pacific, in about 15°–20° N. and 142° E. It consists of two groups—a northern of ten volcanic islands, of which only four (Agrigan, Anatahan, Alamagan, and Pagan) are inhabited, and a southern of five (Rota, Guam, Aguigan, Tinian, and Saypan) coralline limestone islands, all inhabited save one, Aguigan. The entire archipelago, except the island of Guam, together with the Caroline and Pelew Islands, was sold by Spain to Germany for £837,500 in 1899. The total area is about 220 square miles, and the population 1950, mostly descendants of Tagal immigrants from the Philippines. Coconut and areca palms, yams, sweet potatoes, manioc, coffee, cocoa, sugar, cotton, tobacco, and mother-of-pearl are the chief products, and copra the principal export. Administratively the archipelago forms part of the New Guinea Protectorate.

Lafayette, a city of Indiana, U.S.A., capital of Tippecanoe county, on the east bank of the Wabash river, at an altitude of 542 feet. It is well laid out, and is divided into seven wards. Its water-supply is pumped from the Wabash. It is on four railways: the Chicago, Indianapolis, and Louisville; the Cleveland, Cincinnati, Chicago, and St Louis; the Lake Erie and Western; and the Wabash. It is the seat of Purdue University, a technical school, founded in 1874, which had, in 1899, 64 professors and instructors and was attended by 749 students, 91 of whom were women. Population (1890), 16,243; (1900), 18,116, of whom 2266 were foreign-born and 344 negroes.

Laffitte, Pierre (1823—), French Positivist, was born 21st February 1823 at Béguey (Gironde). Residing in Paris as a teacher of mathematics, he became a disciple of Comte, and was one of his testamentary executors. On the schism of the Positivist body, which followed the master's death, he was recognized as head of the section which accepted the full Comtian doctrine; the other section adhering to Littré, who rejected the Religion of Humanity as inconsistent with the materialism of Comte's earlier period. In 1875 Laffitte published *Les grands types de l'humanité*, and *Cours de philosophie première* (1889). Owing to advanced years he afterwards resigned the active direction of Positivist affairs.

Lagarde, Paul Anton de (1827–1891), German theologian and orientalist, was born at Berlin on the 2nd of November 1827, and educated there. At Berlin, and afterwards at Halle, he studied theology and philosophy, as well as Oriental languages. In 1852 his studies took him to London and Paris. On his return to Germany in 1854 he obtained the post of teacher at a Berlin public school, but at the same time carried on his Biblical studies. He edited the Syriac "*Didascalia Apostolorum*," and followed this up with other Syriac texts collected in the British Museum and in Paris. Lagarde kept this post till 1866, when he received three years'

leave of absence with a view to collecting fresh materials for his labours. On his return in 1869 he was called to Göttingen to the professorship previously held by Ewald. Like him, Lagarde was an active worker in a great variety of subjects and languages; but his chief aim, the elucidation of the Bible, was almost always kept in view. He edited the Aramaic translation (known as "Targum") of the Prophets according to the Codex Reuchlinianus preserved in the library at Karlsruhe, the Hagiographa Chaldaica, an Arabic translation of the Gospels, a Syriac translation of the Old Testament Apocrypha, a Coptic translation of the Pentateuch, and a part of the Lucianic text of the Septuagint, which he was able to reconstruct from manuscripts for nearly half the Old Testament. Besides his Biblical studies, he devoted himself ardently to Oriental scholarship. In 1877 he engaged in Armenian investigations; in 1883 he took up Persian, and also published his "Ægyptiaca," which deals with Coptic studies. His minor articles were collected under the titles "Symmicta" and "Mitteilungen," as well as in volumes issued by the University of Göttingen. Lagarde also took some part in politics. He belonged to the Prussian Conservative party, and was a violent anti-Semite. The bitterness which he showed in this racial question also made itself felt in his other writings, and in his differences with other scholars he showed some of that polemic acrimony which prevails in learned circles in Germany. He died at Göttingen on the 22nd of December 1891.

(A. Z.)

Lagos, a British colony in West Africa, bounded roughly on the N. by Ilorin, on the E. by Benin (both forming part of Nigeria), on the S. by the Bight of Benin, and on the W. by Dahomey. It was, by a charter dated 13th January 1886, separated from the Gold Coast Colony and erected into a separate colony, the government of which is conducted by a governor assisted by executive and legislative councils nominated by the Crown. In the legislative council there are four unofficial members, two of whom are natives of the country. The colony proper begins on the coast, on the west side, at the boundary of the French protectorate of Dahomey, on the meridian of Ajara Creek, at about 2° 45' 50" E., and extends on the east side to Ode, at about 4° 30' E. Connected with the colony is an administrative protectorate, within which the courts of the colony have jurisdiction. The colony proper and this protectorate together make up an area of some 1500 square miles. The political protectorate connected with Lagos meets southern Nigeria at Ogbo on the coast, about 4° 49' E. It includes the Idanre country, but excludes Ilorin. On the west it follows generally the meridian of the Ajara watercourse as far north as the neighbourhood of 9° N., in the vicinity of which it passes eastwards, so as to include all Yoruba settlements on the Lagos side of the boundary. The jurisdiction of the supreme court has not been extended to the political protectorate, but a general directing control is maintained there by the commissioners who preserve the public peace and influence and assist native authorities. The population of Lagos, the largest town on the African west coast, is about 33,000, of whom about 300 are Europeans. The largest towns in the protectorate are Abeokuta and Ibadan, estimated to have populations of about 150,000 and 200,000 respectively, but there has been no census. The population of the colony and protectorate may be altogether upwards of two millions. The total superficial area of the colony and all its dependencies is set down at 27,000 square miles. The supreme court has jurisdiction in the administrative protectorate as well as in the colony. The native authorities have, save in the case of some graver crimes, a concurrent

jurisdiction which is exercised in this protectorate. In the political protectorate the laws are administered in the name of the native authorities. The great majority of the civil servants are natives of the country, some of whom have been educated in the colony, others in England and elsewhere. The European officers number generally about 112; the native officers about 259. Mails are received weekly from Europe, but with some irregularity, as there is no subsidized service. There is cable communication with Europe. The British and West African Bank was opened in Lagos on the 1st of April 1891. There is also a Government savings bank. The amount of the deposits is £16,553. The police establishment embraces a force of upwards of 350 men. The police is an armed and partially drilled body. There is a Hausa constabulary of about 800 men. These are trained as infantry and artillery by 18 European and 3 native commissioned officers. About 300 men are generally stationed at Lagos, 150 at Ibadan, 50 at Shaki, and others in small detachments elsewhere. The legal status of slavery is not recognized by the courts, and dealing in slaves is suppressed. As an institution slavery is steadily dying out, and will soon become extinct, unless in some veiled domestic form.

Lagos Town.—The principal buildings in the town of Lagos are a large and sumptuous government house; the Glover Memorial Hall, used for public meetings and entertainments; an elaborate club, provided from public funds; police quarters, and many substantial villas that serve as quarters for the officers of the civil service. There are many solidly-built, handsome private buildings. Regular streets are laid out over about half the town only. Owing to the complete absence of stone, the streets are not macadamized. The chief stores and depots for goods are all on the banks of the lagoon. Merchandise is generally transported by water. An electric tramway is projected, to traverse the town and connect with the railway on the mainland. A considerable portion of the town is supplied with the electric light, which is being extended. Only surface drainage has been attempted. Underground draining is difficult, on account of the low and level nature of the ground. There still exists a large acreage of swamp land in and near the town of Lagos, and costly and persevering efforts are being made to reclaim these swamps. Till this is done it is not likely that Lagos can become even tolerably healthy. The water-supply is derived in many cases from rain-water collected from the iron roofs of houses and stored in tanks, but more generally from wells sunk in the sandy soil on which the town is built. The number of houses covered by galvanized iron is steadily increasing, and now exceeds 5000. There is a dry-earth system of sewerage. No form of municipality has been established. Its inhabitants have always regarded any proposal in that direction with disfavour. The commodious public hospital, of the cottage type, on a good site, with proper accommodation for 10 European and 46 native patients, has European nurses in charge and a resident medical officer. The number of resident patients treated in 1899 was—Europeans 77, others 694; out-patients 4294. There is a good racecourse, which also serves as a general public recreation ground. The port is accessible only to vessels drawing about 10 feet of water, on account of shifting banks of sand that form a bar at the sea entrance of the lagoon. Large ocean-going steamers anchor outside the bar, not less than a couple of miles from land, and goods and passengers are there transhipped into smaller branch steamers for Lagos. Heavy cargo is taken on by the large steamers to Forcados and transhipped there into the branch boats for Lagos. It has been estimated that it would cost a million sterling to open the harbour permanently to large steamers.

Communications.—A solidly constructed railway on a 3-feet gauge starts from Iddo Island, and extends past Abeokuta, which is some 60 miles from Lagos, to Ibadan, a total distance of 122 miles. The railway (opened in 1901) crosses from Ebute Metta on the mainland to Iddo Island by the Denton Bridge, a handsome structure of iron 917 feet long. The Carter Bridge, also of iron, 2111 feet long, connects Iddo Island with the town of Lagos. The railway was built by the Government, and cost nearly a million sterling. The lagoon, which lies in a direction generally parallel to the sea, and only a very few miles from it, is entirely free of coral, and contains hardly any rocks of any kind, though it is often shallow and has many mud-banks in its bed. It, however, offers very convenient channels for numerous small craft, which, with the exception of steam-launches, are almost entirely native-built canoes. Branch steamers run between Lagos and Porto Novo.

During the last few years some miles of road have been made by the Government at an expense of nearly £40,000.

Industry.—No minerals are known with certainty to exist in the colony. The inhabitants are chiefly engaged in agriculture and trading. The principal articles of cultivation are yams, cassava, maize, sweet potatoes, sesame, millet, beans, sugar-cane, and cotton, all original products of the country. To these are being added coffee, cocoa, rubber trees, &c. Model farms are being established for the purposes of experimental culture and for the tuition of the natives. The soil is generally fertile, though as a rule containing a considerable proportion of sand. A few land concessions have been taken up by Europeans on long leases. The native owners profess to be unable to alienate land in perpetuity, but native custom does not preclude leasing. Some of the concessions are only for cutting and removing timber, others permit of cultivation.

Climate.—The rainfall has not been ascertained in the interior. In the northern districts it is probably considerably less than at Lagos, where it is about 70 inches a year. The mean temperature at Lagos is 82°·5 F. At certain seasons sudden heavy squalls of wind and rain that last for a few hours are common. The hurricane and typhoon are unknown. The climate is not a healthy one, especially for Europeans. The sanitary condition of all towns, including Lagos itself, is bad. The principal diseases are malarial fever, smallpox, rheumatism, peripheral neuritis, dysentery, chest diseases, and guinea-worm. Fever not unfrequently assumes the dangerous form known as "black-water fever." The frequency of smallpox is being much diminished outside of the larger towns in the interior, in which, owing to the absence of an organized government, vaccination is neglected. The number of persons vaccinated by the medical department in 1899 was 65,073. A contagious diseases hospital is used for the reception of patients suffering from smallpox, &c. There is a leper asylum, lunatic asylum, and a laboratory for chemical and pathological study. The absence of plague, yellow fever, cholera, typhoid fever, and scarlatina is noteworthy. Yaws of a mild form is endemic.

Education.—The Government expends directly about £6000 on education annually. Grants are made on examination results as determined by the inspector of schools to seventeen Church of England schools, ten Wesleyan, and ten Roman Catholic schools. Grants are also given to schools for the elementary education of Mahomedans in the form of payment for their teachers (seven in number). Contributions are also made to technical education. Lagos is a centre for the examinations for degrees in arts and laws of the University of London.

Religion.—The different Christian denominations claim 6700 members, namely: Church of England 2700, Wesleyans 1800, Roman Catholics 1800, Baptists 400. The Mahomedans number about 21,000, which leaves some 50,000 pagans. In some parts of the country Mahomedanism is gaining ground, but it is not of a rigid type.

Finance.—The revenue is chiefly derived from customs, which yield nearly eleven-twelfths of the whole. Over three-fourths of the duties is paid on spirits. The revenue for 1890 was £56,340; for 1895, £142,049; for 1900-01, £211,467; and the expenditure for 1890 was £63,600; for 1895, £144,483; for 1900-01, £187,125.

Trade.—The import and export trade is chiefly in the hands of British and German merchants. In 1899 imports by British merchants amounted in round numbers to £878,892; by German merchants to £78,623. Exports by British merchants were valued at £577,902; by German merchants at £338,032. In 1890 the imports were valued at £464,260, and the exports at £457,649; in 1895 these were £815,815 and £985,595; in 1899 £957,515 and £915,934; and in 1900-01, £806,529 and £831,258.

The principal articles of export for the years 1889 and 1899 were as follows:—

Articles.	1889.	1899.
Palm oil and kernels	£373,710	£581,275
Timber	34,738
Rubber	160,313
Coffee	139
Cocoa	70	3,411
Copra	3	296
Gum	1,135	507
Ivory	4,093	870
Shea—butter	1,393	5,323
Other articles	77,245	129,062
	£457,649	£915,934

(W. M'G.)

Laguna, a town of the Canary Islands (Spanish), on the island of Tenerife. The population in 1897 was 11,987. It is the seat of a coadjutor bishop of Seville. The soil of the surrounding country is fertile, and yields

wheat, wine, oranges, raisins, tobacco, and other products of agriculture. The town has two large squares, regular and broad streets, a fine modern town hall, hospitals, a public library of 20,000 volumes, an institute, and several schools. There are three churches besides the cathedral, and several handsome residences of the nobility.

Lahn, a river of Prussia, in the Rhine province and province of Hesse-Nassau, rising in the extreme south of the province of Westphalia east of Siegen, at an altitude of 2210 feet. It flows at first east as far as Kölbe, then south past Marburg to Giessen, where it turns to the west-south-west, and continues past Wetzlar, Limburg, Ems, and Niederlahnstein, and enters the Rhine from the right after a course of 135 miles. Its valley is in parts very narrow, and full of picturesque charm.

Lahore, a city of British India, the capital of the Punjab, giving its name to a district and a division. It is situated near the left bank of the river Ravi, 1706 feet above the sea; 1160 miles by rail north-west of Calcutta, and 290 miles south-east of Peshawar. Population (1881), 149,369; (1891), 176,854; (1901), 120,058. The municipal income in 1897-98 was Rs.4,52,652; death-rate (1897), 29 per 1000. The native town is still surrounded by a brick wall 16 feet high, with thirteen gates and a citadel. To the south lies the suburb of Anarkalli, and eastward of this stretches the European quarter known as Donald Town (after Sir Donald Macleod), with Government House and the Lawrence Gardens. Still farther east, separated by a branch of the Bari Doab canal, is the cantonment of Mian Mir, which has accommodation for all arms. It is an important junction on the North-Western railway system, but without much trade or manufacture. The chief industries are silk goods, gold and silver lace, and metal work. A cotton-mill was opened in 1897. There are a flour-mill, an ice factory, and several factories for mineral waters. It is the headquarters of the Punjab University, which not only conducts examinations, but also manages the Oriental College, with 70 students in 1896-97. In addition, there are four arts colleges: one maintained by Government, with 246 students; the Dayanand Anglo-Vedic College, with 383 students; the Forman Christian College, with 270 students; and the Islamiya College, with 48 students. The other educational institutions include the Medical College, with 238 students; the Law School, with 433 students; the Veterinary College, with 82 students; the Mayo School of Art—perhaps the most successful of its kind in India—with 196 students; the Central Training College, with 82 students; the Aitchison College, for the training of the sons of native noblemen, on the model of an English public school, with 60 boys; 11 high schools, including one for European boys; and a railway technical school, with 183 boys. There are 67 printing-presses, issuing 34 newspapers, of which the best known is *The Civil and Military Gazette*. The public library and reading-room receives Rs.2666 from Government; and there are numerous religious institutions, Hindu, Sikh, and Mahomedan, which are active in diffusing education and literature.

The district of LAHORE has an area of 3678 miles; population (1881), 924,106; (1891), 1,075,379, showing an increase of 16 per cent., due to the extension of irrigation; average density, 292 persons per square mile. In 1901 the population was 1,156,548, showing a further increase of 8 per cent. The land revenue and rates were in 1897-98 Rs.10,14,852. the incidence of assessment being Rs.0:8:5 per acre; cultivated area, 802,853 acres, of which 696,141 were irrigated, including 403,000 from Government canals; number of police, 1404; number of schools (1896-97), 267, attended by 13,123 boys, being 14 per cent. of the

boys of school-going age; death-rate (1897), 26·8 per thousand. The principal crops are wheat, pulse, millet, maize, oil-seeds, and cotton. There are about 20 factories for ginning and pressing cotton. Irrigation is provided by the main line of the Bari Doab canal and its branches, and also by inundation-cuts from the Sutlej. The district is crossed in several directions by lines of the North-Western railway, 127 miles. Some local distress was caused by drought in 1896-97.

The division of LAHORE extends along the right bank of the Sutlej, from the Himalaya to Mooltan. It comprises the six districts of Mooltan, Jhang, Montgomery, Lahore, Amritsar, and Gurdaspur. Total area, 24,872 square miles; population (1891), 4,579,794.

Laibach, the capital of the Austrian Duchy of Carniola, on the Laibach, 40 miles south by east of Klagenfurt. The garrison, comprising infantry and artillery, numbers 2592 men. Since the severe earthquake of April 1895, which destroyed part of the town, the old castle, which was used as a prison, is only inhabited by a caretaker. The municipal administration is purely Slovenian, and the Slovenian language is in general official use. A subsidized Slovene theatre is maintained, and there are also societies for the promotion of science and literature in the native tongue. The industries now include manufactures of pottery, bricks, lucifer matches, &c. Population (1890), 31,663; (1900), 36,547.

Laing, Samuel (1810-1897), British author and railway administrator, was born at Edinburgh, 12th December 1810. He was the nephew of Malcolm Laing (*Ency. Brit.* xiv. 216), the historian of Scotland, and his father, Samuel Laing (1780-1868), was also a well-known author, whose books on Norway and Sweden attracted much attention in the 'forties and 'fifties. Samuel Laing the younger entered St John's College, Cambridge, in 1827, and after graduating as second wrangler and Smith's prizeman, was elected a fellow, and remained at Cambridge temporarily as a coach. He was called to the bar in 1837, and became private secretary to Mr Labouchere (afterwards Lord Taunton) the President of the Board of Trade. In 1842 he was made secretary to the railway department, and retained this post till 1847. He had by then become an authority on railway working, and had been a member of the Dalhousie Railway Commission; it was at his suggestion that the "parliamentary" rate of a penny a mile was instituted. In 1848 he was appointed chairman and managing director of the London, Brighton, and South Coast railway, and his business faculty soon showed itself in the largely increased prosperity of the line. He also became chairman (1852) of the Crystal Palace Company, but retired from both posts in 1855. In 1852 he entered Parliament as a Liberal for Wick, and after losing his seat in 1857, was re-elected in 1859, in which year he was appointed financial secretary to the Treasury; in 1860 he was made Finance Minister in India. On returning from India, he was re-elected to Parliament for Wick in 1865. He was defeated in 1868, but in 1873 he was returned for Orkney and Shetland, and retained his seat till 1885. Meanwhile he had been reappointed chairman of the Brighton line in 1867, and continued in that post till 1894, being generally recognized as an admirable administrator. He was also chairman of the Railway Debenture Trust and the Railway Share Trust. In later life he became well known as an author, his *Modern Science and Modern Thought* (1885), *Problems of the Future* (1889), and *Human Origins* (1892) being widely read, not only by reason of the writer's influential position, experience of affairs, and clear style, but also through their popular and at the same time well-informed

treatment of the latest scientific problems of the day. Laing died at Sydenham, 6th August 1897.

Lake Charles, a city of Louisiana, U.S.A., capital of Calcasieu, on the Calcasieu river and on the Port Arthur route and the Kansas City, Watkins and Gulf and the Southern Pacific railways. The manufacture of lumber is the principal industry. Population (1880), 838; (1890), 3442; (1900), 6680, of whom 409 were foreign-born and 2407 negroes.

Lake District, a characteristic region of England, in the counties of Cumberland, Westmorland, and Lancashire, celebrated for the beauty, and even in some degree for the grandeur, of its mountain scenery, and for the loveliness of its lakes. In outline the district is roughly circular, the valleys radiating outwards, each about 15 miles, from an imaginary centre near Langdale Pikes. Most of these valleys contain lakes, long and narrow; and upon the mountains there are frequent tarns. The valley lakes are of two types, one shallow, the other deep. Those of the first group, embracing only Derwentwater and Bassenthwaite, have an average depth of 18 feet. The rest, all belonging to the second group, average 40 to 135 feet in depth, and as a rule have steeply sloping sides and flat bottoms, the lake bed in two of them—Windermere and Ullswater—being divided into basins. Three of the lakes—Windermere, Coniston, and Wastwater—go down in depth below the level of the sea. The district as a whole is grooved by a main depression, running from north to south along the valleys of St John, Thirlmere, Grasmere, and Windermere, and by a secondary depression, in the same direction, along Derwentwater, Borrowdale, and Wastwater.¹ The subjoined table gives the names and other particulars of the larger lakes:—

Names.	Altitude above Sea Level.	Area in Square Miles.	Length.	Maximum Breadth.	Maximum Depth.	Average Depth.
	Feet.		Miles.	Yards.	Feet.	Feet.
Windermere . . .	130	5·7	10½	1610	219	78½
Coniston . . .	143	1·9	5	870	184	79
Wastwater . . .	200	1·1	3	880	258	134½
Ennerdale . . .	368	1·1	2½	1000	148	62
Crummock . . .	321	1·0	2	1000	144	87½
Derwentwater . . .	244	2·1	2½	2130	72	18
Bassenthwaite . . .	223	2·1	3	1300	70	18
Thirlmere . . .	533	0·5	2	1100
Ullswater . . .	476	3·4	7	...	205	83
Grasmere . . .	208	...	1	...	180	...
Rydal . . .	181	55	...
Hawes . . .	694	0·5	2	600	103	39½
Buttermere . . .	329	0·4	1½	670	94	54½

Windermere (or, more correctly, Winandermere), Coniston, Derwentwater, and Ullswater all contain small islands, amongst them being the Floating Island of Derwentwater, a mass of consolidated vegetation which periodically sinks to the bottom of the lake and reascends to its surface.² Fish—perch, pike, char, and trout—exist in Windermere, Ennerdale, Crummock, Derwentwater, and Bassenthwaite, and the gwyniad or "fresh-water herring" in Ullswater. In 1890-94 Thirlmere was dammed at its lower (northern) end, in order to convert the lake into a reservoir for supplying Manchester, 95 miles distant, with water, the dam being 800 feet long and 100 feet in height. The effect has been to raise the level of the lake permanently to 554 feet and increase its surface area from 330 acres to 565 acres; and its level can be raised another 30 feet, which would give an area of 793 acres. The present drainage area of 7400 acres would also be enlarged to 11,000

¹ See Dr H. R. Mill, in *Geog. Journal*, 1895, pp. 237-246.

² See Symons, *The Floating Island in Derwentwater* (1888).

acres. At the same time a new road was made by the Manchester Corporation along the west side of the lake. Grasmere, Rydal, and Coniston abound in literary associations (see below). The district derives variety and picturesqueness from several small waterfalls, *e.g.*, Scale Force (Dano-Norwegian, *fors*, *foss*), beside Crummock; Lodore, near Derwentwater, made famous by Southey; Dungeon Gill, or Ghyll, beside Langdale; Dalegarth Force or Stanley Gill, in Eskdale; Aira, near Ullswater, sung by Wordsworth; Stock Gill, near Ambleside; and Rydal Falls. The higher mountains range from 2000 to over 3000 feet in altitude. The highest peaks are Scafell Pike (3210 feet), and its sister Scafell (3162 feet); of the others the best known are Helvellyn (3118 feet), Skiddaw (3054 feet), Bowfell (2960 feet), Great Gable (2949 feet), Pillar (2927 feet), the Old Man of Coniston (2633 feet), and Langdale Pikes (2401 and 2323 feet). Some of these, such as Scafell, Great Gable, Helvellyn, Langdale Pikes, Old Man, and Pillar, furnish ascents which experienced mountaineers do not disdain.¹ The district is drained by the Derwent, Leven, Duddon, Esk, Irt, Ehen, and other small streams. Lead and zinc are still mined in the mountains around Keswick (see CUMBERLAND and WEST-MORLAND).

Climate.—The district records an unusually heavy rainfall. At Grasmere the annual average is 80 to 82 inches; on the mountains west of that village as much as 140 inches; and on Styhead pass, at the north foot of Scafell Pike, even as much as 243.98 inches was measured in 1872. At Keswick the annual mean is 59 to 60½ inches (55.4 inches in 1899); at Derwentwater 54½ inches. Taking the summer months (the tourist season), May to October inclusive, an annual average of 27.5 inches fell at Windermere during the eight years 1892–99 inclusive. During the same period, and at the same place, an average of 255 hours of sunshine was recorded for the same summer months.

Literary Associations.—Setting aside London and Edinburgh, there is no locality in the British Isles which is so intimately associated with the history of English literature as the Lake District. In point of time the poet whose name is first connected with the region is Gray, who wrote a journal of his tour in 1769. But it was Wordsworth, a native of Cumberland, born on the outskirts of the Lake District itself, who really made it a Mecca for lovers of English poetry. Out of his long life of eighty years, no less than sixty were spent amid its lakes and mountains, first as a schoolboy at Hawkshead, and afterwards as a resident at Grasmere (1799–1813) and Rydal Mount (1813–50). In the churchyard of Grasmere the poet and his wife lie buried; and very near to them are the remains of Hartley Coleridge (son of the poet), who himself lived many years at Keswick, Ambleside, and Grasmere. Southey, the friend of Wordsworth, was a resident of Keswick for exactly forty years (1803–43), and was buried in Crosthwaite churchyard. Samuel Taylor Coleridge lived some time at Keswick, and also with the Wordsworths at Grasmere. From 1807 to 1815 Christopher North (John Wilson) was settled at Windermere. De Quincey spent the greater part of the years 1809 to 1828 at Grasmere, in the first cottage which Wordsworth had inhabited. Ambleside, or its environs, was also the place of residence of Dr Arnold (of Rugby), who spent there the vacations of the last ten years of his life; and of Harriet Martineau, who built herself a house there in 1845. At Keswick Mrs Lynn Linton was born in 1822. Brantwood, a house beside Coniston Lake, was the home of Ruskin during the last years of his life. In addition to these residents or natives of the locality, Shelley, Scott, Nathaniel Hawthorne, Clough, Crabb Robinson, Carlyle, Keats, Tennyson, Matthew Arnold, Mrs Hemans, Gerald Massey, and others of less reputation made longer or shorter visits, or were bound by ties of friendship with the poets already mentioned. The Vale of St John, near Keswick, recalls Scott's *Bridal of Triermain*. But there is a deeper connexion than this between the Lake District and English letters. German literature tells of several literary schools, or groups of writers animated by the same ideas, and working in the spirit of the same principles and by the same poetic methods. The most notable instance—indeed it is almost the only instance—of the kind in English literature is the Lake School of Poets. Of this school the acknowledged head and founder was Wordsworth, and the tenets it professed are those laid down by the poet himself in the famous preface to the edition

of *The Lyrical Ballads* which he published in 1800. Wordsworth's theories of poetry—the objects best suited for poetic treatment, the characteristics of such treatment, and the choice of diction suitable for the purpose—may be said to have grown out of the soil and substance of the lakes and mountains, and out of the homely lives of the people, of Cumberland and Westmorland. Wordsworth is the poet of Nature, as he was the worshipper and priest of the Divine in Nature, and preacher of the beauty and sublimity of the moral law. But the Nature which he worshipped, the Nature which he sang, was nature as he saw her in the green dales, and beside the peaceful lakes and green or craggy fells, of his native Cumberland; just as the people, whose sincere and simple lives supplied themes for so many of his poems, were the sturdy natives of the same beautiful region. Thus it were hardly an exaggeration to say that the poetic principles of the Lake School are to a certain extent a reflection of the spirit of the Lake District itself. At any rate, not only did its beauties entwine themselves amongst the most cherished recollections of Wordsworth's boyhood, but they also awakened his poetic consciousness, and quickened and ripened his poetic faculty, so that he was enabled to enter into the most intimate sympathy with Nature, and bring the Divine which is immanent in her into close, practical relation with the thoughts and feelings of ordinary men. For a fuller discussion of the poet's poetic creed, see the late Professor Minto's admirable article on WORDSWORTH in the earlier volumes (ninth edition) of this Encyclopædia.

Dalton, the chemist, whose name is inseparably linked with the Atomic Theory, was born near Cockermonth, and Sir John Richardson, the Arctic explorer, and Romney, the painter, both lived for some time in the district. The chief mansion in the Lake District is Lowther Castle, partly in the Gothic, partly in the Baronial style, built in 1726 from designs by Sir Robert Smirke; it contains a good collection of pictures by Dutch and other old masters. At Eden Hall, the seat of the Musgrave family, is kept the glass goblet called "the Luck of Eden Hall," to which a well-known legend is attached. Brougham Hall, in the same neighbourhood, near Penrith, was the ancestral inheritance, and frequently the residence, of Lord Brougham. Muncaster Castle, near the old Roman port of Ravenglass at the mouth of the Esk, has many vestiges of the Roman occupation in its neighbourhood. The antiquarian objects include the Roman encampment known as Hardknott Castle, in Eskdale, with remains of a shrine and of a house with a bath; the remains of a supposed Roman encampment at Brougham Castle, near Penrith; the circular area, with fosse and mound, known as King Arthur's Round Table, also near the same place; and the ruins of Shap Abbey, of Egremont Castle, belonging to Lord Leconfield, of Calder Abbey, four miles south-east from Egremont, and of Furness Abbey, though these, like most of the preceding, lie on the outer fringe of the district rather than actually within its confines.

Lakewood, a village of Ocean county, New Jersey, U.S.A., 8 miles from the coast, and 44 miles nearly south of New York City, on the Central of New Jersey railroad, in a region of pine-woods and ponds. Owing to its temperate, salubrious climate it has become a noted winter resort, with large hotels and many cottages. Population of the township, including the village (1895), 2201; (1900), 3094.

Lakhimpur, a district of British India, in the Brahmaputra Valley division of Assam. The deputy-commissioner in charge exercises political control over numerous tribes beyond the inner surveyed border. The most important of these tribes are the Miris, Abors, Mishmis, Khantis, Singphos, and Nagas. The civil headquarters are at Dibrugarh; the military frontier post is at Sadiya, the limit of navigation on the Brahmaputra. Area, 37.24 square miles; population (1881), 179,895; (1891), 254,043, showing an increase of 41 per cent.,

¹ See Haskett-Smith, *Climbing in the British Isles*, Part I.; and Owen G. Jones, *Rock-Climbing in the English Lake District*, 2nd ed. by W. M. Crook (Keswick, 1900).

mainly due to the immigration of tea-coolies; average density, 68 persons per square mile, the lowest in the Brahmaputra valley. Classified according to religion, Hindus numbered 227,350; Mahommedans, 8086; Buddhists, 4462; Christians, 1606, of whom 305 were Europeans; hill tribes, 12,536; "others," 3. In 1901 the population was 371,784, showing a further increase of 46 per cent. The land revenue is Rs.5,40,367, the incidence of assessment being Rs.2 : 8 : 11 per acre; number of police, 1018; number of boys at school (1896-97), 3859, being 18.96 per cent. of the male population of school-going age; registered death-rate (1897), 41.58 per thousand. Lakhimpur was the first district into which tea cultivation was introduced by the Government, and the Assam Company commenced operations here in 1840. In 1897 the number of gardens was 149, with 55,560 acres under tea, employing 121,460 persons, of whom 46,428 had been imported under contract, and producing an out-turn of just 19,000,000 lb, or at the rate of 400 lb per acre. Lakhimpur is also the scene of operations of the Assam railways and Trading Company, which owns a railway, coal mines, and petroleum wells. The railway, known as the Dibru-Sadiya line, runs from Dibrugarh to Makum, with two branches to Talap and Margherita; total length, 77½ miles. It will ultimately be connected across the hills with the Assam-Bengal railway. The capital outlay is Rs.74,22,050. In 1897 the gross receipts were Rs.7,87,359, and the net profits Rs.2,46,749. The company has five coal mines, of which the total output in 1897 was 184,271 tons, yielding to Government a rent and royalty of Rs.33,000. The coal is of excellent quality, and is exported by river as far as Calcutta. The Assam Company works another mine, yielding 1000 tons. The chief oil-wells are at Digboi, where a depth of 1680 feet has been reached. In 1897 the output was 219,780 gallons, yielding to Government a royalty of Rs.5500. The oil is refined at Margherita, producing a good quality of kerosene oil and first-class paraffin, with wax and other by-products. The wells at Makum are disappointing. In 1897 they produced 2297 gallons. The oil is entirely without kerosene or paraffin, but is valuable as a lubricant. The company also manufactures bricks and pipes of various kinds. In 1897 the out-turn of their railway workshops was valued at Rs.1,55,782. Yet another industry is timber-mills, for the manufacture of tea-chests, &c. There are five of these, employing 800 persons, with an out-turn valued at Rs.3,75,000.

Lalin, a township in the north-east of Spain, in the province of Pontevedra. The population in 1897 was 16,441. It is a centre of the trade in agricultural products of the fertile district around it. The local industries are supplied by paper-mills and tanneries. Lalin is situated in the neighbourhood of the ruins of the historic abbey of Carboeiro, a noble Gothic pile.

Lalitpur, formerly a district of British India, in the Allahabad division of the North-West Provinces, incorporated with Jhansi. Area, 1948 square miles. Population (1881), 249,088; (1891), 274,200, showing an increase of 10 per cent.; average density, 141 persons per square mile, being far the lowest in the province except in the Himalayan tracts; number of vernacular schools (1896-97), 45, with 1450 pupils. The district is traversed by the line of the Indian Midland railway from Bhopal to Jhansi. The town of LALITPUR has a population (1891) of 11,348; municipal income (1897-98), Rs.16,468, the incidence of taxation being just over R.1 per head; death-rate (1897), 76.84 per thousand. It is a railway station, 56 miles south of Jhansi.

Lalo, Edouard (1823-1892), French composer,

was born at Lille, 27th January 1823. He began his musical studies at the conservatoire at Lille, and subsequently went to Paris, where he attended the violin classes of Habeneck, and also worked at composition. For several years Lalo led a modest and retired existence, playing the viola in the quartet party organized by Arningaud and Jacquard, and in composing chamber music. His early works include two trios, a quartet, and several pieces for violin and pianoforte. Discouragement seems to have taken possession of Lalo, for he remained some years without bringing forward anything new. In 1867, however, he took part in an operatic competition, an opera from his pen, entitled *Fiesque*, obtaining the third place out of forty-three. This work was actually accepted for production at the Paris Opéra, but delays occurred, and nothing was done. *Fiesque* was next offered to the Théâtre de la Monnaie, Brussels, and was definitely to be produced there when the manager became bankrupt. Thus, when nearly fifty years of age, Lalo found himself again stranded. *Fiesque* was never performed, but the composer published the pianoforte score, and eventually employed some of the music in other works. After the Franco-German war French composers found their opportunity in the concert-room. Lalo was one of these, and during the succeeding ten years several interesting works from his pen were produced, among them a sonata for violoncello, a "divertissement" for orchestra, a violin concerto, and the *Symphonie Espagnole* for violin and orchestra, one of his best-known compositions. In the meanwhile he had written a second opera, *Le Roi d'Ys*, which he fondly hoped would be produced at the Opéra. The administration offered him the "scenario" of a ballet instead. Lalo was perforce obliged to be content with this, and set to work with so much energy that he fell ill while engaged upon the music of this ballet, the last scenes of which were orchestrated by Gounod. *Namouna*, the ballet in question, was produced at the Opéra in 1882. Six years later, on 7th May 1888, *Le Roi d'Ys* was brought out at the Opéra Comique, and Lalo was at last enabled to taste the sweets of success. Unfortunately, fame came to him too late in life. A pianoforte concerto and the music to *Néron*, a pantomimic piece played at the Hippodrome in 1891, were his last two works. He had begun a new opera, but had only written the first act when, on 23rd April 1892, he was carried off by an attack of paralysis. This opera, *La Jacquerie*, was finished by M. Arthur Coquard, and was produced in 1895, three years after the death of Lalo, at Monte Carlo, Aix-les-Bains, and finally in Paris. Lalo had distinct originality, discernible in his employment of curious rhythmic devices. His music is ever ingenious and brilliantly effective. (A. HE.)

La Marmora, Alfonso (1804-1878), Italian general and statesman, was born at Turin on 18th November 1804. He entered the army as lieutenant of artillery in 1823, but was only captain in March 1848, when he gained distinction and the rank of major at the battle of Pastrengo. On 5th August 1848 he liberated Carlo Alberto from the Milan revolutionaries, and in October was promoted general and appointed Minister of War. After suppressing the revolt of Genoa in 1849, he again assumed (November 1849) the portfolio of war, which, save during the period of his command of the Crimean expedition, he retained until 1859. Having reconstructed the Piedmontese army, he took part in the war of 1859; but in July of that year succeeded Cavour in the premiership. In 1860 he was sent to Berlin and St Petersburg to prepare the recognition of the kingdom of Italy, and subsequently held the offices of governor of Milan and

royal lieutenant at Naples, until, in September 1864, he succeeded Minghetti as premier. In this capacity he modified the scope of the September Convention by a note in which he claimed for Italy full freedom of action in respect of national aspirations to the possession of Rome, a document of which Visconti Venosta afterwards took advantage when justifying the Italian occupation of Rome in 1870. In April 1866 La Marmora concluded the Italo-Prussian alliance against Austria, and, on the outbreak of war in June, took command of an army corps, but was defeated at Custozza on 23rd June. Accused of treason by his fellow-countrymen, and of duplicity by the Prussians, he eventually published in defence of his tactics (1873) a series of documents entitled "More Light on the Events of 1866," a step which caused irritation in Germany, and exposed him at home to the charge of having violated State secrets. Meanwhile he had been sent to Paris in 1867 to oppose the French expedition to Rome, and in 1870, after the occupation of Rome by the Italians, had been appointed lieutenant-royal of the new capital. He died at Florence on 5th January 1878. (H. W. S.)

Lambayeque, a department of northern Peru, is divided into three provinces—Lambayeque, Chiclayo, and Pacasmayu, of which the principal towns are Lambayeque (population, 6000), Chiclayo (14,000), and Ferriñafe (8000). The area of the department is 17,939 square miles. Population (1896), 124,091.

Lambeth Conferences.—The Lambeth Conferences, or "Pan-Anglican Synods," were an outcome of that fellowship amongst the churches of the Anglican Communion which has shown so remarkable a development in recent years. There had been a growing sense that this fellowship could only be maintained by mutual knowledge and common counsel, and in 1851 Bishop Hopkins of Vermont, in a letter to the archbishop of Canterbury, expressed his desire that "in a time of controversy and division there should be a council of all the bishops in Communion with your Grace." But the immediate impulse came from the colonial Church in Canada. In 1865 the synod of that province, in an urgent letter to the archbishop of Canterbury (Dr Longley), represented the unsettlement of members of the Canadian Church caused by recent legal decisions of the Privy Council, and their alarm lest the revived action of Convocation "should leave us governed by canons different from those in force in England and Ireland, and thus cause us to drift into the status of an independent branch of the Catholic Church." They therefore requested him to call a "national synod of the bishops of the Anglican Church at home and abroad," to meet together under his leadership for the purpose of taking combined counsel and action. After consulting both Houses of the Convocation of Canterbury, Archbishop Longley assented, and convened all the bishops of the Anglican Communion (then 144 in number) to meet at Lambeth in 1867. Many Anglican bishops (amongst them the archbishop of York and most of his suffragans) felt so doubtful as to the wisdom of such an assembly that they refused to attend it, and Dean Stanley declined to allow Westminster Abbey to be used for the closing service, giving as his reasons the partial character of the assembly, uncertainty as to the effect of its measures, and "the presence of prelates not belonging to our Church." Archbishop Longley said in his opening address, however, that they had no desire to assume "the functions of a general synod of all the churches in full communion with the Church of England," but merely to "discuss matters of practical interest, and pronounce what we deem expedient in resolutions which may serve as safe guides to future action." Experience has shown how valuable and wise this course was. The resolutions

of the Lambeth Conferences have never been regarded as synodical decrees, but their weight has increased with each conference; and in particular the "Lambeth Quadrilateral" of 1888 has already had a great effect as a plan of reunion. Apprehensions such as those which possessed the mind of Dean Stanley have long passed away.

Seventy-six bishops accepted the Primate's invitation to the first Conference, which met at Lambeth on 24th September 1867, and sat for four days, the sessions being in private. The archbishop opened the Conference with an address: deliberation followed (but the appointed subjects were not strictly adhered to); committees were appointed to report on special questions; resolutions were adopted, and an encyclical letter was drawn up and addressed to the faithful of the Anglican Communion. Each of the subsequent Conferences has been first received in Canterbury Cathedral and addressed by the archbishop from the chair of St Augustine. It has then met at Lambeth, and after sitting for five days for deliberation upon the fixed subjects and appointment of committees, has adjourned, to meet again at the end of a fortnight and sit for five days more, to receive reports, adopt resolutions, and to put forth the encyclical letter.

I. *First Conference* (September 24–28, 1867), convened and presided over by Archbishop Longley. The proposed order of subjects was entirely altered in view of the Colenso case, for which urgency was claimed; and most of the time was spent in discussing it. Of the thirteen resolutions adopted by the Conference, two have direct reference to this case; the rest have to do with the creation of new sees and missionary jurisdictions, commendatory letters, and a "voluntary spiritual tribunal" in cases of doctrine, and the due subordination of synods. The reports of the committees were not ready, and were carried forward to the Conference of 1878.

II. *Second Conference* (July 2–27, 1878), convened and presided over by Archbishop Tait. On this occasion no hesitation appears to have been felt; 100 bishops were present, and the opening sermon was preached by the archbishop of York. In this instance the reports of the five special committees (based in part upon those of the committee of 1867) were embodied in the encyclical letter, viz., on the best mode of maintaining union, voluntary boards of arbitration, missionary bishops and missionaries, Continental chaplains, and the report of a committee on difficulties submitted to the Conference.

III. *Third Conference* (July 3–27, 1888), convened and presided over by Archbishop Benson; 145 bishops present; the chief subject of consideration being the position of communities which do not possess the Historic Episcopate. In addition to the encyclical letter, nineteen resolutions were put forth, and the reports of twelve special committees are appended upon which they are based, the subjects being Intemperance, Purity, Divorce, Polygamy, Observance of Sunday, Socialism, Care of Emigrants, Mutual Relations of Dioceses of the Anglican Communion, Home Reunion, Scandinavian Church, Old Catholics, &c., Eastern Churches, Standards of Doctrine and Worship. Perhaps the most important of these is the famous "Lambeth Quadrilateral," which laid down a fourfold basis for home reunion—the Holy Scriptures, the Apostles' and Nicene Creeds, the two Sacraments ordained by Christ Himself, and the Historic Episcopate.

IV. *Fourth Conference* (July 5–31, 1897), convened by Archbishop Benson, presided over by Archbishop Temple; 194 bishops present. One of the chief subjects for consideration was the creation of a "tribunal of reference"; but the resolutions on this subject were withdrawn, owing, it is said, to the opposition of the American bishops, and a more general resolution in favour of a "consultative body" was substituted. The encyclical letter is accompanied by sixty-three resolutions (which include careful provision for provincial organization and the extension of the title "archbishop" to all metropolitans, a "thankful recognition of the revival of brotherhoods and sisterhoods, and of the office of Deaconess," and a desire to promote friendly relations with the Eastern Churches and the various Old Catholic bodies), and the reports of the eleven committees are subjoined.

See Bishop R. T. DAVIDSON, *The Lambeth Conferences of 1867, 1878, and 1888*, London, 1896. *Conference of Bishops of the Anglican Communion, Encyclical Letter, &c.*, London, 1897. (M. B. S.)

Lamego, a town and episcopal see of Portugal, district Vizeu, 4 miles south of the Douro and 42 east of Oporto. It is famous for its fine fruit and hams.

Vineyards in 1892 covered 3650 acres, and yielded 755,250 gallons of wine, valued at £48,450. Population (1900), 9179.

Lamoureux, Charles (1834–1899), French conductor and violinist, was born at Bordeaux, 28th September 1834. He studied at the Pau Conservatoire, was engaged as violinist at the Opéra, and in 1864 organized a series of concerts devoted to chamber music. Having journeyed to England and assisted at a Handel festival, he thought he would attempt something similar in Paris. At his own expense he founded the "Société de l'Harmonie Sacrée," and in 1873 conducted the first performance in Paris of Handel's *Messiah*. He also gave performances of Bach's *St Matthew Passion*, Handel's *Judas Maccabæus*, Gounod's *Gallia*, and Massenet's *Eve*. In 1875 he conducted the festival given at Rouen to celebrate the centenary of Boieldieu. The following year he became *chef d'orchestre* at the Opéra Comique. In 1881 he founded the famous concerts associated with his name, which contributed so much to popularize Wagner's music in Paris. The performances of detached pieces taken from the German master's works did not, however, satisfy him, and he matured the project to produce *Lohengrin*, which at that time had not been heard in Paris. For this purpose he took the Eden Theatre, and on 3rd May 1887 he conducted the first performance of Wagner's opera in the French capital. Owing to the opposition of the Chauvinists of the press and streets, the performance was not repeated; but it doubtless prepared the way for the production of the same masterpiece at the Paris Opéra a few years later. Lamoureux was successively second *chef d'orchestre* at the Conservatoire, first *chef d'orchestre* at the Opéra Comique, and twice first *chef d'orchestre* at the Opéra. He visited London on several occasions, and gave successful concerts at the Queen's Hall. Lamoureux, whose death occurred at Paris in December 1899, may be said to have died in harness. *Tristan und Isolde* had been at last heard in Paris, owing to his initiative and under his direction. After conducting one of the performances of this masterpiece, he was taken ill, and succumbed in a few days, having had the consolation before his death of witnessing the triumph of the cause he had so courageously championed. (A. H.E.)

Lampedusa, an island of Italy, belonging to the province of Girgenti, commune Licata, but situated halfway between Malta and the African coast. Area, 11½ square miles. In 1897 its port was cleared by 170 vessels of 27,621 tons. Population, about 1200. The small island of LINOSA, 11 miles in circumference, with about 200 inhabitants, lies 31 miles to the north-north-east, and likewise belongs to the commune of Licata. In 1897 its port was cleared by 121 vessels of 25,286 tons.

Lampeter, a municipal borough (1884), market town, and railway station of Cardiganshire, Wales, on the Teify, 23 miles north-north-east of Carmarthen. A parliamentary borough until 1885, its representation is now merged in that of the county. St David's College, founded in 1827, has power to grant certain degrees, and is affiliated to the Universities of Oxford and Cambridge. A college school for boys has been opened, and also a secondary school for girls. There is a town hall. Area, 1754 acres. Population (1881), 1443; (1891), 1569; (1901), 1722.

Lanark, a royal and parliamentary burgh (Falkirk group) and the county town of Lanarkshire, half a mile from the Clyde, 31 miles south-east of Glasgow by rail. A new water scheme has been carried out and the drainage system renewed. A fountain in commemoration of Queen

Victoria's Jubilee has been erected; also, a convalescent home. Cattle and sheep dealing is the most important industry, and a large retail trade is done with the surrounding country. Population (1881), 5874; (1891), 5537; (1901), 6440. Cotton mills founded by Robert Owen at NEW LANARK have been doubled in size since 1881.

Lanarkshire, an inland county of Scotland, bounded on the N. by Dumbarton and Stirling, on the E. by Stirling, Linlithgow, Mid-Lothian, and Peebles, on the S. by Dumfries, and on the W. by Ayr, Renfrew, and Dumbarton.

Area and Population.—In 1891 the parishes of Kirkpatrick-Juxta and Moffat were placed wholly in Dumfriesshire; the Peebles part of Culter parish was added to another Peebles parish. In 1892 Cathcart parish was placed wholly in Renfrew, and the Renfrew parts of East Kilbride and Govan wholly in Lanark. In 1893 the city of Glasgow, a large part of which was included in Lanarkshire, was made a county of a city. The area of the county is 567,027 acres, or about 886 square miles. It is much the most populous county in Scotland. In 1881 the population was 904,412; in 1891, 1,046,040; in 1891 on the above area, 1,105,899; in 1901, 1,339,289, of whom 674,136 were males and 665,153 females. On the old area, taking land only (564,284 acres or 881·7 square miles), the number of persons to the square mile in 1891 was 1186, and the number of acres to the person 0·5. In the registration county the population increased between 1881 and 1891 by 15·8 per cent. Between 1881 and 1891 the excess of births over deaths was 149,761, and the increase of the resident population 141,628. The following table gives particulars of births, deaths, and marriages in 1880, 1890, and 1899:—

Year.	Deaths.	Marriages.	Births.	Per cent. of Illegitimate.
1880	22,466	7241	35,227	6·7
1890	23,526	9221	38,069	6·09
1899	25,846	11,402	43,774	5·4

The following table gives the birth-rate, death-rate and marriage-rate per thousand of the population for a series of years:—

	1880.	1881-90.	1890.	1891-98.	1899.
Birth-rate . . .	37·98	36·85	35·25	35·48	35·65
Death-rate . . .	24·17	22·12	21·78	20·88	21·04
Marriage-rate . .	7·79	8·02	8·53	8·30	9·28

In 1891 the number of Gaelic-speaking persons in the county was 25,208, and of foreigners 2982. Valuation in 1889-90, £2,226,352; 1899-1900, £2,502,345.

Administration.—The county is divided into six parliamentary divisions—North-east, North-west, Mid, and South Lanark, Govan, and Partick. The royal burghs, in addition to Glasgow, are Lanark (6440) and Rutherglen (18,280), of which the former belongs to the Falkirk group and the latter to the Kilmarnock group of parliamentary burghs. Airdrie (22,288) and Hamilton (32,775) are parliamentary burghs of the Falkirk group, and Coatbridge (36,981) is a municipal burgh included in the North-west parliamentary division. Other towns are Govan (76,351); Kinning Park (13,851); Motherwell (30,243); Partick (54,274), and Wishaw (20,869)—all police burghs. Fifteen other towns had more than 2000 inhabitants in 1891. There are 39 civil parishes, and including the two for Glasgow parish, there are eight poor-houses; the number of paupers and dependants (Glasgow included) in September 1899 was 27,156. There are lunatic asylums for the county at Hartwood in the parish of Shotts, and at Bothwell, and one of the Glasgow asylums is at Gartloch in the parish of Cadder. Lanark is a sheriffdom, whose sheriff-principal is confined to his judicial duties in the county, and he has eight substitutes, five of whom sit constantly in Glasgow, and one each at Airdrie, Hamilton, and Lanark.

Education.—Fifty school boards manage 274 schools, which had an average attendance of 145,703 in 1898-99, while 74 voluntary schools, of which 56 were Roman Catholic and one Episcopal, had 39,388. There are six high schools in Glasgow and one at Hamilton, a technical school at Coatbridge, and two secondary and technical schools (one Roman Catholic) at Wishaw, in addition to the Glasgow and West of Scotland Technical College. Thirteen other schools under the Glasgow board, 10 under the Govan board, and 62 in other parts of the county, earned grants in 1898 for giving higher education. The county council expends the "residue" grant in supporting lectures and classes in agriculture and agricultural chemistry, mining, dairying, cooking, laundry

work, nursing, and poultry-keeping, and in paying fees and railway fares and providing bursaries for technical students, and in subsidizing science and art and technical classes in day and evening schools. A director of technical education is maintained by the council. Lanark, Motherwell, and Biggar entrust their shares of the grant to the county council, and Coatbridge and Airdrie themselves subsidize science and art and evening classes and continuation schools.

Agriculture.—The proportion of the acreage cultivated in 1898 was 45·2, the county ranking eleventh in Scotland in this regard. In the Lower Ward market-gardening continues to increase, and there have been large additions in recent years to the quantity of glass. There were 717 acres under orchards in 1898 and 1899 under small fruit, strawberries being grown on a very large scale in the parishes of Lesmahagow, Dalserf, Lanark, Carluke, and Cambusnethan. In the whole county there were 21,499 acres under wood in 1895, of which 957 had been planted since 1881. Oats preponderate in the corn crops, covering 37,691 acres out of 41,406 in 1898. The following table gives the principal acreages at intervals of five years from 1880 :—

Year.	Area under Crops.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	247,053	50,321	19,584	61,137	115,048	934
1885	256,083	47,975	16,859	88,296	102,285	666
1890	258,637	42,563	16,403	115,783	81,741	426
1895	256,737	41,510	16,225	108,043	88,567	327
1899	255,841	41,110	16,600	102,006	93,734	376

The following table gives particulars of the live stock during the same years :—

Year.	Total Horses.	Total Cattle.	Cows or Heifers in Milk or Calf.	Sheep.	Pigs.
1880	7795	65,192	33,272	217,563	6110
1885	7418	72,082	37,215	214,936	8671
1890	7988	75,775	38,604	236,930	7957
1895	8631	71,367	38,222	232,673	8560
1899	8074	75,408	39,574	252,199	7213

Of the 3102 holdings in 1895 the average size was 83 acres. The percentage under 5 acres was 11·99, between 5 and 50 acres 33·53, and over 50 acres 54·48. The number of farms between 50 and 100 acres was 698, between 100 and 300, 918, between 300 and 500, 65, and over 500 acres 9. At the census of 1891, 8896 men and 1813 women were returned as being engaged in agriculture.

Industries and Trade.—The following table gives the output of the principal minerals in 1890 and 1899 :—

Year.	Coal.		Ironstone.		Fireclay.		Sandstone.	
	Tons.	Value.	Tons.	Value.	Tons.	Value.	Tons.	Value.
1890	13,584,770	4,584,860	113,501	58,525	294,925	55,744	—	—
1899	16,416,754	6,123,364	189,523	97,358	427,590	61,943	334,282	74,240

Forty blast furnaces produced 496,218 tons of pig-iron in 1890 ; 85 furnaces produced 1,170,830 tons in 1899. In 1899 were also obtained 56,335 tons of limestone valued at £13,560, and 76,246 tons of oil-shale valued at £19,066.

The industries of the county are for the most part the same as those of Glasgow, and reference may be made to the articles on that city and on other towns of Lancashire for details. The number of persons connected with industrial pursuits in 1891 was 260,461 men and 86,468 women, of whom machines and implements engaged the labour of 24,549 men ; ships, 9488 ; textiles, 14,194 men and 28,212 women ; minerals, 94,473 men and 2713 women. About a score of new short branches and extensions have been opened in the county during the past twenty-five years by the three leading Scottish railway companies, the addition to the mileage being between 70 and 80 miles.

Lancashire, a north-western maritime county of England, bounded on the N. by Westmorland, on the E. by Yorkshire, on the S. by Cheshire and the estuary of the Mersey, and on the W. by the Irish Sea. The Furness district to the north, having as its southern boundary the Irish Sea, is detached from the rest of the county and interpolated between Cumberland and Westmorland.

Area and Population.—The area of the ancient county is 1,207,311 acres, or 1887 square miles, with a population in 1881 of 3,454,438 and in 1891 of 3,926,760, of whom 1,889,926 were males and 2,036,834 females, the number of persons per square mile being 2081, and of acres to a person 0·31. In 1901 the population numbered 4,406,787. The area of the administrative county in 1891 was 1,124,450 acres with a population of 1,768,273, or, including the county boroughs, of 1,202,726 acres, with a population of 3,906,721. Since 1891, however, various changes have been made in the administrative area ; in 1895 the county borough of Liverpool was extended, and the parish of Dalton in Lancashire was transferred to Westmorland ; in 1896 part of the townships of Appleton-with-Hull, Latchford Without, and Walton Inferior were transferred from Cheshire to Lancashire and added to the municipal borough of Warrington ; and in 1898 part of the township of Ashton-under-Lyne was transferred to Cheshire. The population of the administrative county, without the county boroughs, in 1901 was 1,827,390 ; and with the boroughs, 4,386,961. The area of the registration county is 1,306,777 acres, with a population in 1891 of 3,957,906, of which 3,646,314 were urban and only 311,592 rural. Within the registration area the percentage of increase between 1881 and 1891 was 13·54. The excess of births over deaths between 1881 and 1891 was 448,538, but this was exceeded by the actual increase of the population, which was 472,807. In 1901 the population of the registration county numbered 4,437,398, of whom 2,131,162 were males and 2,306,236 were females.

The following table gives the number of marriages, births, and deaths, with the number of illegitimate births for 1880, 1890, and 1898 :—

Year.	Marriages.	Births.	Deaths.	Illegitimate Births.	
				Males.	Females.
1880	28,111	126,842	81,812	2918	2855
1890	32,480	125,787	91,739	2840	2563
1898	37,060	132,491	83,831	2631	2524

In 1891 the number of marriages was 37,854, of births 131,945, and of deaths 92,239.

The following table gives the marriage-, birth-, and death-rates, with the percentage of illegitimate births, for a series of years :—

	1870-79.	1880.	1880-89.	1890.	1888-97.	1898.
Marriage-rate . . .	18·6	16·3	16·2	16·6	16·2	17·1
Birth-rate . . .	38·8	36·8	35·1	32·1	32·2	30·6
Death-rate . . .	25·7	23·8	24·5	23·4	21·6	19·4
Percentage of illegitimate births . . .	4·7	4·6	4·5	4·3	4·1	3·9

The marriage-, birth-, and death-rates are all considerably above the average, but the percentage of illegitimate births is below it. In 1891 the number of Scots in the county was 56,405, of Irish, 164,489, and of foreigners, 25,109.

Constitution and Government.—For parliamentary purposes the four divisions of the ancient county—North Lancashire, North-east Lancashire, South-east Lancashire, and South-west Lancashire—are subdivided into twenty-three divisions ; and the county also includes the parliamentary boroughs of Liverpool with nine parliamentary divisions, Manchester with six, and Salford with three, while the following boroughs return two members: Blackburn, Bolton, Oldham, and Preston ; and the following return one each : Barrow-in-Furness, Burnley, Bury, Rochdale, St Helens, Salford, and Wigan, in addition to which parts of Ashton-under-Lyne, Stalybridge, Stockport, and Warrington are included in the county. The administrative county contains the following municipal boroughs: Accrington (43,095), part of Ashton-under-Lyne (43,890), Bacup (22,505), Barrow-in-Furness (57,584), Blackburn (127,527), Blackpool (47,346), Bolton (168,205), Bootle (58,558), Burnley (97,044), Bury (58,028), Chorley (26,850), Clitheroe (11,414), Colne (23,000), Darwen (38,211), Eccles (34,369), Haslingden (18,543), Heywood (25,461), Lancaster (40,329), Leigh (40,001), the city of Liverpool (684,947), the city

of Manchester (543,969), Middleton (25,178), Mossley (13,452), Nelson (32,816), Oldham (137,238), Preston (112,982), Rawten-stall (31,052), Rochdale (83,112), St Helens (84,410), Salford (220,956), Southport (48,087), Warrington (64,241), Widnes (28,580), and Wigan (60,770). Barrow-in-Furness, Blackburn, Bolton, Bootle, Burnley, Bury, Liverpool, Manchester, Oldham, Preston, Rochdale, St Helens, Salford, and Wigan are county boroughs. The urban districts are too numerous for mention. The following have populations of over 10,000: Ashton-in-Makerfield (18,695), Atherton (16,211), Birkdale (14,197), Chad-derton (24,892), Crompton (13,427), Dalton-in-Furness (13,020), Denton (14,934), Droylsden (11,087), Failsworth (14,152), Farn-worth (25,927), Fleetwood (12,093), Garston (17,288), Gorton (26,564), Great Harwood (12,014), Hindley (23,504), Horwich (15,083), Ince-in-Makerfield (21,270), Levenshulme (11,485), Litherland (10,593), Littleborough (11,166), Morecambe (11,798), Moss-side (26,677), Newton-in-Makerfield (16,699), Oswaldtwistle (14,200), Padiham (12,205), Pemberton (21,664), Prestwich (12,837), Radcliffe (25,368), Ramsbottom (15,920), Royton (14,881), Stretford (30,346), Swinton-and-Pendlebury (27,001), Turton (12,353), Tyldesley-with-Shakerley (14,843), Ulverston (10,064), Walton-le-Dale (11,271), Waterloo-with-Seaforth (23,101), West Houghton (14,377), Withington (36,201), and Worsley (12,448). The county is in the northern circuit, and assizes are held for North Lancashire at Lancaster, and for South Lancashire at Liverpool and Manchester. Twenty-five of the bor-oughs have separate commissions of the peace, and the boroughs of Blackburn, Bolton, Liverpool, Manchester, Oldham, Salford, and Wigan have also separate courts of quarter sessions. The county is still attached to the duchy of Lancaster, and retains the chancery court for the county palatine. The ancient county is chiefly in the diocese of Manchester, but a small part is in Liverpool, the northern portion of Furness is in Carlisle, and a few parishes adjoining Yorkshire are in Ripon or in Wakefield. There are 730 entire ecclesiastical parishes or districts and parts of 10 others.

Education.—Manchester and Liverpool are each seats of a uni-versity and of other important educational institutions. Within the bounds of the county there are many denominational colleges, and at Ashton, near Whalley, is the famous Catholic college of Stonyhurst. There is a day training college for schoolmasters in connexion with University College, Liverpool, and a day training college for both schoolmasters and schoolmistresses in connexion with Owens College, Manchester. At Edgehill, near Manchester, there is a residential training college for schoolmistresses which takes day pupils, at Liverpool a residential Roman Catholic train-ing college for schoolmasters, and at Warrington a residential training college (Chester, Manchester, and Liverpool diocesan) for schoolmistresses. At Burnley there are a board blind school and a board deaf school; at Liverpool a Catholic blind asylum, a home for blind children, a school for deaf and dumb, and a school for the indigent blind; at Oldham, a board deaf school and a board blind school; at Preston, the Royal Cross School for the deaf; at Fulwood, an industrial institute for the blind; and at Stretford a blind asylum and the Manchester schools for the deaf. The total number of elementary schools in the county, including the county boroughs, on 31st August 1898 was 1796, of which 254 were board and 1542 voluntary schools, the latter including 884 National Church of England schools, 139 Wesleyan, 299 Roman Catholic, and 220 "British and other." The average attendance at voluntary schools was 446,224, and at board schools 144,203. The total school board receipts of the county boroughs for the year ended 29th September 1899 were over £775,037. The income under the Technical Instruction Act was over £7631, and that under the Agricultural Rates Act was over £269. The total school board receipts of the administrative county, apart from the boroughs, were over £127,631. The income under the Technical Instruction Act was over £150, and that under the Agricultural Rates Act was over £1098.

Communications.—By the opening of the Manchester Ship Canal, on 1st June 1894, a populous inland district has obtained the advantages of immediate sea transport. The canal, which is in great part formed by deepening the bed of the Mersey, stretches by Warrington and Runcorn towards Liverpool, the total length being 35½ miles, and the cost £11,750,000. The port of Liverpool is now second in importance only to that of London.

Agriculture.—About three-fourths of the county is under cul-tivation, and of this nearly three-fourths is in permanent pasture, cows being largely kept for the supply of milk to the towns, while in the uplands many sheep are reared. In addition to the culti-vated area, about 92,000 acres are under hill pasturage and over 40,000 acres are under woods. Since 1880 the acreage under corn crops has been gradually increasing, the increase being chiefly in the acreage under oats, which has increased about one-sixth, and is now about seven-tenths of the whole; but the acreage under wheat, now about one-fifth of the whole, has also increased, while there has been a great decrease in the acreage under barley. More than three-

fourths of the acreage under green crops is occupied by potatoes, and less than one-sixth is usually occupied by turnips and swedes. The following table gives the acreage of the larger main divisions of the cultivated area at intervals from 1885:—

Year.	Total Acre- age under Cultivation.	Corn Crops.	Green Crops.	Clover.	Permanent Pasture.	Fallow.
1880	783,065	100,189	56,894	63,161	559,976	2836
1885	809,927	102,005	56,573	75,380	574,016	1953
1890	824,846	103,688	53,324	86,221	578,044	1773
1895	823,676	103,320	54,087	76,363	585,996	1883
1900	822,866	104,024	51,820	81,374	576,616	1161

The following table gives the numbers of the principal live stock during the same years:—

Year.	Total Horses.	Total Cattle.	Cows.	Sheep.	Pigs.
1880	38,316	221,018	121,113	318,368	34,712
1885	35,625	238,158	130,662	296,425	43,880
1890	38,939	233,055	132,746	330,333	56,802
1895	44,775	226,234	130,041	306,954	60,421
1900	44,451	239,507	137,678	334,859	60,617

Industries and Trade.—According to the report for 1898 of the chief inspector of factories (1900), the total number of persons employed in factories and workshops in 1897 was 896,333, as compared with 896,848 in 1896. Of these 434,609 were employed in textile factories, there being a decrease of 1.1 per cent. both between 1895 and 1896 and between 1896 and 1897. The staple textile industry is cotton, which employed 411,808 persons, the centre of the trade being Manchester, Oldham, and the neighbour-ing towns. The woollen, worsted, and silk manufactures, though of less importance, employ considerable numbers, there being 13,805 employed in the woollen industry and 3009 in that of silk; 4439 were employed in connexion with the flax, hemp, or jute industries. In non-textile factories 384,352 persons were employed, there being an increase between 1895 and 1896 of 9.0 per cent., and between 1896 and 1897 of 0.4 per cent. The manufacture of machines, appliances, conveyances, tools, &c., occupied 112,596 persons, much of it being carried on on a large scale to supply the needs of the immense weaving and spinning industries. For the same purpose large quantities of bobbins are made from the wood grown in the northern districts of the county, wood industries employing 16,804 persons. At Barrow-in-Furness the manufacture of iron and steel has continued to develop; and in the county 24,089 persons were employed in the founding and conversion, 3580 in the extraction, and 2321 in the galvanizing, &c., of metals. In print, bleach, and dye works 52,672 persons were employed; in the manufacture of paper, &c., 28,092; in clothing industries, 25,222; in the manufacture of chemicals, 18,962; in food industries, 15,592; in those of drink, 8914; in glass-making, 9846; in india-rubber and gutta-percha industries, 6338; and in those of tobacco, snuff, and cigars, 5803. Work-shops employed 77,372 persons, of which 40,450 were employed in clothing industries, 6546 in the manufacture of machines, &c., 5711 in furniture making, and 5725 in food industries. The total number of persons employed in connexion with mines and quarries in 1899 was 90,679. In the same year 1,356,492 tons of clay were raised, 600,480 tons of limestone, 820,232 tons of sand-stone, 20,156 tons of slate, and 99,405 tons of salt, in addition to which 197,610 tons of salt were obtained from brine. In the production of coal Lancashire vies with Yorkshire, but each is about one-third below Durham. The red hæmatitic iron obtained in the Furness district is also very valuable. In 1885 the amount of pig-iron made in the county was 695,919 tons, in 1890 it was 716,748 tons, in 1895 it was 540,295 tons, and in 1899 it was 744,065 tons. The following table gives the tonnage and value of the fireclay, coal, and iron production in 1890 and 1899:—

Year.	Fireclay.		Coal.		Ironstone.	
	Tons.	Value.	Tons.	Value.	Tons.	Value.
1890	104,080	£14,731	21,707,567	£6,997,566	1,021,990	£447,083
1899	186,503	£23,885	24,857,475	£9,177,416	670,924	£419,909

The fish landed in 1899 at all the Lancashire stations men-tioned in the sea fisheries return (Fleetwood and Liverpool are the chief ports) was 217,092 cwt., valued at £153,411.

(T. F. H.)

Lancaster, a parish, municipal borough (extended 1900), seaport, market town, and county town of Lancashire, England, in the Lancaster parliamentary division of the county, on the Lune, 230 miles north-north-west of London by rail. The grammar-school (rebuilt in 1853), the public baths, the county lunatic asylum, and the Ripley Hospital have been enlarged. A Palatine Hall has been established; the Storey Institute and Art Gallery were made over to the corporation in 1893. Recent erections are new buildings for the Royal Lancaster Infirmary, a sanatorium, and an observatory in the Williamson Park of 40 acres (1881). Glasson dock, on the south side of the Lune estuary, is accessible to vessels of 600 tons, that is, to vessels drawing 12 to 20 feet, and has a graving-dock attached. The port was in 1900 entered and cleared by an aggregate of 1732 vessels of 254,842 tons, the total trade, however, being valued at only £24,500. Area of borough (1891), 1680 acres; population (1881), 20,663; (1891), 31,034. In 1900 the area was extended so as to embrace 3610 acres; population, 40,329.

Lancaster, a city of Ohio, U.S.A., capital of Fairfield county, on the Hocking river, at an altitude of 841 feet. It is on the Cincinnati and Muskingum Valley and the Hocking Valley railways. It is in a natural-gas region, and has varied manufactures, principally of flour and agricultural implements. Population (1890), 7555; (1900), 8991, of whom 442 were foreign-born and 212 were negroes.

Lancaster, a city of Pennsylvania, U.S.A., capital of Lancaster county, on the Conestoga river, at an altitude of 357 feet. It is on four railways, the Cornwall, the Lancaster and Reading, the Pennsylvania, and the Philadelphia and Reading. Its manufacturing interests are large. In 1900 there were 738 manufacturing establishments with a capital of \$10,803,464. They employed 9349 hands, and produced goods valued at \$16,370,281. These consisted in great part of cotton goods, foundry and machine-shop products, clothing, and leather. Franklin and Marshall College, situated here, had in 1899 a faculty of 26 and was attended by 332 students. The assessed valuation of property, real and personal, on a basis of about 75 per cent. of the full value, was, in 1900, \$16,685,148, the net debt of the city was \$764,480, and the rate of taxation was \$17.50 per \$1000. Population (1890), 32,011; (1900), 41,459, of whom 3492 were foreign-born and 777 were negroes.

Lance (Military).—The lance has been used in war in all ages. It was the chosen weapon in the so-called ages of chivalry, and, though somewhat in disfavour in the 17th century, the renown of the Polish Lancers and Cossack cavalry in the 18th and 19th centuries again brought it into fashion. Now many nations, besides having regular Lancer regiments, arm the front ranks at least of all their cavalry regiments with lances.

The lances used in the British service are of two kinds, those with ash and those with bamboo staves. The latter are much preferred and are generally used, the "male" bamboo being peculiarly tough and elastic. The lance (Fig. 1) is provided with a sling, through which the trooper passes his right arm when the lance is carried slung, the point of the steel shoe fitting into a bucket attached to

the right stirrup. A small "dee" loop is also provided, by which the lance can be attached to the saddle when the trooper dismounts. The small flag is removed on service. The head is of the best steel. The Germans, doubtless owing to difficulty in obtaining bamboos, or ash in large quantity straight enough in the grain over a considerable length, for lance staves, have adopted a staff of steel tubing as well as one of pine (Figs. 2, 3, and 4).

The question of the relative efficiency of the lance and the sword as the principal arm for cavalry (*q.v.*) has been much discussed. Thus it is alleged that the former is heavy and fatiguing to carry, conspicuous, and much in the way when reconnoitring in close country, working through woods and the like; that, when

TYPES OF BRITISH AND GERMAN LANCES.

		Length.	Weight about.
Fig. 1	British lance, bamboo staff	9 ft.	4 lbs. 8 ozs.
Figs. 2 and 3	German lance, tubular steel staff	10 ft. 5 ins.	4 lbs.
Fig. 4	" " pine staff	10 ft. 2 ins.	4 lbs. 4 ozs.

Both German lances have a loop, attached by string binding, to take the sling. This loop is attached to the grip, shown in Fig. 2, in the case of the tubular lance.

unslung ready for the charge, it is awkward to handle, and may be positively dangerous if a horse becomes restive and the rider has to use both hands on the reins; that unless the thrust be delivered at full speed, it is easily parried; and, lastly, that in the *mêlée*, when the trooper has not room to use his lance, he will be helpless until he either throws it away, or slings it, and can draw his sword. On the other hand, while admitting the last-mentioned objection, those who favour the lance contend that success in the first shock of contact is all-important, and that this success the lancer will certainly obtain, owing to his long reach enabling him to deliver a blow before the swordsman can retaliate, while, when the *mêlée* commences, the rear rank will come to the assistance of the front rank. Further, it is claimed that the power of delivering the first blow gives confidence to the young soldier; that the appearance of a lancer regiment, preceded as it were by a hedge of steel, has an immense moral effect; that in single combat a lancer, with room to turn, can always defeat an opponent armed with a sword; and, lastly, that in pursuit a lancer is terrible to an enemy, whether the latter be mounted or on foot. As in the case of the perennial argument whether a sword should be designed mainly for cutting or thrusting, it is unlikely that the dispute as

to the merits of the lance over the sword will ever be definitely settled, since so many other factors—horsemanship, the training of the horse, the skill and courage of the adversary—determine the trooper's success quite as much as the weapon he happens to wield. The following passage from *Cavalry: its History and Tactics* (London, 1853), by Captain Nolan, explains how the lance gained popularity in Austria:—"In the last Hungarian war (1848-49) the Hungarian Hussars were . . . generally successful against the Austrian heavy cavalry—cuirassiers and dragoons; but when they met the Polish Lancers, the finest regiments of light horse in the Austrian service, distinguished for their discipline, good riding, and, above all, for their *esprit de corps* and gallantry in action, against those the Hungarians were not successful, and at once attributed this to the lances of their opponents. The Austrians then extolled the lance above the sword, and armed all their light cavalry regiments with it." (H. W. B.)

Landau, a town of Bavaria, Germany, in the Palatinate, on the east side of the Haardt Mountains, 32 miles by rail south-west of Mannheim. There are manufactures of cigars, beer, horsehair goods, tanning, dyeing, gardening, &c., and trade in wine, cereals, tobacco, and groceries. Population (1885), 9395; (1900), 15,823.

Landeck, a town and watering-place of Prussia, province of Silesia, 73 miles by rail south of Breslau (16 miles south-east from Glatz), and close to the Austrian frontier, at an altitude of 1477 feet. It is visited by over 10,000 persons annually for its warm sulphur baths (68°-84.2° F.), which have been known since the 13th century. There are also mud-baths and hydropathics. Population (1900), 3526.

Landes, a department in the south-west of France, bordering on the Atlantic Ocean, traversed by the Adour river.

Area, 3615 square miles. The population has decreased from 302,266 in 1886 to 291,657. There were in 1896, 661 schools, with 38,000 pupils, and 10 per cent. of the population was illiterate. Births in 1899, 6459, of which 401 were illegitimate; deaths, 4929; marriages, 2350. The area under cultivation in 1896 was counted at 1,848,044 acres, but of this surface more than 1,161,000 acres were occupied by the Landes, and only 434,900 acres were plough-land and 44,480 acres vineyards. The land in wheat produced in 1899 the value of £230,000; rye, £288,000; vines, £440,000. The natural pastures yielded a revenue of £322,000. Landes owned in 1899, 32,000 horses, 126,440 cattle, 415,250 sheep, 114,000 pigs, and 23,000 goats. Mining in 1898 produced 750 metric tons of turf and 6900 tons of salt. The industry in metals is, on the other hand, a source of considerable wealth, the department having in 1898 produced 73,500 metric tons of cast iron, 4000 tons of iron, and 50,000 tons of steel, of a total value of £640,000. Of note are also the exportation of resin and the manufacture of alcohol—60,000 gallons in 1899. Mont-de-Marsan, the capital, had a population of 11,604 in 1900.

Landlord and Tenant.—The law of landlord and tenant has been altered and expanded in such a variety of directions since the article in the earlier volumes (ninth edition) of the *Encyclopædia Britannica* appeared, that it seems advisable to take a fresh survey of the field which it covers, assigning special prominence to matters which have arisen subsequently to, or were not emphasized in, the original article. The relationship of landlord and tenant is constituted by a lease, or an agreement for a lease, by assignment, by attornment, and by estoppel. And first of a lease and an agreement for a lease. All kinds of interests and property, whether corporeal, such as lands or buildings, or incorporeal, such as rights of common or of way, may be let. The Benefices Act, 1898, however, now prohibits the grant of a lease of an advowson. Titles of honour, offices of trust or relating to the administration of justice, and pensions granted by the Crown for military services are also inalienable. Generally speaking, any person may grant or take a lease. But to this rule there are a number of common-law and statutory qualifications and exceptions. A lease by or to an infant is voidable at his option. But extensive powers of leasing the property of infants have been created

by the Settled Estates Act, 1877, and the Settled Land Act, 1882. A person of unsound mind can grant or take a lease if he is capable of contracting (see *INSANITY, Legal*). Leases may be made on behalf of lunatics who are subject to the jurisdiction in lunacy under the provisions of the Lunacy Act, 1890, and the Settled Land Act, 1882. A married woman can lease her "separate property" apart from or under the Married Women's Property Acts, as if she were a single woman (*femme sole*). As regards other property, the concurrence of her husband is generally necessary. An alien was at common law incapable of being either a lessor or a lessee. But this disqualification is removed by the Naturalization Act, 1870. The right to deal with the property of a convict while he is undergoing sentence (but not while he is out of prison on leave) is, by the Forfeiture Act, 1870, vested in his administrator. Leases by or to corporations must be by deed under their common seal, and the leasing powers of ecclesiastical corporations in particular are subject to complicated statutory restrictions which cannot here be examined. Powers of granting building and other leases have been conferred by modern legislation on municipal corporations and other local authorities. There are also special rules of law with reference to leases by persons having only a limited interest in the property leased, *e.g.*, a tenant for life under the Settled Land Acts (see the article *SETTLEMENTS* in *Encyclopædia Britannica* [ninth edition], vol. xxi.), or a mortgagor or mortgagee. In order to constitute the relationship of landlord and tenant in the mode under consideration, it is necessary not only that there should be parties capable of entering into the contract, but that there should be a letting, as distinct from a mere agreement to let, and that the right conveyed should be a right to the exclusive possession of the subject of the letting and not a simple licence to use it. Whether a particular instrument is a lease, or an agreement for a lease, or a bare licence, is a question the answer to which depends to a large extent on the circumstances of individual cases; and the only general rule that can be laid down is that in a lease there must be an expression of intention on the part of the lessor to convey, and of the lessee to accept, the exclusive possession of the thing let for the prescribed term and on the prescribed conditions. It is scarcely necessary to add that the landlord must not part with the whole of his interest, since, if he does so, the instrument is not a lease but an assignment. Where a tenant enters under an agreement for a lease and pays rent, the agreement will be regarded as a lease from year to year; and if the agreement is one of which specific performance would be decreed (*i.e.*, if it contains a complete contract between the parties and satisfies the provisions—to be noted immediately—of the Statute of Frauds, and if, in all the circumstances, its enforcement is just and equitable), the lessee is treated as having a lease for the term fixed in the agreement from the time that he took possession under it, just as if a valid lease had been executed. At common law a lease for a term of years (other than a lease by a corporation) might be made by parol. But under the Statute of Frauds leases, except those the term of which does not exceed three years, and in which the reserved rent is equal to two-thirds at least of the improved value of the premises, were required to be in writing signed by the parties or their lawfully authorized agents; and now, under the Real Property Act, 1845, a lease required by law to be in writing is void unless made by deed. The Statute of Frauds also prohibits an action from being brought upon any agreement for a lease, for any term, unless such agreement is in writing and signed by the party to be charged therewith or by some agent lawfully authorized by him.

The following are the principal forms of tenancy:—(i.)

Tenancy for Life.—A lease for life must be made by deed, and the term may be the life of the lessee, the life or lives of some other person or persons, &c. (As to the position of a tenant for life under the Settled Land Acts, see the article SETTLEMENTS in vol. xxi. [ninth edition] of this Encyclopædia.) (ii.) *Tenancy for Years, i.e.*, for a term of years.—This tenancy is created by an express contract between the parties and never by implication, as in the case of tenancy from year to year and tenancy at will. (iii.) *Tenancy from Year to Year*.—This tenancy may be created by express agreement between the parties, or by implication as, *e.g.*, where a person enters and pays rent under a lease for years, void either by law or by statute, or without any actual lease or agreement, or holds over after the determination of a lease whether for years or otherwise. In the absence of express agreement or custom or statutory provision (such as is made by the Agricultural Holdings Act, 1883), a tenancy from year to year is determinable on half a year's notice expiring at the end of some current year of the tenancy. Closely associated with tenancies from year to year are various other tenancies for shorter periods than a year—weekly, monthly, or quarterly, as the case may be. Questions of considerable importance frequently arise as to the notice necessary to terminate tenancies of this character. The issue is one of fact; the date at which the rent is payable is a material circumstance, but it may be said generally that a week's notice should be given to determine a weekly tenancy, a month's to determine a monthly tenancy, and a quarter's to determine a quarterly tenancy.

It is chiefly in connexion with the letting of lodgings, flats, &c., that tenancies of this class arise, and it may therefore be convenient to notice here a few special incidents attaching to them. Where furnished apartments are let for immediate use, the law implies an undertaking on the part of the landlord that they are fit for habitation, and if this condition is broken, the tenant may refuse to occupy the premises or pay any rent. But there is no implied contract that the apartments shall continue fit for habitation during the term of the tenancy, and the rule has no application in the case of a letting of unfurnished lodgings. In the absence of express agreement to the contrary, a lodger has the right to the use of everything necessary to his enjoyment of the premises, such as the door-bell and knocker, and the skylight of the staircase. Whether the rent of furnished apartments can be distrained for where the landlord resides on the premises and supplies attendance, is a question the answer to which is involved in some uncertainty. But a lodger's goods are protected from distress for rent due by an immediate to a superior landlord by the Lodgers' Goods Protection Act, 1871, if the lodger serves the distraining landlord or his bailiff with a written declaration claiming the goods as his property. Where the tenant "holds over" after himself giving notice to quit, the landlord has a statutory right of action for double the rent. *Overcrowding* lodging-houses may be dealt with as a nuisance under the Public Health Acts, 1875 and 1891. (As to the lodger franchise, see article REGISTRATION OF VOTERS.) A lodger is rateable where he is in exclusive occupation of the apartments let to him and the landlord does not retain the control and dominion of the whole structure. There is a considerable body of special law with regard to flats. Thus the occupier of an upper flat has a right to the support of a lower one, although not to the extent of imposing upon the tenant of the latter the duty of actively maintaining such support by repairs. Again, where the only mode of access to a number of residential flats is a common staircase, the landlord is bound to maintain it so as to be a reasonably safe entrance and exit to the tenants and persons doing business with them.

(iv.) *Tenancy at Will*.—A tenancy at will is one which endures at the will of the parties only, *i.e.*, at the will of both, for if a demise be made to hold at the will of the lessor, the law implies that it is at the will of the lessee also and *vice versa*. This form of tenancy, like tenancy from year to year, may be created either by express contract or by implication, as where premises are occupied with the consent of the owner, but without any express or implied agreement as to the duration of the tenancy, or where a house is lent rent free by one person to another.

(v.) *Tenancy at Sufferance*.—A tenant who comes into possession by a lawful demise, but "holds over" or continues in possession after his estate is ended, is said to be a "tenant at sufferance." Properly speaking, tenancy at sufferance is not a tenancy at all, inasmuch as if the landlord acquiesces in it, it becomes a tenancy at will; and it is to be regarded merely as a legal fiction which prevented the rightful owner from treating the tenant as a trespasser until he had himself made an actual entry on or had brought an action to recover the land. The Distress for Rent Act, 1737, however, enables a landlord to recover double rent from a tenant who holds over after having himself given notice to quit; while another statute in the reign of George II. makes a tenant who holds over after receiving notice from his landlord liable to the extent of double the value of the premises. There is no tenancy by sufferance against the Crown.

The component parts of a lease are the parties, the recitals (when necessary) setting out such matters as the title of the lessor; the demise or actual letting (the word "demise" is ordinarily used, but any term indicating an express intention to make a present letting is sufficient); the parcels in which the extent of the premises demised is stated; the *habendum* (which defines the commencement and the term of the lease), the *reddendum* or reservation of rent, and the covenants and conditions. The Conveyancing Act, 1881, provides that, as regards conveyances subsequent to 1881, unless a contrary intention is expressed, a lease of "land" is to be deemed to include all buildings, fixtures, easements, &c., appertaining to it; and, if there are houses or other buildings on the land demised, all out-houses, erections, &c., are to pass with the lease of the land. Covenants in leases may be roughly divided into four groups.

(i.) *Implied Covenants*.—A covenant is said to be implied when it is raised by implication of law without any express provision being made for it in the lease. Thus a lessee is under an implied obligation to treat the premises demised in a tenant-like or "husband-like" manner, and again, where in a lease by deed the word "demise" is used, the lessor probably covenants impliedly for his own title and for the quiet enjoyment of the premises by the lessee.

(ii.) *"Usual" Covenants*.—The term "usual" has a restricted meaning in this connexion, and includes a covenant by the lessor, limited to his own acts and those of persons claiming under or through him, for the "quiet enjoyment" by the lessee of the demised premises, and covenants by the lessee to pay rent, to pay taxes, except such as fall upon the landlord, to keep the premises in repair, and to allow the landlord to enter and view the condition of the premises.

(iii.) *The Covenants running with the Land*.—A covenant is said to "run with the land" when the rights and duties which it creates are not merely personal to the immediate parties (in which case a covenant is said to be "collateral"), but pass also to their assignees. A covenant "runs with the land" if it relates either to a thing *in esse*, which is part and parcel of the demise, *e.g.*, the payment of rent, the repair of houses or fixtures or machinery already built or set up, or to a thing not *in esse* at the time of the demise, but touching the land, provided that the word "assigns" is used in the covenant. As instances of "collateral" covenants, we may take a covenant by a lessor to give the lessee a right of pre-emption over a piece of land adjoining the subject of the demise, or in the case of a lease of a beer-shop, not to keep any similar shop within a prescribed distance from the premises demised, or a covenant by a lessee to pay rates on premises not demised.

(iv.) *Restrictive Covenants*.—These may be subdivided

into two classes—covenants not to assign or underlet without the lessor's consent (it may be noted in passing that such consent must be applied for even if, under the covenant, it cannot be withheld); and covenants in restraint of trade, *e.g.*, not to use the demised premises for certain trading purposes, and in the case of "tied houses" a covenant by the lessees to purchase all beer required from the lessors.

In addition to those above noted, a lease frequently contains covenants for removal of the lease at the option of the lessee, and for repairs or insurance against damage by fire by the lessee. Leases frequently contain a covenant by the lessee to bear and pay rates, taxes, assessments, and other "impositions" or "charges," or "duties" or "outgoings," or "burdens" (except property tax) imposed upon the demised premises during the term. Considerable difficulty has arisen in recent years as to the scope of the terms "impositions," "charges," "duties," "outgoings," "burdens." The words "rates, taxes, assessments" point to payments of a periodical or recurring character. Are the latter words in such covenants limited to payments of this kind, or do they include single and definite payments demanded, for example, by a local authority, acting under statutory powers, for improvements of a permanent kind affecting the premises demised? The decisions on the point are numerous and difficult to reconcile, but the main test is whether, on the true construction of the particular covenant, the lessee has undertaken to indemnify the landlord against payments of all kinds.

There are several special points in connexion with rent that deserve to be noted. The amount of rent must be ascertained or ascertainable. There must also

Rent. be certainty as to the time of payment. If a tenant pays his rent before the day on which it is due, he runs the risk of being called upon, in certain circumstances, to pay it over again. Such a payment is an advance to the landlord subject to an agreement that when the rent becomes due the advance shall be treated as a fulfilment of the tenant's obligation to pay rent. The payment is therefore, generally speaking, a defence to an action by the landlord or his heirs. But if the landlord mortgages his reversion, either before or after the advance, the assignee will, by giving notice to the tenant before the proper rent day to pay rent to him, become entitled to the rent then falling due. A tenant is not in arrears with his rent until after midnight on the day on which it is due. Payment by cheque is conditional payment only, and if the cheque is dishonoured, the original obligation revives. Where a cheque in payment of rent is lost in the course of transmission through the post, the loss falls on the tenant unless the landlord has expressly or impliedly authorized it to be forwarded in that way; and the landlord's consent to take the risk of such transmission will not be inferred from the fact that payments were ordinarily made in this manner in the dealings between the parties. A tenant may deduct from his rent (i.) "landlord's taxes," *e.g.*, property-tax paid by the tenant, if, as is usual, the statute imposing the tax authorizes the deduction; the deduction should be made from the rent next due after the payment. (ii.) Taxes or rates which the landlord had undertaken to pay, but had not paid—payment having thereupon been made by the tenant. (iii.) Payments made by the tenant which ought to have been made by the landlord, *e.g.*, rent due to a superior landlord. (As to the apportionment of rent, see APPORTIONMENT.) A right of distress is incident to rent. The latest statutory development of the law on this subject is the Law of Distress Amendment Act, 1888. This statute confers absolute privilege from distress upon the wearing apparel and "bedding"—a term which includes "bedstead"—of

the tenant or his family, and the tools and implements of his trade to the value of £5. The Act does not apply to cases where the interest of the tenant has expired, and where possession of the premises has been demanded, and where distress is made not earlier than seven days after such demand. Under this Act also, distress, unless made by the landlord in person, must be made by a bailiff duly certificated (see the Distress for Rent Rules, 1888 and 1895). The Law of Distress Amendment Act, 1895, supplements the Act of 1888, and in particular gives county court judges wider powers of dealing with the certificates of bailiffs. Rent is also recoverable by action, which must be brought within twenty years after the cause of action has arisen, or after an acknowledgment by the party liable, or his agent, or part payment if the rent is reserved by a lease under seal, and in other cases within six years.

The relationship of landlord and tenant may be altered either voluntarily, by the act of the parties, or involuntarily, by the operation of law, and may also be dissolved. The principal mode of voluntary **Termination.** alteration is an assignment either by the tenant of his term or by the landlord of his reversion. An assignment which creates, it will be observed, the relationship of landlord and tenant between the lessor or lessee and the assignee, must be by deed, but the acceptance by a landlord of rent from a tenant under an invalid assignment may create an implied tenancy from year to year; and similarly payment of rent by a tenant may amount to an acknowledgment of his landlord's title. This is one form of tenancy by estoppel. The principle of all tenancies of this kind is that something has been done by the party estopped, amounting to an admission which he cannot be allowed to contradict. "Attornment," or the agreement by a tenant to become tenant to a new landlord, is a term now often used to indicate an acknowledgment of the existence of the relationship of landlord and tenant. It may be noted here that it is still common to insert in mortgage deeds what is called an "attornment clause," by which the mortgagor "attorns" tenant to the mortgagee, and the latter thereupon acquires a power of distress as an additional security. If the lands assigned are situated in Middlesex or Yorkshire, the assignment should be registered under the Middlesex Registry or Yorkshire Registries Acts, as the case may be; and similar provision is now made for the registration by an assignee of his title under the Lands Transfer Acts, 1875 and 1897. Another form of alteration in a contract of tenancy is an under-lease, which differs from assignment in this—that the lessor parts with a portion of his estate instead of, as in assignment, with the whole of it. There is no privity of contract between an under-lessee and the superior landlord, but the latter can enforce against the former restrictive covenants (*v. sup.*) of which he had notice. The contract of tenancy may also be altered by operation of law. If a tenant becomes bankrupt, his interest passes to his trustee in bankruptcy—unless, as is frequently the case, the lease makes the occurrence of that contingency determine the lease. So on the death of a tenant his interest passes to his legal representatives. Tenancy is dissolved by the expiry of the term for which it was created—a subject which has already been sufficiently touched upon in considering the various kinds of tenancy—or by forfeiture of the tenant's interest on the ground of the breach of some condition by the tenant and re-entry by the landlord. A breach of condition may, however, be waived by the landlord, and the legislature has made provision for the relief of the tenant from the consequences of such breaches in certain cases. Relief from forfeiture and rights of re-entry are now regulated chiefly by the Conveyancing Acts, 1881 and

1892. Under these Acts a right of re-entry or forfeiture is not to be enforceable unless and until the lessor has served on the lessee a written notice specifying the breach of covenant or condition complained of, and requiring him to remedy it or make compensation, and this demand has not within a reasonable time been complied with; and when a lessor is proceeding to enforce such a right the court may, if it think fit, grant relief to the lessee.

Reference may be made, in conclusion, to a few modern statutes which have affected the law of landlord and tenant. The Agricultural Holdings Acts, 1883 (which repeals the Agricultural Holdings Act, 1875) and 1900, give to the agricultural tenant a right to compensation for (i.) certain specified improvements made by him with the landlord's previous consent in writing; and (ii.) certain other classes of improvements although the landlord's consent has not been obtained. As examples of class (i.) may be mentioned—erection or enlargement of buildings, laying down of permanent pasture, making of gardens or fences, planting of hops, embankments, and sluices; as examples of (ii.)—chalking of land, clay burning, application to land of purchased artificial or purchased manure. In the case of proposed drainage improvements, however, notice in writing must be given to the landlord, who may then execute the improvements himself and charge the tenant with interest not exceeding 5 per cent. per annum on the outlay, or such annual instalments, payable for a period of twenty-five years, and recoverable as rent, as will repay the outlay, with interest at the rate of 3 per cent. a year. An agricultural tenant may not contract himself out of his statutory right to compensation, but "contracting out" is apparently not prohibited with regard to the right given him by the Acts of 1883 and 1900 to remove fixtures which he has erected and for which he is not otherwise entitled to compensation, after reasonable notice to the landlord, unless the latter elects to purchase such fixtures at a valuation. The Allotments and Cottage Gardens (Compensation) Act, 1887, deals, on terms similar to those of the Agricultural Holdings Acts, 1883 and 1900, with allotments (*i.e.*, parcels of land of not more than two acres, cultivated as gardens or farms, or partly as gardens and partly as farms) and cottage gardens (*i.e.*, allotments attached to cottages); and where a tenant is entitled to "compensation" under the Act of 1887 he is not to be so entitled under the Act of 1883 (Tenants' Compensation Act, 1890). Compensation is given to market gardeners for unexhausted improvements by the Market Gardeners' Compensation Act, 1895. The Agricultural Holdings Act, 1883, the Tenants' Compensation Act, 1890, the Market Gardeners' Compensation Act, 1895, and the Agricultural Holdings Act, 1900, may now (by § 14 (2) of the last-named statute) be cited together as the Agricultural Holdings (England) Acts, 1883 to 1900.

Scotland.—The following statutes relating to the law of landlord and tenant in Scotland must be noted. The Agricultural Holdings (Scotland) Acts, 1883 and 1900, contain provisions—similar to those of the English Acts—as to a tenant's right to compensation for unexhausted improvements, removal for non-payment of rent, notice to quit at the termination of a tenancy, and a tenant's property in fixtures. The Crofters' Holdings (Scotland) Acts, 1886, 1887, and 1888, confer on "crofters" special rights. A crofter is defined as "a tenant of a holding"—being arable or pasture land, or partly arable and partly pasture land—"from year to year who resides on his holding, the annual rent of which does not exceed £30 in money, and which is situated in a crofting parish." Nearly all the parishes in Argyll, Inverness, Ross, Cromarty, Sutherland, Caithness, and Orkney and Shetland answer to this description. The crofter enjoys a

perpetual tenure subject to the fulfilment of certain conditions as to payment of rent, non-assignment of tenancy, &c., and to defeasance at his own option on giving one year's notice to the landlord. A Crofters' Commission constituted under the Acts has power to fix fair rents, and the crofter on renunciation of his tenancy or removal from his holding is entitled to compensation for permanent improvements. The Small Holdings Act, 1892, applies to Scotland.

Ireland.—The history and condition of the law of landlord and tenant in Ireland down to and including the year 1881 will be found stated in the article IRELAND in vol. xiii. (ninth edition) of the *Encyclopædia Britannica*. The first important statute after that date was the Land Purchase Act of 1885 (Lord Ashbourne's Act). It enabled the Land Commission, established under the Land Act, 1881, to advance to tenants out of a grant of £5,000,000, which it made to the Land Commission for the purpose, the whole money required for the purchase of their holdings (under the Land Act, 1881, the limit of an advance was three-fourths of the purchase money), if provision were made for the lodgment or retention of a guarantee deposit; and the sale might be carried out by a vesting order of the Land Commission in lieu of a conveyance. The advance was made repayable by an annuity in favour of the Land Commission of £4 for every £100, and so in proportion for any less sum. Amending Acts were passed in 1887, 1888, 1891, and 1896. The Land Act, 1887, enabled all leaseholders to obtain a judicial revision of their rents; all middlemen, *i.e.*, leaseholders who had sublet their lands, were allowed, if the courts reduced the rents of their tenants, to throw up their leases; power was given to the landlord who had obtained judgment of eviction to make his tenant a caretaker without first evicting him. An equitable jurisdiction was vested in the county court to hear complaints from tenants, to give them time for the payment of their rents, when that should be necessary, and when they were honestly insolvent to relieve them—in like manner as under the bankruptcy law—from all or part of their debts, including rent, and in proper cases to reinstate them in their holdings at a fair rent. The Land Act, 1888, increased the grant placed at the disposal of the Land Commission by Lord Ashbourne's Act from £5,000,000 to £10,000,000. The Land Purchase Act, 1891, besides providing for the relief of "congested districts" (which were also the subject of legislation in 1893 and 1894) and the allocation of the money to be lent for land purchase, created ingenious machinery for enabling British credit to be applied in the extension of the system of land purchase. When a landlord and tenant agree on the sale of a holding—the measure is entirely permissive in character—and when the Land Commission has sanctioned the advance, the advance is made to the landlord not in cash but in the issue of guaranteed land stock of the nominal amount of the advance, producing dividends at the rate of $2\frac{3}{4}$ per cent. In order to provide for the payment of these dividends and for the redemption of the whole amount in forty-nine years, the tenant pays a purchase annuity for that period, the normal rate of which is 4 per cent. for the advance, but which is fixed at a higher rate during the earlier years of the term so as to provide a tenants' insurance fund. The purchase annuities are paid into a land purchase account, and any deficiency in the payment either of interest or of capital is temporarily advanced out of the Consolidated Fund, which is in turn recouped for these temporary advances out of a guarantee fund, consisting of (i.) a cash portion—the Irish Probate Duty Grant, the annual exchequer contribution, and (a provision abolished by the Land Act, 1896) the county percentage—and (ii.)

a contingent portion including the Irish share of the local taxation (Customs and Excise) duties and various local grants. The Land Act, 1896, required the court in fixing a fair rent for a holding to ascertain and record in the form of a schedule, *inter alia*, the condition as to deterioration, cultivation, or otherwise of the holding and any buildings on it, the improvements made at the cost of the tenant and those made at the cost of the landlord, defined the tenures excluded from its provisions as to fair rents, altered to some extent the mode of calculating the annuity payable by the tenant, amended the law as to the guarantee deposit, and provided that where an order had been made for a sale of an estate or it had been placed in the hands of a receiver the land judge might, after reference to the Land Commission, offer it for sale to the tenants, but the offer was not to be accepted until all parties had been fully heard and all the circumstances had been considered.

The law of landlord and tenant in the United States is in its principles similar to those of English law. The relationship of landlord and tenant is created, altered, and dissolved in the same way, and the rights and duties of parties are similar. An excellent summary of the law will be found in Bouvier's *Law Dictionary* (ed. Rawle, 1897), *s.v.* "Landlord and Tenant." As to India, see INDIA in vol. xii. (ninth edition) of the *Encyclopædia Britannica*. The laws of the various colonies on the subject are too numerous and too different to be dealt with here. But there has been a general tendency in recent years to copy modern English statutory developments, as in limiting the right of distress (see No. 1388 of 1895—Victoria—and *cp.* C. 17 of 1895, and C. 18 of 1896—British Columbia), securing the protection of lodgers' goods (No. 2 of 1898—West Australia, and No. 5 of 1898—Grenada), and in securing compensation to tenants (see No. 11 of 1897—Barbados).

(A. W. R.)

Land Registration in its two forms—registration of deeds and registration of title—may be best described as a species of machinery for assisting a purchaser or mortgagee in his inquiries as to his vendor's or mortgagor's title previously to completing his dealing, and for securing his own position afterwards. The expediency of making some inquiry into the vendor's title before completing a purchase of land (and the case of a mortgage is precisely similar) is so obvious as hardly to need demonstration. Goods, it is true, are ordinarily bought and sold without any inquiry of this nature, but there is very little analogy between the two cases. In the case of goods, possession may ordinarily be relied on as proof of full ownership; in the case of land, the person in ostensible possession is very seldom the owner, being usually only a tenant, paying rent to some one else. Even the person to whom the rent is paid is in many cases—probably, in England, in most cases—not the full owner, but only a life owner, or a trustee, whose powers of disposing of the property are of a strictly limited nature. Again, goods are very seldom the subject of a mortgage, whereas land has from time immemorial been the frequent subject of this class of transaction. Evidently, therefore, some sort of inquiry is necessary to enable a purchaser to obtain certainty that the land for which he pays full price is not subject to an unknown mortgage or charge, which, if left undiscovered, might afterwards deprive him of a large part or even the whole of its value. Again: the probability of

serious consequences to the purchaser ensuing from a mistake as to title is infinitely greater in the case of land than in the case of goods. Before the rightful owner can recover misappropriated goods, he has to find out where they are. This is usually a matter of considerable difficulty. By the time they have reached the hands of a *bonâ fide* purchaser all chance of their recovery by the true owner is practically at an end. But with land the case is far otherwise. A dispossessed rightful owner never has any difficulty in tracing his property, for it is immovable. All he has to do is to bring an action for ejectment against the person in possession. For these reasons, among others, it may safely be said that any attempt to deal with land on the simple and unsuspecting principles which obtain in regard to goods would be fraught with grave risks.

Apart from very early and primitive social conditions, when everybody's affairs were more or less within the common knowledge of everybody else, there appear to be only two ways in which the required certainty as to title to land can be obtained. Either the purchaser must satisfy himself, by an exhaustive scrutiny and review of all the deeds, wills, marriages, heirships, and other documents and events by which the property has been conveyed, mortgaged, leased, devised, or transmitted during a considerable period of time, that no loophole exists whereby an adverse claim can enter or be made good—this is called the system of private investigation of title—or the Government must keep an authoritative list, or register, of the properties within its jurisdiction, together with the names of the owners and particulars of the encumbrances in each case, and must protect purchasers and others dealing with land, on the faith of this register, from all adverse claims. This second system is called Registration of Title. To these two alternatives may perhaps be added a third, of very recent growth—Insurance of Title. This is largely used in the United States. But it is in reality only a phase of the system of private investigation. The insurance company investigates the title according to a method of its own, and charges the purchaser a premium to cover the expense and the risk of error. Registration of deeds is an adjunct of the system of private investigation, and, except in England, is a practically invariable feature of it. It consists in the establishment of public offices, in which all documents affecting land are to be recorded—partly in order to preserve them in a readily accessible place, partly in order to prevent the possibility of any material deed or document being dishonestly concealed by a vendor from the scrutiny of the intending purchaser. Where registration is effected by depositing a full copy of the deed, it also renders the subsequent falsification of the original document dangerous. Registration of deeds does not (except perhaps to a certain extent indirectly) cheapen or simplify the process of investigation—the formalities at the registry add something to the trouble and cost incurred—but it prevents the particular classes of fraud above mentioned.

The history of land registration follows, as a general rule, a fairly uniform course of development. In very early times, and in small and simple communities, the difficulty which is afterwards found in establishing title to land does not arise, owing to the primitive habit of attaching a certain amount of ceremony and publicity to all dealings. The parties meet on the land, with witnesses; symbolical acts (such as handing over a piece of earth, or the bough of a tree) are performed; and a set form of words is spoken, expressive of the intention to convey. By this means the ownership of each estate in the community becomes to a certain extent a matter of common knowledge, rendering fraud and mistake difficult.

But this method leaves a good deal to be desired in point of security. Witnesses die, and memory is uncertain; and one of the earliest improvements consists in the establishment of a sort of public record kept by the magistrate, lord, or other local authority, containing a series of contemporary notes of the effect of the various transactions that take place. This book becomes the general title-deed of the whole community, and as long as transactions remain simple, and not too numerous, the results appear to be satisfactory. Of this character are the Manorial Court Rolls, which were in the Middle Ages the great authorities on title, both in England and on the Continent. The entries in them in early times were made in a very few words. The date, the names of the parties, the name or short verbal description of the land, the nature of the transaction, are all that appear. In the land registry at Vienna there is a continuous series of registers of this kind going back to 1368, in Prague to 1377, in Munich to 1440. No doubt there are extant (though in a less easily accessible form) manorial records in England of equal or greater antiquity. This may be considered the first stage in the history of Land Registration. It can hardly be said to be in active operation at the present day in any civilized country—in the sense in which that term is usually understood. Where dealings become more numerous and complicated, written instruments are required to express the intentions of the parties, and perform the further function afterwards of supplying evidence of the landowner's title. It appears, too, that as a general rule the public books already described continue to be used, notwithstanding this change; only (as would be expected) the entries in them, once plain and simple, either grow into full copies of the long and intricate deeds, or consist of mere notes stating that such and such deeds have been executed, leaving the persons interested to inquire for the originals, in whose custody soever they may be found. This system, which may be regarded as the second stage in the history of land registration, is called Registration of Deeds. It prevails in France, Belgium, parts of Switzerland, in Italy, Spain, India, in almost all the British colonies (except Australasia and Canada), in most of the states of the American Union, in the South American republics, in Scotland and Ireland, and in the English counties of Yorkshire and Middlesex. Where it exists, there is generally a law to the effect that in case of dispute a registered deed shall prevail over an unregistered one. The practical effect of this is that a purchaser can, by searching the register, find out exactly what deeds he ought to inquire for, and receives an assurance that if, after completion, he registers his own conveyance, no other deeds—even if they exist—will prevail against him.

The expenses and delays, not to mention the occasional actual losses of property through fraud or mistake, attendant on the system of making every purchaser responsible for the due examination of his vendor's title—whether or not assisted by registration of deeds—have ultimately induced several Governments to establish the more perfect system of Registration of Title, which consists in collecting the transactions affecting each separate estate under a separate head, in keeping an accurate account of the parcels of which each such estate is composed, and summarizing authoritatively, as each fresh transaction occurs, the subsisting rights of all parties in relation to the land itself. This system prevails in Germany, Austria, Hungary, parts of Switzerland, the Australasian colonies, nearly the whole of Canada, some of the states of the American Union, to a certain extent in Ireland, and is in course of establishment in England and Wales. The Register consists of three portions:—(1) The description of the land, now always accompanied by a reference to a map; (2) the ownership,

giving the name and address of the person who can sell and dispose of the land; and (3) the encumbrances, in their order of priority, and the names of the persons for the time being entitled to them. When any fresh transaction takes place the instrument effecting it is produced, and the proper alterations in, or additions to, the register are made: if it be a sale, the name of the vendor is cancelled from the register, and that of the purchaser is entered instead; if it be a mortgage, it is added to the list of encumbrances; if a discharge, the encumbrance discharged is cancelled; if it is a sale of part of the land, the original plan is marked to show the piece conveyed, while a new plan is made and a new register is opened for the detached parcel. In the English and Australian registries a "land certificate" is also issued to the landowner containing copies of the register and of the plan. This certificate takes the place more or less of the old documents of title. On a sale, the process is as follows. The vendor first of all produces to the purchaser his land certificate, or gives him the number of his title and an authority to inspect the register. In Austria and in some colonial registries this is not necessary, the register being open to public inspection, which in England is not the case. The purchaser, on inspecting this, can easily see for himself whether the land he wishes to buy is comprised in the registered plan, whether the vendor's name appears on the register as the owner of the land, and whether there are any encumbrances or other burdens registered as affecting it. If there are encumbrances, the register states their amount and who are entitled to them. The purchaser then usually¹ prepares a conveyance or transfer of the land (generally in a short printed form issued by the registry), and the vendor executes it in exchange for the purchase money. If there are mortgages, he pays them off to the persons named in the register as their owners, and they concur in a discharge. He then presents the executed instruments at the registry, and is entered as owner of the land instead of the vendor, the mortgages, if any, being cancelled. Where "land certificates" are used (as in England and Australia), a new land certificate is issued to the purchaser showing the existing state of the register and containing a copy of the registered plan of the land. The above is of course only a brief outline of the processes employed. For further information as to practical details reference may be made to the treatises mentioned at the end of this article. The following particulars indicating the history and distinctive features of different systems prevailing in Great Britain and various other countries may, however, prove interesting:—

England and Wales.—In England and Wales land registration is as yet (1902) only partially established. Since the time of Queen Anne deed registries have existed in Middlesex and Yorkshire, and under Lord Halsbury's Land Transfer Act of 1897 considerable progress has been made in compiling a register of title in the county of London, but it will probably be some years before this measure will have attained its full effect. The Act of 1897, § 20, provides the means of gradually extending the system throughout the country on the initiative of the County Councils. The first attempt to introduce general registration of conveyances appears to have been made by the Statute of Enrolments, passed in the 27th year of Henry VIII. But this was soon found to be capable of evasion, and it became a dead letter. A Registration Act applying to the counties of Lancaster, Chester, and Durham was passed in Queen Elizabeth's reign, but failed for want of providing the necessary machinery for its observance. The subject reappeared

¹ In Prussia all conveyances are verbal, made in person or by attorney before the registrar, who forthwith notes them in his books.

in several Bills during the Commonwealth, but these failed to pass, owing, it would seem, to the objection of landowners to publicity. In 1669 a committee of the House of Lords reported that one cause of the depreciation of landed property was the uncertainty of titles, and proposed registration of deeds as a remedy, but nothing was done.

During the next thirty years numerous pamphlets for and against a general registry were published. In 1704 the first Deed Registry Act was passed, applying to the West Riding of Yorkshire. In 1707 the system was extended to the East Riding, and in 1708 to Middlesex. These Middlesex and Yorkshire registries remain in operation to the present day, and are greatly valued by the smaller proprietors and mortgagees, owing to the security against fraud which they provide at a trifling cost. The selection of these counties seems capricious: its probable explanation is that in them trade was flourishing, and the fortunes made were frequently invested inland, and a protection against secret encumbrances was most in demand. In 1728 and 1732 Surrey and Derby petitioned, unsuccessfully, for local registries. In 1735 the North Riding Deed Registry Act was passed. In 1739 a General Registry Bill passed the Commons, but did not reach the Lords. Next year the Lords passed a similar Bill, but it did not reach the Commons. In 1759 a General Registry Bill was thrown out by a majority of one. In 1785 Northumberland unsuccessfully petitioned for a local registry. After this the subject went almost out of sight till the Real Property Commission of 1828. They reported in 1830 in favour of a general register of deeds, but though several Bills were introduced, none were passed. In 1846 a committee of the House of Lords reported that the marketable value of real property was seriously diminished by the tedious and expensive process of the transfer of land, and that a registry of title to all real property was essential to the success of any attempt to simplify the system of conveyancing. In 1850 a Royal Commission reported in favour of a general register of deeds, and in 1851 Lord Campbell introduced a Bill accordingly, but it was opposed, and was dropped. In 1853 Lord Cranworth introduced a Bill, which passed the Lords but not the Commons. Hitherto only registration of deeds had been considered, but in 1854 a new Royal Commission was appointed, which reported in 1857 in favour of a register of title. The scheme they recommended was substantially embodied in a Bill introduced in 1859 by Lord Cairns—then Solicitor-General—but a dissolution stopped its progress. In 1862 Lord Westbury had the satisfaction of carrying the first Act for registration of title. This Act enabled any landowner to register an indefeasible title on production of strict proof. The proof required was to be such as the Court of Chancery would force an unwilling purchaser to accept. Only a few hundred titles were registered under this Act, and in 1868 a Royal Commission was appointed to inquire into the causes of its failure. They reported in 1870, making various suggestions of detail, and especially advertent to the great expense caused by the strictness of the official investigation of title before a property could be admitted to the register at all. In the same year Lord Hatherley introduced a Transfer of Land Bill, but it was not proceeded with. In 1873 Lord Selborne introduced a Land Titles and Transfer Bill, following more or less the recommendations of the report of 1870, proposing for the first time compulsory registration of title upon every next sale after a prescribed date. Lord Cairns again introduced this Bill (with some modifications) in 1874, but it had to be dropped. In 1875 Lord Cairns's Land Transfer Act of that year was passed, which was much the same as the former Bill, but without compulsion. This Act had no

better success than the Act of 1862, but as its adoption has since been made compulsory, its provisions are important. Its most noticeable feature from a practical point of view is the additional prominence given to an expedient called "Possessory" registration (which also existed under another name in Lord Westbury's Act), whereby is removed the great initial difficulty of placing titles on the register in the first instance. Two sorts of registration were established, "Absolute" and "Possessory." The effect of an absolute registration was immediately to destroy all claims adverse to the registered title. But this was only to be granted on a regular investigation of title, which, though not so strict as under the former Act, yet necessarily involved a certain amount of time and cost. Possessory registration, on the other hand, was to be granted to any one who could show a *prima facie* title—a quick and cheap process. But the effect of such registration would not be immediately felt. It would not destroy existing claims. It would only prevent new difficulties from arising. In course of time such a title would be practically as good as an absolute one. In 1885 the Duke of Marlborough introduced a Bill for a registry of titles, and in the following vacation Lord Davey wrote three letters to *The Times* advocating the same thing on the general lines afterwards adopted.¹ In 1887 Lord Halsbury, by introducing his Land Transfer Bill, commenced a struggle with the opponents of reform, which, after ten years of almost continuous effort, resulted in the passing of his Act of 1897, establishing compulsory registration of title. Without going into the details of this protracted campaign, suffice it to say that Lord Halsbury introduced Bills in 1887, 1888, and 1889. Lord Herschell, who succeeded him after the change of Government, introduced Bills in 1893, 1894, and 1895, these last three being unanimously passed by the House of Lords on every occasion. The Bill of 1895 reached committee in the Commons, but was stopped by the dissolution of Parliament. In 1897 Lord Halsbury (who had meanwhile returned to the Woolsack) again introduced the same Bill with certain modifications which caused the Incorporated Law Society to withdraw its opposition in the House of Commons, and the Act was finally passed on the last day of the session. Under it the Privy Council has power to issue orders from time to time declaring that on a certain date registration of title is to be compulsory on sale in a given district. The effect of such an order is to oblige every purchaser of land in the district after that date to register a "possessory title," as above described, immediately after his purchase. The compulsory provisions of the Act extend to freeholds and (by a rule afterwards made) to leaseholds having forty years to run. No order except the first can be made, save on the request of a county council. The first order was made in July 1898. It embraces the whole administrative county of London (including the City of London), proceeding gradually by groups of parishes. Under this order upwards of 32,000 titles have already been registered, representing a value exceeding thirty millions sterling. The cost of originally registering a possessory title, or a subsequent transfer or charge of registered land, is regulated according to the value of the land or charge, and is as follows:—

Value.	Fee.
Up to £1000	1s. 6d. per £25 value.
Thence to £3000	£3 for the first £1000, and then 1s. per £25.
Thence to £10,000	£7 for the first £3000, and then 1s. per £50.
Over £10,000	£14 for the first £10,000, and then 1s. per £100, up to a maximum of £25 for £32,000 value and over.

¹ This summary is an abridgment (with permission) of pp. 7 to 26 of Mr R. Burnet Morris's book referred to at the end of this article.

Under the operation of this Act, at the expense of a somewhat increased cost on all transactions during a few years, persons dealing with land in the county will ultimately experience great relief in the matter both of cost and of delay. Mortgagees will also be protected from risks of fraud, which at present are very appreciable, and of which the Redgrave case is a recent example.

Scotland.—In Scotland registration of *deeds* was established by an Act of 1617, which remained unaltered till 1845. There are also Acts of 1868 and 1874. The registry is in Edinburgh. Deeds are registered almost invariably by full copy. The deeds are indexed according to properties—each property having a separate number and folio called a “search sheet,” on which all deeds affecting it are referred to. In 1893, 34,767 deeds were registered and 2000 official searches were made. The consequence of the existence of this register is to render fraud in title absolutely unknown. Forty years is the usual period investigated. The investigation can, if desired, be made from the records in the registry alone. The fees are trifling, but suffice to pay the expenses of the office, which in 1893 employed no less than seventy-five permanent clerks in addition to temporary assistants. The total costs of conveyancing amount, roughly speaking, to between 1 and 2 per cent. on the purchase money, and are equally shared between vendor and purchaser.

Australia and New Zealand.—These colonies now furnish the most conspicuous examples in the British Empire of the success of registration of *title*. But prior to the year 1857 they had only registration of *deeds*, and the expense, delay, and confusion resulting from the frequent dealings appear to have been a crying evil. The late Sir Robert Torrens, then registrar of deeds in South Australia, drew up and carried an Act establishing a register of title similar to the shipping register. The Act rapidly became popular, and was adopted (with variations) in all the other Australasian colonies in the years 1861, 1862, 1870, and 1874. Consolidating and amending Acts have since been passed in most of these colonies. Only absolute title is registered. All land granted by Government, after the passing of the several Acts, is placed on the register compulsorily. But voluntary applications are also made in very large numbers. It is said ordinary purchasers will not buy land unless the vendor first registers the title. The fees are very low—£1 to £3 is a usual maximum—though in some colonies, *e.g.*, Victoria, the fees rise indefinitely, *ad valorem*, at a rate of about 10s. per £1000. Insurance funds are established to provide compensation for errors. At a recent date they amounted to over £400,000, while only £14,600 odd had been paid in claims. All the registries pay their own expenses. Bankers and men of business generally are warm in their appreciation of the Acts, which are popularly called Torrens Acts, after their originator, who, though not a lawyer, originated and carried through this important and difficult legal work.

Canada.—Registration of *title* was introduced in Vancouver Island in 1861, was extended to the rest of British Columbia in 1870, and was in 1885 adopted by Ontario, Manitoba, and the North-West Territories. Only Quebec, Nova Scotia, New Brunswick, and Prince Edward Island (all in the extreme east) retain the old English system, plus registration of deeds. The three provinces which have adopted registration of title have adopted it in somewhat different forms. In British Columbia it is similar to Lord Westbury's Act of 1862. The North-West Territories follows closely the Torrens Acts. The Ontario Act is almost a transcript of Lord Cairns's Act of 1875. The fees again are very low, seldom exceeding

a few shillings, but all expenses of the office are paid from this source. The Ontario registry has five district offices, as well as the central one at Toronto. This is apparently the only colonial registry which is not open to public inspection.

Other British Colonies.—In the other British colonies private investigation of title, plus registration of deeds, is the prevailing system, but registration of title has been introduced in one or two instances.

Germany and Austria-Hungary.—By far the most important examples of registration of *title* at present existing—because they show how the system works when applied to large European communities, with all the intricacies and complications of modern civilized life—are to be found in Germany and Austria-Hungary. In some parts of these countries Registration of Title has been established for several centuries—notably in Bohemia; in most parts it has existed for the greater part of the 19th century; in some districts, again, notably Tirol and the Rhine Provinces, it is still in course of introduction. In all cases it appears to have been preceded by a system of deed registration, which materially facilitated its introduction. In some cases, Prussia, for instance, the former registers were kept in such a way as to amount in themselves to little short of a registry of title. Very low scales of fees suffice to pay all official expenses. In Prussia, for instance, the fees for registering sales begin at 5d. for a value of £1; at £20 the fee is 2s. 7d.; at £100 it is 7s. 3d.; at £1000 it is £1, 10s.; at £5000, £4, 5s., and so on. In case of error, the officials are personally liable; failing these, the state. Other states are very similar. In 1894, 1,159,995 transactions were registered in Prussia. In 1893, 938,708 were registered in Austria. Some idea of the extent to which small holdings prevail in these countries may be gathered from the fact that 36 per cent. of the sales and mortgages in Austria were for under £8, 6s. 8d. value—74 per cent. were for under £50. Owing to the ease and simplicity of the registers, it is not always necessary to employ professional help. When such help is required, the fees are low. In Vienna £1 is a very usual fee for the purchaser's lawyer. £10 is seldom reached. In Germany the register is private. In Austria it is open to public inspection. In these registers may be found examples of large estates in the country with numerous charges and encumbrances and dealings therewith; peasants' properties, in numerous scattered parcels, acquired and disposed of at different times, and variously mortgaged; town and suburban properties, flats, small farms, rights to light and air, rights of way, family settlements, and dealings of all sorts—inheritorships and wills, partitions, bankruptcies, mortgages, and a great variety of dealings therewith. The Continental systems are usually administered locally in districts, about 20 to 30 miles across, attached to the local law courts. In Baden and Würtemberg every parish (*commune*) has its own registry. All ordinary dealings are transacted with the greatest expedition. Security is absolute.¹

The United States.—Up to a late date the ordinary English system, with registration of *deeds*, was universal in the United States. The registries appear to go back practically to the original settlement of the country. Registration is by full copy. It is said that in the large towns the name indexes were often much overgrown owing to the want of subdivision into smaller areas corresponding to the parishes into which the Middlesex and Yorkshire indexes are divided. In the New York registry not many years ago 25,000 deeds were registered annually. At the same time 35,000 were registered in Middlesex. Com-

¹ Full information as to the German and Austrian systems is to be found in a Parliamentary Report of 1896 (C.—8139) on the subject.

plaints are made by American lawyers of want of accuracy in the indexes also. In 1890 an Act was passed in New York for splitting the indexes into "blocks," which is expected to give much relief in a few years' time. The average time and cost of an examination of title, as estimated by a committee of the Bar Association of New York in 1887, was about thirty days and 150 dollars (about £30). A later State Commission in Illinois estimates the law costs of a sale there at about 25 dollars (£5); the time may run into many months. Allusion has already been made to the insurance of title companies. The rates of insurance are substantial, e.g., 65 dollars (£13) on the first 3000 dollars (£600), and 5 dollars (£1) on each additional 1000 dollars (£200). This would amount to £20 on £2000 value, £110 on £20,000, £510 on £100,000. The guarantee given is very ample, and may be renewed to subsequent owners at one-third of the fee. Registration of title has lately been introduced into Illinois, but the practical results have hardly as yet had time to declare themselves.

France.—In France registration of *deeds* is universal. Sales, mortgages, gifts, and successions; easements, leases of over eighteen years, and transactions affecting the land to the extent of three years' rent, may lose priority if not registered. Wills need not be registered. Mortgages must be registered every ten years. Purchase deeds are registered by filing full copies. Registries are established in all the considerable towns. The duty on sales amounts to the high figure of about 6½ per cent. on the value. Part of this is allocated to registration, in addition to which a fixed fee of 1 franc, and stationers' charges averaging 6 francs, are also chargeable. The title can usually be fully investigated from the documents in the registry. Official searches for mortgages are commonly resorted to, at a cost of about 5 francs. Under the monarchy the land system was practically copyhold tenure, but greater validity was attached to the Court Rolls than was the case in England. The present system was established by a law of 1790 after the abolition of seigniorial institutions in 1789. This was modified by the Code Napoleon, and further perfected by a law of 1855. The average value of transactions in France is very small. Probably at the present time four-fifths of the properties are of under £25 value. The costs of a sale for 200 francs (£8) would be about as follows:—Duty 13 fr.; Notary (1 p.c.), 2 fr.; expenses, 12 fr.—total 27 fr. A sale for 1000 fr. (£40) would cost about 110 fr. Taking all values, the cost of conveyance and duty reaches the high figure of 10 per cent. in the general run of transactions. The vendor as a rule has no costs. Indefeasible title is not obtainable, but frauds are almost unknown. A day or two usually suffices for all formalities. On large sales a further process known as the "purge" is undergone, which requires a few weeks and more expense, in order to guard against possible claims against which the deed registries afford no protection, such as dowries of wives, claims under guardianships, &c. A commission (Commission Extraparlementaire du Cadastre), appointed in 1891 to consider the revision of the Government cadastral maps (which are in very serious arrear) and the establishment of registration of title, has collected, in seven volumes of *Comptes Rendus*, a great mass of most interesting particulars relating to land questions in France.

Landsberg, a town of Bavaria, Germany, district of Upper Bavaria, on the river Lech, 38 miles by rail west by south of Munich. Its 15th-century church has fine stained glass. In the town house are a picture by Herkomer and frescoes by Piloty. Hubert von Herkomer was born (1849) at Waal, 7 miles to the south-west of Landsberg. Here also are a fine gateway, an agricultural school, and brewing, tanning, and manufacture of agricultural machinery, &c. Population (1900), 5977.

Landsberg - an - der - Warthe, a town of Prussia, on the navigable Warthe, 29 miles east-north-east of Küstrin by rail. The educational institutions include a gymnasium with *real* school, a burghers' school, a higher-grade girls' school, an industrial school, a drawing school, and a school for farriery. Population (1890), 28,065; (1900), 33,597.

Landshut, a town of Prussia, province of Silesia, at the north foot of the Riesengebirge and on the river Bober, 65 miles south-west of Breslau. It carries on flax-spinning and linen-weaving, and manufactures of cloth, shoes, beer, &c. The town dates from the 13th century. Here the Prussians were defeated by the Austrians in 1745, and again in 1760. Population (1900), 8241.

Landskron, chief town of a government district in north-eastern Bohemia, close to the Moravian frontier, in an extensive German-speaking enclave. It has manufactures of linen and cotton stuffs, tobacco, beer, and spirits. Population (1890), 5843; (1900), 6112, German.

Landskrona, a seaport town of Sweden, on the east side of the Sound, about half-way between Helsingborg and Malmö, 15 miles north-east of Copenhagen. The harbour is excellent, giving a depth of 35 feet, with 15 feet beside the quays. The staple industry is sugar manufacture and refining (from beetroot). In 1899 its port was cleared by 1914 vessels of 374,600 tons. On the little island of Hven, immediately opposite the town, Tycho Brahe built his famous subterranean observatory of Uranienborg in the second half of the 16th century. Population (1880), 9763; (1890), 12,253; (1900), 14,399.

Landsturm, the German equivalent of the *levée en masse*, or general levy of all men capable of bearing arms are not included in the other regularly organized forces, standing army or its second line formations, of Continental nations.

All men coming under the above category are liable to serve in it; in Germany from their eighteenth to their forty-fifth year, in Austria from their nineteenth to their forty-second, and in Russia (where it is known as the "Opolchenic") from their twentieth to their forty-third year of age. As a rule, the landsturm would not be called out except in the case of invasion of the country, but certain preparations are in most countries made for its equipment, armament, and formation. It usually consists of two portions—(a) those men who have passed through the army, or have otherwise trained before passing into the landsturm; and (b) those who have received no training whatever in consequence of

exemption for family or other reasons. The first category has a certain value, and its men would probably be organized in units which might not receive uniforms, but by international law are compelled to wear a distinguishing badge. The second category can be of but little military value, and would probably be employed as working parties, tradesmen in depôts or military factories, or in other non-combatant duties.

(J. M. GR.)

Landwehr, a German word meaning "defence of the country"; but the term as applied to an insurrectional militia is very ancient, and "lantveri" are mentioned in *Baluzii Capitularia*, as quoted in Hallam's *Middle Ages*, i. p. 262, 10th ed.

The landwehr in Prussia was first formed by a royal edict of 17th March 1813, which called up all men capable of bearing arms between the ages of eighteen and forty-five, and not serving in the regular army, for the defence of the country. After the peace of 1815 this force was made an integral part of the Prussian army, each brigade being composed of 1 line and 1 landwehr regiment. This, however, retarded the mobilization and diminished the value of the first line, and by the reorganization of 1859 the landwehr troops were relegated to the second line. The present conditions of landwehr service are given under ARMY (*Germany*). In Austria the landwehr is a totally different organization. It is in reality a *cadre* force existing alongside the regular army, and to it are handed over such recruits as, for want of vacancies, cannot be placed in the latter. These are trained for two years with the colours, and are afterwards passed for ten years into the non-active portion, but may be called up for training. There is a marked tendency to level up the landwehr to the standard of the army. In Switzerland the landwehr is simply a second line force, in which all citizens serve for twelve years, after passing twelve in the "Auszug" or field army.

(J. M. GR.)

Lange, Friedrich Albert (1828–1875), German philosopher and sociologist, was born 28th September 1828, at Wald, near Solingen, the son of the celebrated theologian, J. P. Lange. He was educated at Duisburg, Zürich, and Bonn, where he distinguished himself by gymnastics as much as by study. In 1852 he became schoolmaster at Cologne; in 1855 *privat-docent* in philosophy at Bonn; in 1858 schoolmaster at Duisburg, resigning when the Government forbade schoolmasters to take part in political agitation. Lange then entered on a career of militant journalism in the cause of political and social reform. He was also prominent in the local affairs of his town, yet found leisure to write most of his best-known books, *Die Leibesübungen* (1863), *Die Arbeiterfrage* (1865), *Geschichte des Materialismus* and *J. S. Mill's Ansichten über die sociale Frage* (both 1866). In 1866, discouraged by affairs in Germany, he moved to Winterthur, near Zürich, to become connected with the democratic *Winterthurer Landbote* newspaper. In 1869 he was *privat-docent* at Zürich, and next year professor. The strong French sympathies of the Swiss in the Franco-German war led to his speedy resignation. Thenceforward he gave up politics. In 1872 he accepted a professorship at Marburg. Unhappily, his vigorous frame was already stricken with disease, and, after a lingering illness, he died at Marburg, 21st November 1875, diligent to the end. His *Logische Studien* was published in 1877. His main work, the *History of Materialism* (translated into English), which is brilliantly written, with wide scientific knowledge and more sympathy with English thought than is usual in Germany, is rather a didactic exposition of principles than a history in the proper sense. Adopting the Kantian standpoint that we can know nothing but phenomena, Lange maintains that neither materialism nor any other metaphysical system has a valid claim to ultimate truth. For empirical phenomenal knowledge, however, which is all that man can look for, materialism with its exact scientific methods has done most valuable service. Ideal metaphysics, though they fail of the inner truth of things, have a value as the embodiment of high aspirations, in the same way as poetry and religion. In Lange's *Logische Studien*,

which attempts a reconstruction of formal logic, the leading idea is that reasoning has validity in so far as it can be represented in terms of space. His *Arbeiterfrage* advocates an ill-defined form of socialism. It protests strongly against contemporary industrial selfishness, and against the organization of industry on the Darwinian principle of struggle for existence. (H. ST.)

Langen, Joseph (1837–1901), German theologian, was born at Cologne, 3rd June 1837. He studied at Bonn, was ordained priest in 1859, was nominated professor extraordinary at the University of Bonn in 1864, and a professor in ordinary of the exegesis of the New Testament in 1867—an office which he held till his death. He was one of the able band of professors who in 1870 supported Döllinger in his resistance to the Vatican decrees, and was excommunicated, with Döllinger, Huber, Friedrich, Reusch, Reinkens, Knoedt, Hilgers, and others, for refusing to accept them. In 1878, in consequence of the permission given to priests to marry, he ceased to identify himself longer with the Old Catholic movement, although he did not return to the Roman Catholic Church. Langen was more celebrated as a writer than as a speaker. He did not address the various Old Catholic conferences which have been held between 1872 and 1897, but he rendered service to the cause by his numerous books and articles. His first work was an inquiry into the authorship of the Commentary on St Paul's Epistles, and the Treatise on Biblical Questions, ascribed to Ambrose and Augustine respectively. In 1868 he published an *Introduction to the New Testament*, a work of which a second edition was called for in 1873. He also published works on the *Last Days of the Life of Jesus*, on *Judaism in the Time of Christ*, on *John of Damascus* (1879), and an *Examination of the Vatican Dogma in the Light of Patristic Exegesis of the New Testament*. But he is chiefly famous for his *History of the Church of Rome to the Pontificate of Innocent III.*, a work of learning and research in four volumes, which appeared between 1881 and 1893. He also contributed largely to the *Internationale Theologische Zeitschrift*, a review started in 1893 by the Old Catholics to promote the union of National Churches on the basis of the councils of the Undivided Church, and admitting articles in German, French, and English. Langen's articles are on various topics. Among other subjects, he wrote on the School of Hierotheus, on Romish falsifications of the Greek Fathers, on Leo XIII., on Liberal Ultramontanism, on the Papal Teaching in regard to Morals, on Vincentius of Lerins, and he carried on a controversy with Professor Beyschlag, of the German Evangelical Church, on the respective merits of Protestantism and Old Catholicism regarded as a basis for teaching the Christian faith. An attack of apoplexy put an end to his activity as a teacher and hastened his death, which occurred in July 1901, at the age of sixty-four. (J. J. L*.)

Langenbeck, Bernhard Rudolf Konrad von (1810–1887), German surgeon, was born at Horneburg on 9th November 1810, and received his medical education at Göttingen, where he took his doctor's degree in 1835 with a thesis on the structure of the retina. After a visit to France and England, he returned to Göttingen as *privat-docent*, and in 1842 became professor of surgery and director of the Friedrichs Hospital at Kiel. Six years later he succeeded Dieffenbach as director of the Clinical Institute for Surgery and Ophthalmology at Berlin, and remained there till 1882, when failing health obliged him to retire. He died at Wiesbaden on 30th September 1887. Langenbeck was a bold and skilful operator, but at the same time belonged to the conservative school, and was disinclined to resort

to operation while other means afforded a prospect of success. He devoted particular attention to military surgery, and was a great authority in the treatment of gunshot wounds. Besides acting as general field-surgeon of the army in the war with Denmark in 1848, he also saw active service in 1864, 1866, and again in the Franco-German campaign of 1870-71. During the last, he was in Orleans at the end of 1870, after the city had been taken by the Prussians, and was unwearied in his attentions, whether as operator or consultant, to the crowds of wounded men with whom every public building was packed. Nor did he forget to utilize the opportunities for instruction that thus arose, and the "Militär-Aerztliche Gesellschaft," which met twice a week for some months, and in the discussions of which every surgeon present in the city was invited to take part, irrespective of nationality, was mainly formed by his personal energy and enthusiasm. He was ennobled for his services in the Danish war of 1864.

Langholm, a market town, burgh of barony, and police burgh (1892) of Dumfriesshire, Scotland, on the river Esk, $21\frac{3}{4}$ miles north by west of Carlisle by rail. There are six tweed mills, two distilleries, and tan works. There are a town hall and a hospital for indigent aged people. The public school gives higher education as well as elementary. Population (1891), 3643; (1901), 3142.

Langiewicz, Maryan (1827-1887), Polish patriot, was born at Krotoschin, 5th August 1827, and educated at the district school. His philological studies were completed at Breslau, and all his energies seemed to be directed to professorial work. But in a letter written when he was only seventeen years old, he declared it his wish to devote himself to military service and to the study of artillery. This taste was fostered by a year's service in the Prussian artillery, and, after some years chiefly spent in foreign travel, he joined in 1860 the expedition of Garibaldi in the kingdom of Naples. When the campaign was over, Langiewicz became professor at Cuneo; but in 1863, on the outbreak of the Polish insurrection, he was summoned by the committee and appointed military chief of Sandomir. Within six weeks his courage, his military knowledge, and his victories combined to raise him to the rank of general and dictator. During February and the early part of March 1863, by adopting the tactics of guerilla warfare, he defeated the Russians in several sanguinary battles, which might have been turned to greater advantage but for the impatience of the Poles. On 10th March he issued a proclamation assuming the dictatorship. On the 19th he endeavoured to communicate in person with the Polish Committee in Galicia, but was arrested and interned by the Austrians at Tarnow. On 2nd April he was removed to Tischnowitz, and at the end of the month to the fortress of Josefstadt. Being released in February 1865, he proceeded to Switzerland, and subsequently entered the Turkish service, in which he remained, under the name of Langie Bey, until his death, which took place at Constantinople, 11th May 1887. (G. F. B.)

Langley, Samuel Pierpont (1834-—), American physicist and astronomer, was born at Roxbury, Boston, Mass., on 22nd August 1834. After acting for a short time as assistant in Harvard College Observatory, he was appointed assistant professor of mathematics in the U.S. Naval Academy in 1866, and in the following year became director of the Allegheny Observatory at Pittsburg, a position which he held until his selection in 1887 as secretary of the Smithsonian Institution at Washington. His name is especially associated with two main branches of investigation—aeronautics, and the exploration

of the infra-red portions of the solar spectrum. The study of the latter he took up as a result of the publication in 1871 of Ladansky's energy-curve of the spectrum. The imperfections of the thermopile, with which he began his work, led him, about 1880, to the invention of the bolometer, an instrument of extraordinary delicacy, which in its most refined form is believed to be capable of detecting a change of temperature amounting to less than one-hundred-millionth of a degree centigrade. Depending on the fact that the electrical conductivity of a metallic conductor is decreased by heat, it consists of two strips of platinum, arranged so as to form the two arms of a Wheatstone bridge; one strip being exposed to a source of radiation from which the other is shielded, the heat causes a change in the resistance of one arm, the balance of the bridge is destroyed, and a deflection is marked on the galvanometer. The platinum strips are exceedingly minute, being in some cases only $\frac{1}{250}$ inch in width, and less than one-tenth of that amount in thickness. By the aid of this instrument, Langley, working on Mount Whitney, at an altitude of 12,000 feet above sea-level, had the good fortune in 1881 to discover an entirely unsuspected extension of the invisible infra-red rays, which he called the "new spectrum." The importance of his achievement may be judged from the fact that, while the visible spectrum includes rays having wave-lengths of from about 0.4μ to 0.76μ , and no invisible heat-rays were known before 1881 having a wave-length greater than 1.8μ , he has detected rays having a wave-length of 5.3μ . But, in addition, taking advantage of the accuracy with which the bolometer can determine the position of a source of heat by which it is affected, he has mapped out in this infra-red spectrum over 700 dark lines or bands resembling the Fraunhofer lines of the visible spectrum, with a probable accuracy equal to that of refined astronomical observations. In aeronautics he has succeeded in demonstrating the practicability of mechanical flight. He first undertook a preliminary inquiry into the principles upon which flight depends, and for this purpose established at Allegheny a huge "whirling table," the revolving arm of which could be driven by a steam-engine at any circumferential speed up to 70 miles an hour. The actual construction of a flying machine was next attempted. The first difficulty was to make it sufficiently light in relation to the power its machinery could develop; and in the effort to do this several machines were built in which trials were made of steam, compressed air, and carbonic acid gas as motive agents. About 1893 a satisfactory machine was ready, and a new series of troubles had to be faced, for it had to be launched at a certain initial speed, and in the face of any wind that might be blowing. To enable these conditions to be fulfilled, as well as to ensure that the machine, when it fell, should fall on water, the experiments were carried out on the Potomac river, some 30 miles below Washington. It was not till the autumn of 1894 that, after many failures, an efficient launching apparatus was devised, and then the wings were found not to be strong enough to bear the pressures to which they were subjected. Various other delays and mishaps followed, but ultimately, on the 6th May 1896, a successful flight was made. On that day an aerodrome, weighing about 30 lb and about 16 feet in length, with wings measuring between 12 and 13 feet from tip to tip, twice sustained itself in the air for $1\frac{1}{2}$ minutes (the full time for which it was supplied with fuel and water), and traversed on each occasion a distance of over half a mile, falling gently into the water when the engines stopped. Later in the same year, on 28th November, a similar aerodrome flew about three-quarters of a mile, attaining a speed of 30 miles an hour. It is understood that these experiments in artificial flight have since been

continued in connexion with the United States War Department, but details have not been published.

Langreo, a township of northern Spain, in the province of Oviedo, situated in a very hilly region watered by the river Nalon, that produces large quantities of wheat, hemp, fruit, and cider. In the neighbourhood are coal and iron mines, foundries, and factories for the manufacture of coarse stuffs for local use. Population (1887), 14,015; (1897), 15,709.

Lanier, Sidney (1842–1881), American poet, was born at Macon, Georgia, on 3rd February 1842. He was of Huguenot descent on his father's side, and of Scottish and Virginian on his mother's. From childhood he was passionately fond of music, and could play on any instrument. His subsequent mastery of the flute helped to support him and greatly increased his reputation. At the age of fourteen he entered Oglethorpe College, where, after graduating with distinction, he held a tutorship until the Civil War began. He enlisted in the Confederate army in April 1861, serving first in Virginia, and finding opportunities to continue his studies. After the seven days' battles around Richmond, he was transferred to the signal service. About this time the first symptoms of consumption appeared. He subsequently served in a blockade-runner, but his vessel was captured, and he was confined for five months in a Federal prison, his flute proving the best of companions. Exchanged early in 1865, he started home on foot, arriving in a state of exhaustion that led to a severe illness. On recovering, he became a clerk in Montgomery, Alabama. In the spring of 1867 he visited New York in connexion with his novel *Tiger Lilies*—an immature work, dealing in part with his war experiences, and now difficult to obtain. Later in the same year he took charge of a country school in Alabama, and was married to Miss Mary Day of his native town. The next year he returned to Macon in low health, and began to study and practise law with his father, poetry and music cheering him in his struggles with disease. Late in 1872 he went to Texas for his health, but was forced to return. Then he determined to use his remaining strength in the service of the arts he loved, and went north, securing an engagement as first flute in the Peabody concerts at Baltimore (December 1873). His means were still narrow, and he was much away from his family, travelling for his health, but he found time to write a guide-book to Florida (1876), and tales for boys from Froissart, Malory, the Mabinogion, and Percy's *Reliques* (1878–82). He now made congenial friends, such as Bayard Taylor, his reputation gradually increased, and he was enabled to study music and literature, especially Anglo-Saxon poetry. In 1876 he wrote his ambitious cantata for the Centennial Exposition, and brought his family north. A small volume of verse appeared in the next year. Travel south was still necessary, but he preserved his courage, and wrote and lectured and played the flute. In 1879 he was made lecturer on English literature at Johns Hopkins University. His lectures became the basis of his *Science of English Verse* (1880)—his most important prose work, and an admirable discussion of the relations of music and poetry—and also of his *English Novel* (1883), which, devoted largely to George Eliot, is suggestive, but one-sided. Work had to be abandoned on account of growing feebleness, and in the spring of 1881 he was carried to Lynn, North Carolina, to try camp life, and died there on 7th September. Since his death his fame has grown steadily and greatly, an enlarged and final edition of his poems, prepared by his wife, his *Letters*, 1866–81 (1899), and several volumes of miscellaneous prose having assisted

in keeping his name before the public. Among his more noteworthy poems are "Corn," "The Revenge of Hamish," "Song of the Chattahoochee," and "The Marshes of Glynn." By some his genius is regarded as musical rather than poetic, and his style is considered hectic; by others he is held to be one of the most original and most talented of modern American poets. He is considered the leading writer of the New South, the greatest Southern poet since Poe, and a man of heroic and exquisite character. (w. p. t.)

Lansing, a city of Michigan, U.S.A., capital of Ingham county and the capital of the state, on the Grand river at the mouth of the Cedar, at an altitude of 847 feet. It is on four railways, the Père Marquette, the Grand Trunk, the Lake Shore and Michigan Southern, and the Michigan Central. Besides the state capitol and other state buildings and institutions, the city contains the State Agricultural College, which had in 1899 a faculty of 43 and was attended by 528 students. It had property and endowments of over a million dollars. The manufactures consist in great part of agricultural tools and machines, waggons, carriages, and flour. Population (1890), 13,102; (1900), 16,485, of whom 2397 were foreign-born and 323 were negroes.

Lansingburg, a village of Rensselaer county, New York, U.S.A., on the east bank of the Hudson river, opposite the mouth of the Mohawk, on the Fitchburg railroad, at an altitude of 113 feet. Its site is level and its plan regular. It has considerable river traffic, and manufactures of clothing, collars, shirts, &c. Population (1890), 10,550; (1900), 12,595, of whom 2139 were foreign-born and 90 were negroes.

Lanza, Giovanni (1810–1882), Italian patriot and statesman, was born at Casale in February 1810. While medical student at Turin he founded the journal *L'Opinione*, to urge Charles Albert to grant reforms and make war upon Austria. In 1848 he offered himself as volunteer, but, upon being elected deputy, returned to Turin, where he became a determined opponent of the Government, accusing the Piedmontese generals of treason and protesting against the conclusion of peace with Austria. In 1854, however, he defended Cavour's Crimean policy, in 1855 was appointed Minister for Education, and in 1858, Finance Minister. After the peace of Villafranca he resigned office, but in 1860 accepted the presidency of the Chamber. Entering the La Marmora Cabinet of 1864, he found himself in disagreement with his colleagues on the ecclesiastical question, and resigned. Again elected President of the Chamber, he left that position in 1869 to combat the tobacco monopoly scheme proposed by the Menabrea Cabinet, and, though the scheme was adopted, Lanza's subsequent re-election to the presidency caused a cabinet crisis which was only solved by the formation of a ministry in which Lanza assumed the premiership. The Lanza Cabinet held office from 1869 to 1873, and succeeded in preventing a Franco-Italian alliance against Prussia, in accomplishing the unity of Italy by the occupation of Rome, in re-establishing sound finance, in passing the Law of Guarantees, and in extending to the city and province of Rome the Ecclesiastical Law of 1868. A man of unimpeachable integrity and sound judgment, and a prudent rather than a brilliant statesman, Lanza embodied many of the best qualities of the Piedmontese character. He died at Rome on 19th March 1882. (H. W. S.)

Lao, or LOAS, the name given to a branch of the widespread Tai or Shân race, which is found over the whole of

Indo-China from 28° N. and the sources of the Irrawaddy, as far as Cambodia, and 7° N. in the Malay peninsula.

The various families of the Tai now met with, owing to the different circumstances which have attended their migrations, differ considerably in the degree of civilization to which they have attained. The Lao, who descended from the mountain districts of Yunnan, Szechuan, and Kweichau to the pleasant highland plains of Upper Indo-China, and drove the wilder Ka peoples whom they found in possession into the hills, mostly adopted Buddhism, and formed small settled communities or states in which laws were easy, taxes light, and a very fair degree of comfort was attained. The Lao Pong Dam, so called from their habit of tattooing the body from the waist to the knee, descended by Chieng Sen and Chieng Mai, and now form the western branch of the Lao family, inhabiting the Siamese Lao states of Chieng Mai Lakawn, "Turn Pre, and Nan, and reaching as far south as 17° N. Various influences have contributed to making the Lao the pleasant, easy-going, idle fellow that he is. The result is that practically all the trade of these states is in the hands of Bangkok Chinese firms, of a certain number of European houses and others, while most of the manual labour connected with the teak industry is done by Ka Mus, who migrate in large numbers from the left bank of the Mekong.

The Lao Pong Kao, or eastern branch, appear to have migrated southwards by the more easterly route of the Nam-u and the Mekong valley. In contradistinction to the Lao Pong Dam, who have derived their written language from the Burmese character, the eastern race has retained what appears to be the early form of the present Siamese writing, from which it differs but little. They formed important settlements at various points on the Mekong, notably Luang Prabang, Wieng Chan, Ubon, and Bassac; and, heading inland as far as Korat on the one side and the Annamite watershed in the east, they drove out the less civilized Ka peoples, and even the Cambodians, as the Lao Pong Dam did on the west. Wieng Chan during the 18th century was the most powerful of the Lao principalities, and was feared and respected throughout Indo-China. It was destroyed by the Siamese in 1828. The inhabitants, in accordance with the Indo-Chinese custom of the day, were transported to Lower Siam. The Lao Pong Kao below 18° N. are a less merry and less vivacious people, and are for the most part shorter and more thick-set than those of Luang Prabang and the north. If possible, they are as a race lazier than the western Lao, as they are certainly more musical. The "khen," or mouth organ, which is universal among them, is the sweetest-toned of Eastern instruments.

Closely allied with the Lao are a number of tribes who are found throughout the hill regions of the Upper Mekong, between Yunnan and Kwangsi in China and the upper waters of the Menam in Siam. They have all within recent times been part-takers in the general movement which has been going on towards the south-west from the highland districts of southern China, which has produced so many recruits for the peopling of the Indo-Chinese peninsula. Of this group of people, among whom may be named the Yao, Yao Yin, Lanten, Meo, Mnsur (or Muhsu), and Kaw, perhaps the best known and most like the Lao are the Lu—both names meaning originally "man"—who have in many cases adopted a form of Buddhism (flavoured strongly by their natural respect for local spirits as well as tattooing) and other relatively civilized customs, and have forsaken their wandering life among the hills for a more settled village existence. Hardy, simple, and industrious, fond of music, kind-hearted, and with a strangely artistic taste in dress, these people possess in a wonderful degree the secret of cheerful contentment.

Laoag, the capital of the province of North Ilocos, Luzon, Philippine Islands, on the banks of the Laoag river, some three miles from the Pacific coast. It is noted for its fine climate, the name "Laoag" signifying "clear." It is an important centre for the shipment of agricultural products, among which may be mentioned rice, Indian corn, tobacco, and sugar. Cotton is grown in the vicinity, and is woven by the women into fabrics, which find a ready sale among the pagan tribes of the mountains. The language is Ilocano. Population, 37,000.

Laon, chief town of the department of Aisne, 87 miles north-east of Paris, on the railway from Paris to Belgium. It is a first-class military post, and, according to M. Ténot, "the strategic key of the whole region comprised between the Aisne and the northern frontier." Since the war of 1870–71 the citadel has been reorganized and two batteries have been erected, one at each of the other angles of the rock on which Laon stands. At distances varying from 3½ to 5 miles from the town are other defences. The Porte des Chenizelles, one of the 13th-century gateways of the town, was restored in 1895. Population (1881), 9662; (1891), 9555; (1901), 15,434.

La Paz, a department of Bolivia, bounded on the N. by the Bolivian territories of Madre de Dios and Beni, on the S. by the departments of Oruro and Cochabamba, on the E. by Cochabamba and Beni, and on the W. by Peru. Its area is 171,130 square miles, and in 1893 it had a population of 593,779. The capital, LA PAZ, which is also the capital of the republic and the largest city in it, had a population of 62,320. The department is divided into nine provinces. It has 83 schools, attended by about 5000 pupils.

Lapland, although no longer a geographical term, is conveniently retained as an ethnographical conception to indicate the region inhabited by the Lapps; that is, in Norway, the county of Finmarken,¹ and the higher inland parts of counties Tromsø and Nordland; in Sweden, the inland and northern parts of the division of Norrland, sometimes known as Lappmark, and divided into five districts—Torne Lappmark, Lule Lappmark, Pite Lappmark, Lycksele Lappmark, and Åsele Lappmark; and in Russia, the northern part of the Finnish county of Uleåborg, and the western part of the Russian government of Archangel as far as the White Sea. In Norway the total number of Lapps was 20,786 in 1891, and in Sweden in 1895 it was officially estimated that there were 4736. Add to these some 3000 for Russian Lapland, and the total Lapp population of northern Europe approximates to 30,000. In Sweden the Lapps are gradually abandoning their nomadic habits and becoming merged in the Swedish population. The view that the Lapps at one time occupied the whole of the Scandinavian peninsula, and have during the course of centuries been driven back by the Aryan Swedes and Norwegians, is disproved by the recent investigations of Yngvar Nielsen, K. B. Wiklund, and others. The fact is, the Lapps are increasing in numbers, as well as pushing their way farther and farther south. In the beginning of the 16th century their southern border line in Norway ran on the upper side of 64° N. In 1890 they forced their way to the head of the Hardanger Fjord in 60° N. In Sweden the presence of Lapps as far south as Jämtland (or Jemtland) is first mentioned in 1564. In 1881 they pushed on into the north of Dalecarlia, about 61° 45' N. The majority of the Norwegian Lapps lead a semi-nomadic existence; but the number of inveterate nomads can scarcely reach 1500 at the present day. In Sweden there were about 3300 nomads in 1895.

Although the first attempt to convert the Lapps to Christianity seems to have been made in the 11th century, the worship of heathen idols was carried on openly in Swedish Lappmark as late as 1687, and secretly in Norway down to the first quarter of the 18th century, while the practices of heathen superstition survived on into the 19th century, if indeed they are extinct even yet. Lapp graves, prepared in the heathen manner, have been discovered in Upper Namdalen (Norway), belonging to the years 1820 and 1826. It may be interesting to mention that Lapps, armed with bows and arrows, were attached to certain regiments of Gustavus Adolphus

¹ The Norwegians call the Lapps Finns, and the Finns they call Kvæns or Qvæns, though the word "Lapper" (for Lapps) is coming into use.

in Germany during the Thirty Years' War. It was not until 1840 that the New Testament was translated into Norwegian Lappish, and not until the year 1895 that the entire Bible was printed in the same dialect. In the Russian dialect of Lappish there exist only a couple of versions of St Matthew's Gospel. Amongst the more recent works dealing with the Lapp language may be mentioned a dictionary (1887) by J. A. Friis; a reader, with German translations (1888), by J. Qvigstad; a dictionary (1890) and two grammars (1891 and 1897) of the Luleå dialect, and a chrestomathy of Norwegian Lappish (1894), by K. B. Wiklund; a dictionary of Russian Lappish, or the Kola dialect (1891), by A. Genetz; readers of different dialects (1885-96), by J. Halász; and a grammar of Norwegian Lappish (1882), by S. Nielsen; further, a comparative study of Lappish and Finnish, by Qvigstad in the *Acts of the Finnish Academy of Science*, vol. xii., 1883; the same author's *Nordische Lehnwörter im Lappischen* (1893); and Wiklund's *Entwurf einer uralappischen Lautlehre* (1896). The older literature on the Lapps has received a notable addition by the discovery in 1896, amongst the letters of Linnæus preserved in the British Museum, of a MS. diary of a journey made in 1695 to the north of Swedish Lappmark by Olof Rudbeck the younger.

La Plata, a city of the Argentine Republic, capital of the province of Buenos Aires, 3 miles from the port of La Plata and about 35 miles south-east of the city of Buenos Aires by rail. In 1895 it had a population of 45,609, which was estimated to have increased in 1900 to 61,000. This large and handsome city was entirely the growth of the last twenty years of the 19th century, having been founded in 1882, two years after Buenos Aires, previously the capital of the province, had been formally declared the federal capital and a separate administrative unit. Laid out on the plan of Washington, the streets are wide and frequently broken by large squares. The principal public buildings are the government house, the provincial parliament, the town hall, the cathedral (in course of construction), the courts of justice, and the provincial museum. The museum, originally presented by Dr Moreno, has grown to be one of the most important in South America, its palæontological and anthropological collections being unique. There are also a university, a national college, a public library, an astronomical observatory, and numerous churches and theatres. Electricity is in general use for lighting, and tramways are laid down in the principal thoroughfares. A large public park is maintained. La Plata is a municipality, but the police are under the provincial government. The harbour of the port of La Plata, which has taken the place of the old port of Ensenada, has been artificially constructed, and is capable of accommodating the largest ship that can navigate the river Plate. Various canals, &c., give entrance to a large dock about 1450 yards long by 150 broad. The export of cattle and agricultural produce furnishes most of the trade. The port is the point of arrival of the Royal Mail and Messageries Maritimes steamers.

Laporte, a city of Indiana, U.S.A., capital of Laporte county, at an altitude of 810 feet. It has modern improvements, and some reputation as a summer resort. Three railways—the Chicago and West Michigan, the Lake Erie and Western, and the Lake Shore and Michigan Southern—pass through it. Population (1890), 7126; (1900), 7113, of whom 1403 were foreign-born and 59 were negroes.

Lappa, the name given to a station of the Chinese imperial Maritime Customs which collects duties on vessels trading between China and the colony of Macao. The

arrangement is altogether abnormal, and was consented to by the Portuguese Government in 1887 to assist the Chinese authorities in the suppression of opium smuggling. A similar arrangement prevails at the British colony of Hong-Kong, where the Chinese customs station is termed Kowloon. In both cases the customs stations are on Chinese territory, just outside the colonial boundary, but in both their function is to levy duties on vessels entering and leaving the foreign port in lieu of levying them, as ought to be done, on entering or leaving a Chinese port. The value of the trade passing through the custom house in 1899 was H. taels 13,748,000 (£2,062,000).

Lappmark, the districts inhabited by the Lapps in Sweden. See LAPLAND.

Laprade, Pierre Marin Victor Richard de (1812-1883), known as VICTOR, French poet and critic, was born 15th January 1812, at Montbrison, in the department of the Loire. He came of a modest provincial family, and owed to the care of excellent parents a deep foundation of character and encouragement to enter upon a scholar's career. His life was singularly uneventful. After completing his studies at Lyons, he produced in 1839 a small volume of religious verse, *Les Parfums de Madeleine*. This was followed in 1840 by *La Colère de Jésus*, in 1841 by the religious fantasy of *Psyché*, and in 1844 by *Odes et Poèmes*. In 1845 Laprade visited Italy on a mission of literary research, and in 1847 he was appointed professor of French literature at Lyons. The French Academy, by a single vote, preferred Émile Augier at the election in 1857, but in the following year Laprade was chosen to fill the chair of Alfred de Musset. In 1861 he was removed from his post at Lyons owing to the publication of a political satire in verse (*Les Muses d'État*), and in 1871 took his seat in the National Assembly on the benches of the Right. He died 13th December 1883. A statue has been raised by his fellow-townsmen at Montbrison. Besides those named above, Laprade's poetical works include *Poèmes Évangéliques* (1852), *Idylles Héroïques* (1858), *Les Voix de Silence* (1864), *Pernette* (1868), *Poèmes Civiles* (1873), *Le Livre d'un Père* (1877), *Varia* and *Livre des Adieux* (1878-1879). In prose he published, in 1840, *Des Habitudes Intellectuelles de l'Avocat*. *Questions d'Art et de Morale* appeared in 1861, succeeded by *Le sentiment de la nature, avant le Christianisme* in 1866, and *chez les modernes* in 1868, *Éducation Libérale* in 1873. The material for these books had in some cases been printed earlier, after delivery as a lecture. He also contributed articles to the *Revue des Deux Mondes* and the *Revue de Paris*. There is no writer who represents more perfectly than Laprade the admirable genius of French provincial life, its homely simplicity, its culture, its piety, and its sober patriotism. As a poet he belongs to the school of Chateaubriand and Lamartine. Devoted to the best classical models, inspired by a sense of the ideal and by worship of nature as revealing the divine—gifted, too, with a full faculty of expression—he lacked only fire and passion in the equipment of a romantic poet. But the want of these, and the pressure of a certain chilly facility and of a too conscious philosophizing, have prevented him from reaching the first rank, or from even attaining the popularity due to his high place in the second. Only in his patriotic verse did he shake himself clear from these trammels. Speaking generally, he possessed some of the qualities, and many of the defects, of the English Lake School. Laprade's prose criticisms must be ranked high. Apart from his classical and metaphysical studies, he was widely read in the literatures of Europe, and built upon the groundwork of a naturally correct taste. His dislike of irony and scepti-

cism probably led him to underrate the product of the 18th century, and there are signs of a too fastidious dread of Philistinism. But a constant love of the best, a joy in nature, and a lofty patriotism are not less evident than in his poetry. Few writers of any nation have fixed their minds so steadily on whatsoever things are pure, and lovely, and of good report. (c.)

Laraiche (*El Arâish*), a port at the mouth of the Kûs in northern Morocco, the nearest to Fez and Mequinez, adjoining the ruins of Shammish or Lixus. A small mercantile European colony, missions, and consular officers are situated here. Exports: 1896, £31,201; 1900, £47,033; average for 1896–1900, £49,760. Wool and bird-seeds are the largest items of export. Imports, chiefly cottons and sugar: 1896, £249,902; 1900, £114,693; average for 1896–1900, £187,630. Shipping: 1896, 63,646 tons; 1899, 78,765 tons. In 1895, with good crops, Laraiche imported £344,204 worth of foreign goods, the bulk of which were for Fez and Mequinez. Population, about 6500.

Laramie, a city of Wyoming, U.S.A., capital of Albany county, on the Laramie plains, on the east bank of the Laramie river, and on the Union Pacific railroad, at an altitude of 7153 feet. Its site is level, and the city is regular in plan. It is in a live-stock region, and has considerable trade in cattle. It contains the machine works of the Union Pacific railroad. The University of Wyoming, founded in 1887, is situated here. In 1899 it had a faculty of 14 and was attended by 142 students, nearly half of whom were women. The city was founded in 1868 and chartered in 1873. Population (1880), 2696; (1890), 6388; (1900), 8207, of whom 1280 were foreign-born and 90 were negroes.

Laredo, a coast town of Spain, in the province of Santander, 20 miles east by south of Santander. The mole and port are blocked by a sandbank, but the town began to recover during the last years of the 19th century from the decay into which it had fallen, and important works have been instituted with the object of restoring it to some of its past importance. There are old forts on the neighbouring heights. The town contains a fine parish church, several convents and chapels, and a large town hall. The principal local industries are connected with the fisheries and manufactures of rope, sails, casks, and tins for fish, great quantities of which are salted and exported. Population (1897), 5073.

Laredo, a city of Texas, U.S.A., capital of Webb county, on the east bank of the Rio Grande, opposite Nuevo Laredo, Mexico, with which it is connected by two bridges, at an altitude of 421 feet. It is on three railways—the International and Great Northern, the Mexico National, and the Rio Grande and Eagle Pass. It is essentially a railway town, with a large export and import trade with Mexico. Population (1880), 3521; (1890), 11,319; (1900), 13,429, of whom 6882 were foreign-born and 87 were negroes.

Largs, a police burgh on the coast of Ayrshire, Scotland, 43 miles west of Glasgow by rail. A good beach and a dry and bracing climate have attracted an exceptional number of wealthy residents. Skelmorlie Aisle, the remnant of an ancient parish church, was converted into a mausoleum in 1636. Near it a mound covers remains, possibly those of Norwegians slain in the famous battle of Largs (1263) between Alexander III. and Haco III. of Norway. The academy has been fitted up as a workmen's club and library; there are two convalescent homes. The harbour, affording 12 to 14 feet of water, is used mainly by Clyde passenger steamers and yachtsmen.

A new parish church cost over £20,000, and a United Free church £30,000. Population (1881), 3079; (1901), 3243.

Larissa, a town in the province of Larissa, Thessaly, Greece, on the Peneios, about 35 miles north-west of Volo, with which it is connected by rail. Population (1889), 13,610; (1896), 15,373.

Larkhall, a mining and manufacturing town of Lanarkshire, Scotland, 14 miles south-east of Glasgow by rail. The highest bridge in Scotland has been thrown across the river Avon, which flows close by. Brick-making is carried on at several of the adjoining collieries. Other works are bleach works, a silk-weaving factory, fire-clay and enamelling works, and a sanitary appliances factory. The town has a public hall and baths. Population (1881), 6503; (1901), 12,034.

Larkhana, a town of British India, in the Shikarpur district of Sind, Bombay; on a canal not far from the right bank of the Indus; a station on the North-Western railway, 281 miles north of Karachi. A centre of trade, with manufactures of cotton, silk, leather, metal-ware, and paper. Population (1881), 13,188; (1891), 12,010.

Larnaca (LARNICA or LARNECA; in Turkish *Tuzla*), a town of the island of Cyprus, situated at the head of a bay on the south coast, 23 miles south-south-east from Nicosia. It is the principal port of the island, exporting barley, wheat, cotton, raisins, oranges, lemons, and gypsum. There is an iron pier, 450 feet long, but vessels anchor in the bay, in from 16 to 70 feet of water. It occupies the site of the ancient *Citium*, but the citadel of the ancient city was used to fill up the ancient harbour in 1879. Mycenæan tombs and other antiquities have been found in the vicinity. Population (1901), 7964.

Lasalle, a city of Lasalle county, Illinois, U.S.A., on the north bank of the Illinois river, at an altitude of 461 feet. It is built on the face of steep banks, yet with a regular plan. It has three railways—the Chicago, Burlington, and Quincy, the Chicago, Rock Island, and Pacific, and the Illinois Central. It is in a region of mines of bituminous coal, of which it ships large quantities. It has also zinc smelting works and other manufactures. Population (1890), 9855; (1900), 10,446, of whom 3471 were foreign-born.

Lasker, Eduard (1829–1884), German publicist, was born on 14th October 1829, at Jaroczin, a village in the province of Posen, being the son of a Jewish tradesman. He attended the gymnasium, and afterwards the University of Breslau. In 1848, after the outbreak of the Revolution, he went to Vienna and entered the Students' Legion which took so prominent a part in the disturbances; he fought against the Imperial troops during the siege of the city in October, but was fortunate enough to be able to return to his home. He then continued his legal studies at Breslau and Berlin, and after a visit of three years to England, then the model state for German Liberals, entered the Prussian judicial service. He was occupied in various posts, chiefly in the Berlin city courts, but he never advanced far in his official career. In 1870 he left the Government service, and in 1873 was appointed to an administrative post in the service of the corporation of Berlin. He had been brought to the notice of the political world by some articles he wrote in 1861 to 1864, which were afterwards published under the title *Zur Verfassungsgeschichte Preussens*, and in 1865 he was elected member for one of the divisions of Berlin in the Prussian Parliament. He joined the Radical or *Fortschritt* party, and in 1867 was also elected to the German Parliament, but he

joined in forming the National Liberal party, and in consequence lost his seat in Berlin, which remained faithful to the Radicals; after this he represented Magdeburg and Frankfort-on-Main in the Prussian, and Meiningen in the German, Parliament. He threw himself with great energy into his parliamentary duties, and quickly became one of the most popular and most influential members. An optimist and idealist, he joined to a fervent belief in liberty an equal enthusiasm for German unity and the idea of the German state. His motion that Baden should be included in the North German Confederation in January 1870 caused much embarrassment to Bismarck, but was not without effect in hastening the crisis of 1870. His great work, however, was the share he took in the judicial reform which was the great achievement of the parliament during the ten years 1867-77. To him more than to any other single individual is due the great codification of the law. He threw himself into this work with remarkable industry, and while he again and again was able to compel the Government to withdraw or amend proposals which seemed dangerous to liberty, he opposed those Liberals who, unable to obtain all the concessions they called for, refused to vote for the new laws as a whole. A speech made by Lasker on 7th February 1873, in which he attacked the management of the Pomeranian railway, caused a great sensation, and his exposure of the financial mismanagement brought about the fall of Wagener, one of Bismarck's most trusted assistants. By this action he caused, however, some embarrassment to his party. This is generally regarded as the beginning of the reaction against economic Liberalism by which he and his party were to be deprived of their influence. He refused to follow Bismarck in his financial and economic policy after 1878; always unsympathetic to the Chancellor, he was now selected for his most bitter attacks. Between the Radicals and Socialists on the one side and the Government on the other, like many of his friends, he was unable to maintain himself. In 1880 he lost his seat in the Prussian Parliament; he joined the *Secession*, but was ill at ease in his new position. Broken in health and spirits by the incessant labours of the time when he did "half the work of the Reichstag," he went in 1883 for a tour in America, and died in that country on the 5th of January 1884. He was unmarried.

Lasker's death was the occasion of a curious episode, which caused much discussion at the time. The American House of Representatives adopted a motion of regret, and added to it these words:—"That his loss is not alone to be mourned by the people of his native land, where his firm and constant exposition of, and devotion to, free and liberal ideas have materially advanced the social, political, and economic conditions of these people, but by the lovers of liberty throughout the world." This motion was sent through the American envoy at Berlin to the German Foreign Office, with a request that it might be communicated to the President of the Reichstag. It was to ask Bismarck officially to communicate a resolution in which a foreign parliament expressed an opinion in German affairs exactly opposed to that which the Emperor at his advice had always followed. Bismarck therefore refused to communicate the resolution, and returned it to the German envoy at Washington. He was much attacked for this; but the difficulty would have been avoided had the resolution been so framed as not to express an opinion on the merits of Lasker's opinions, which at that time were a matter of keen controversy, or had it been communicated directly to the President of the Reichstag, and not by the means of diplomatic agents, who are the agents of communication not between parliament and parliament, but between government and government.

(J. W. HE.)

Las Palmas, a town on the east coast of the island of Grand Canary, residence of the bishop of Canarias and of the military governor. It is a well-built town, with a modern theatre, atheneum club, several hospitals, good schools, and an institute. Las Palmas is a free port and harbour of refuge. Its trade is important,

especially as a port of call and a coaling station, and the greater part is in British hands, though the Germans have been trying hard to get a footing since 1896. The coal trade is entirely in British hands; 213,000 tons were imported in 1898. The total value of imports in 1898 was £438,411, of which £223,127 came from England. The exports were chiefly bananas (£174,900 in 1900), tomatoes, potatoes, and oranges, the greater part for Liverpool and London. The port had a total shipping movement in 1898 of 1816 steamers, of which 1073 were British, 301 Spanish, 174 German, 122 Italian, 78 French, and 1015 sailing vessels, of which three were British and 993 Spanish. The harbour works of the port of LA LUZ have been much improved since 1883, the Santa Catalina mole has been pushed into deep water, and road communication has been extended to the north and centre of the island and to Las Palmas itself. There are engineering works and shipbuilding yards, and a slipway which will take vessels up to 800 tons. The harbour has an area of nearly 160 acres, with a depth varying from 35 to 60 feet. Population (1887), 21,018; (1897), 34,770.

Latacunga (LLATACUNGA, OR, according to local usage, TACUNGA), chief town of the province of Leon, Ecuador, Central America, on a high plateau of the Andes, over 9000 feet above sea-level, near the confluence of the Alagues and the Cutuchi to form the Patate, an affluent of the Pastaza, 52 miles south of Quito, and about 25 south-east of the volcano of Cotopaxi. Founded in 1534, it was four times destroyed by earthquakes between 1698 and 1798. It is substantially built, chiefly of pumice stone. A large proportion of the inhabitants are Indians, and the trade is mainly local. Nitrate of potash is obtained from the volcanic deposits in the neighbourhood. In the vicinity are the ruins of a palace of the Lucas. Population, 10,000.

Latakia, OR LADIKIYEH, the chief town of a sanjak of the Beirut vilayet, situated on the Syrian coast, opposite the island of Cyprus. The population comprises 12,000 Moslems, 10,000 Christians (Syrians, Armenians, Maronites, Roman Catholics, and Protestants). The people are chiefly employed in tobacco cultivation, silk culture, and the sponge fishery. In 1900 the exports amounted to £79,512, and the imports to £64,000.

Lauban, a town of Prussia, province of Silesia, 16 miles by rail east of Görlitz. It has potteries, tanneries, bleaching, oil mills, linen and cotton weaving and printing, and manufacture of machinery. There are monuments to the Emperor William I. (1895) and the war of 1870-71. Population (1885), 11,236; (1900), 13,792.

Lauenburg, a town of Prussia, province of Pomerania, 50 miles by rail north-west of Danzig. It has a deaf and dumb asylum, and a provincial lunatic asylum; and flax and woollen spinning, iron-works, and brick-works. Population (1885), 7214; (1900), 10,436.

Laun (Czech, *Louny*), the chief town of a government district in north-west Bohemia, Austria, on the right bank of the Eger. The boundary between the Czech and German districts lies between it and the neighbouring town of Postelberg to the west. It has machine and metal industries, sugar-refining, brewing, and corn-milling. Population (1890), 6346; (1900), 10,212.

Launceston (OR DUNHEVED), a municipal borough and market town in the North-eastern or Launceston parliamentary division (since 1885) of Cornwall, England, on the Kensey, 13 miles by road and 19 miles by rail north-west by west of Tavistock. Recent structures are the town hall (1887), a temperance institute (1889), a Baptist chapel (1892), a Bible Christian chapel, water-works (1895), sewage disposal works (1898), and a public library (1899). There are tanneries and iron-foundries. Area,

2188 acres. Population (1881), 3808; (1891), 4345; (1901), 4053.

Launceston, the second city of Tasmania, on the river Tamar, in the county of Cornwall, about 40 miles from the north coast of the island by water. The river is navigable to the town for vessels of 4000 tons at full tide. There is a railway. The city is well laid out and has a good water-supply. The electric lighting has cost £90,000. The Albert Hall seats over 2000 people. The quantity of fruit grown in the district increases yearly. The scenery is very picturesque. The mean annual rainfall (3 years) is 31·97 inches. Population of city proper (1891), 17,208; (1901), 21,180.

La Union, a town of Spain, province of Murcia, 5 miles east of Cartagena and close to the Mediterranean. Population within municipal boundaries (1887), 20,966; (1897), 21,594, of whom a little more than half inhabit the place itself. The rest are scattered among thirty works or foundries, and mine iron, manganese, calamine, sulphur, and lead. It is quite a modern town, having sprung up in the second half of the 19th century. It has good modern municipal buildings, schools, hospital, town hall, large factories, regular streets, and a very animated aspect.

Laurier, Sir Wilfrid (1841—), British Colonial statesman, the first French-Canadian Premier of the Dominion, was born at St Lin, Quebec, 20th November 1841. He was educated at L'Assomption College, graduated in law at McGill University in 1864, and was admitted to the bar in the same year. His ability at once became manifest, and he rose rapidly in his profession. In 1871 he began his political career, when he was elected as a Liberal to the Quebec Provincial Assembly. His eloquence and grasp of public questions speedily gave him a conspicuous position. In 1874 he was elected to the Dominion Parliament, where by his high personal character and great oratorical gifts he soon became one of the leaders of the Liberal party. At one time he edited *Le Dériveur*. In 1877 Laurier was appointed Minister of Inland Revenue in the Mackenzie government, a position which he held until the resignation of the ministry in 1878. He was a consistent advocate of the policy of Free Trade, so far as the revenue requirements of the colony would allow. Although a Roman Catholic, his uncompromising resistance to the dictation of the Roman Catholic hierarchy on the Manitoba schools question demonstrated that he was independent of clerical influence in political affairs. On the retirement of Mr Blake from the leadership of the Liberal party in 1891, Laurier was chosen as his successor. When the Conservative Premier brought forward proposals for a reciprocity treaty with the United States, with certain restrictions, Laurier and the Liberals advocated unrestricted reciprocity. At the general election of 1896 Laurier's platform included fiscal reform in the direction of Free Trade, the extension of the franchise, the enlargement of the trade of Canada, and a policy of non-interference with provincial politics, especially with regard to Manitoba. The Liberals secured a striking victory—the numbers being, 118 Liberals, 86 Conservatives, and 8 Independents, who were general supporters of the Liberal party. Laurier became Prime Minister, and the session of 1897 was distinguished for its epoch-making financial measures, a preferential rate in the tariff being given to imports from the mother-country (see CANADA). The celebrations of 1897 in honour of Queen Victoria's Diamond Jubilee excited extraordinary enthusiasm throughout Canada. The colonial premiers visited London in order to attend the festivities, and on that occasion Laurier was appointed a privy councillor and created G.C.M.G. His personality at once made an

impression in England. His facial resemblance to both Lord Beaconsfield and Sir John A. Macdonald, his vigorous patriotic speeches, in which, while acclaiming the Imperial tie with the mother country, he vindicated for Canada its title to be called a "nation," and his striking position as a colonial Liberal leader who was yet an Imperialist, made him everywhere a remarkable figure. When war broke out in South Africa in October 1899, the Laurier Cabinet at once decided to send a force of 1000 men to assist the Imperial Government. In March 1900 the Dominion Assembly, after an eloquent speech from Sir Wilfrid, approved the action of the Government. In November 1900 the general election took place throughout the Dominion, when a largely increased majority was returned for Laurier's Government. In the session of 1901 Sir Wilfrid Laurier introduced and carried a Bill decreeing that Queen Victoria's birthday should be made a perpetual holiday throughout the Dominion.

Laurium, a village in Houghton county, Michigan, U.S.A., formerly CALUMET. It is on the Upper Peninsula, in the copper region of Keweenaw Point. Population (1890), 1159; (1900), 5643, of whom 2286 were foreign-born.

Laurvik, or LARVIK, a seaport town of Norway, at the head of a bay on the south coast, 98 miles by rail south-south-west of Christiania. It has various industries, including saw and planing mills, shipbuilding, glass-works, and factories for wood-pulp, barrels, and potato flour; and an active trade in exporting timber, ice, wood-pulp, and granite, chiefly to Great Britain, and in importing from the same country coal and salt. The total trade amounts to about £330,000 annually. The port, which can receive the largest vessels, and has a depth of 18 to 24 feet beside the quays, is entered and cleared by close upon 100,000 tons annually. A much-frequented hydropathic was opened in 1880. Population (1891), 11,261; (1900), 10,664.

Lausanne, the capital of the canton of Vaud, in Switzerland, 38 miles by rail north-east of Geneva. It is 328 feet above the lake, or 1558½ feet above the level of the sea. The Grand Pont, 79 feet high and 590½ feet long, was widened in 1891. The academy was founded in 1537, immediately after the Bernese conquest of 1536, and in 1891 was raised to the rank of a university. In the winter of 1898–99 it was attended by 264 matriculated students. Gibbon's house, La Grotte, was only destroyed a few years ago. Population (1888), 33,340; (1900), 47,444. In 1888 the French-speaking inhabitants numbered 25,750; the German-speaking, 5704; the Italian-speaking, 852; other languages, 1034. In the same year the Protestants numbered 28,431; Roman Catholics, 4575; Jews, 184.

See vols. vi. and vii. (1846–47 and 1851) of the *Mémoires de la Société d'Histoire de la Suisse Romande*.—MEREDITH READ. *Historic Studies in Vaud, Berne, and Savoy*, 2 vols. London, 1897.—M. SCHMITT. *Mémoires Historiques sur le Diocèse de Lausanne*, 2 vols. Fribourg, 1859.

Lavagna, a town of the province of Genoa, Liguria, Italy, 43 miles south-east of Genoa by rail, on the shore of the Mediterranean. The church of San Salvador has been proclaimed a national monument. Shipbuilding is carried on, slate and marble are quarried, and olive oil prepared. Population, about 7000.

Laval, chief town of the department of Mayenne, France, 187 miles west-south-west of Paris, on the railway from Paris to Brest. The chief industry is still nominally the same—the manufacture of *coutils* (tickings)—but "tickings" no longer adequately represents the character of the material produced. *Coutils* now include fabrics of different kinds, either wholly of linen or of cotton, or a mixture of both. The industry is carried on chiefly in

large factories, of which there are several in the suburb of Avenières. Population (1881), 23,534; (1891), 24,495; (1901), 30,356.

Laveleye, Émile Louis Victor de (1822–1892), Belgian economist, was born at Bruges on 5th April 1822, and educated there and at the Collège Stanislas, Paris, a celebrated establishment in the hands of the Oratorians. Thence he returned to Belgium, and continued his studies at the Catholic University of Louvain and afterwards at Ghent, where he came under the influence of Huet, the philosopher and Christian Socialist. In 1844 he won a prize with an essay on the language and literature of Provence. In 1847 he published *L'Histoire des rois francs*, and in 1861 a French version of the *Nibelungen*, but though he never lost his interest in literature and history, his most important work was in the domain of economics. He was one of a group of young lawyers, doctors, and critics, all old pupils of Huet, who met once a week to discuss social and economic questions, and was thus led to publish his views on these subjects. In 1859 some articles published by Laveleye in the *Revue des Deux Mondes* laid the foundation of his reputation as an economist. In 1864 he was elected to the chair of political economy at the State University of Liège. Here he wrote his most important works: *La Russie et l'Autriche depuis Sadowa* (1870), *Essai sur les formes de gouvernement dans les sociétés modernes* (1872), *Des causes actuelles de guerre en Europe et de l'arbitrage*, and *De la propriété et de ses formes primitives* (1874), dedicated to the memory of John Stuart Mill and François Huet. He died at Doyon, near Liège, on 3rd January 1892. De Laveleye's name is particularly connected with bimetalism and primitive property, and he took a special interest in the revival and preservation of small nationalities. But these subjects by no means exhausted the range of his activity, which included the whole realm of political science, political economy, monetary questions, international law, foreign and Belgian politics, questions of education, religion, and morality, travel and literature. He had the art of popularizing even the most technical subjects, owing to the clearness of his view and his firm grasp of the matter in hand. He was a frequent contributor to the *Revue des Deux Mondes*, *Revue de Belgique*, the *Nineteenth Century*, the *Fortnightly*, and the *Contemporary* reviews. He was especially attracted by England, where he thought he saw realized many of his ideals of social, political, and religious progress. The most widely circulated of Laveleye's works was a pamphlet on *Le parti clérical en Belgique*, of which 2,000,000 copies were circulated in ten languages.

Lavigerie, Charles Martial Allemand (1825–1892), cardinal archbishop of Carthage and Algiers and primate of Africa, was born at Bayonne, 31st October 1825. The son of a custom-house officer, he chose an ecclesiastical career, and came to St Sulpice, Paris, in 1840. He was ordained priest in 1849, and was professor of ecclesiastical history at the Sorbonne from 1854 to 1856. His superiors, however, soon discovered that he was an administrator as well as a scholar, and at the end of 1856 he accepted the direction of the schools of the East. He started shortly afterwards for Syria, and was thus for the first time brought into contact with the Mahommedan world. "C'est là," he wrote, "que j'ai connu enfin ma vocation." Activity in directing missionary work, and especially in alleviating the distresses of the victims of the Druses, soon brought him prominently into notice; he was made a chevalier of the Legion of Honour, and in October 1861, shortly after his return to Europe, was appointed French auditor at Rome. Two years later he was raised to the see of Nancy, where he

remained for four years, during which the diocese became one of the best organized and best administered in France. While bishop of Nancy he met Marshal MacMahon, then governor-general of Algeria, who in 1866, when the see of Algiers fell vacant, offered him the succession. It had already been raised to an archbishopric in July 1866, the transformation was authorized in August 1867, and Lavigerie landed in Africa on the 11th May following. The famine which was to decimate the native population was already making itself felt, and the archbishop began in November to collect the orphans into villages. This action, however, did not meet with the approval of MacMahon, who feared that the Arabs would resent the cessation of the religious peace, and thought that the Mahommedan Church, being a state institution in Algeria, ought to be protected from proselytism; so it was intimated to the prelate that his sole duty was to minister to the colonists. Lavigerie, however, continued his self-imposed task, refused the primacy of Lyons, which was offered to him by the emperor, and won his point. Contact with the natives during the famine caused Lavigerie to entertain exaggerated hopes for their general conversion, and his enthusiasm was such that he offered to resign his archbishopric in order to devote himself entirely to the missions. Pius IX. refused this, but granted him a coadjutor, and placed the whole of equatorial Africa under his missions. In 1870 Lavigerie warmly supported Papal infallibility. In 1871 he was twice a candidate for the National Assembly, but was defeated. In 1874 he founded the Sahara and Sudan Mission, and sent missionaries to Tunis, Tripoli, East Africa, and the Congo. The order of African missionaries thus founded, for which Lavigerie himself drew up the rule, has since become famous as the "Pères Blancs." From 1881 to 1884 his activity in Tunisia so raised the prestige of France that it drew from Gambetta the celebrated declaration, "L'Anticléricalisme n'est pas un article d'exportation," and led to the exemption of Algeria from the application of the decrees concerning the religious orders. On 27th March 1882 the dignity of cardinal was conferred upon Lavigerie, but the great object of his ambition was to restore the see of St Cyprian; and in that also he was successful, for by a bull of 10th November 1884 the primacy of Carthage was re-erected, and Lavigerie received the pallium on the 25th of January following. The later years of his life were spent in ardent anti-slavery propaganda, and his eloquence moved large audiences in London, as well as in Paris, Brussels, and other parts of the Continent. He hoped, by organizing a fraternity of armed laymen as pioneers, to restore fertility to the Sahara; but this community did not succeed, and was dissolved before his death. In 1890 Lavigerie appeared in the new character of a politician, and arranged with Pope Leo XIII. to make an attempt to reconcile the Church with the Republic. He then invited the officers of the Mediterranean Squadron to lunch at Algiers, and, practically renouncing his monarchical sympathies, to which he clung as long as the comte de Chambord was alive, expressed his support of the Republic, and emphasized it by hiring a band to play the "Marseillaise." The further steps in this evolution emanated from the Pope, and Lavigerie, whose health now began to fail, receded comparatively into the background. He died at Algiers on the 26th November 1892, and by his death France lost one of her most popular prelates and the anti-slavery cause one of its most zealous champions. (G. F. B.)

Lavos, a town of Portugal, district Coimbra, 4 miles south of Figueira da Foz, and on the south side of the estuary of the Mondego. Here the greater part of the British forces landed in 1808. In 1900 it had a population of 7967.

L A W.

I. UNITED KINGDOM.

THE last thirty years of the reign of Queen Victoria were rich in legal changes affecting as well the political constitution of the government and the social rights and obligations of the citizens of the United Kingdom as the machinery for the administration of the law. It is with the latter class of reforms, so far as they relate to England, that this article will chiefly deal. By far the most important legal reform, as regards both the magnitude of the interests concerned and the character of the changes made, was that effected by the passing of the Judicature Act, 1873 (36 and 37 Vict. c. 66). Any person who desires to know in a general way the constitution, jurisdiction, and practice of the Courts of Common Law and Equity, at the commencement of Queen Victoria's reign, should read the brilliant essay of the late Lord Bowen in *The Reign of Queen Victoria*, published in the Jubilee year 1887. Two systems of jurisprudence were administered by the Common Law Courts and by the Court of Chancery, differing from each other in their rules and methods, and in some respects antagonistic and even contradictory. One person might be recognized as the owner of an estate in the Common Law Courts, and another in the Court of Chancery. Each system had been built up on its own lines by a succession of eminent judges, and was within its limits logical and complete. But the practice in each system was bound fast by subtle distinctions and useless technicalities, and preserved anomalies which, however interesting to the legal historian, were devoid of all meaning to the modern practitioner. The Court of Chancery was a byword for dilatory proceeding and magnitude of expense. The number of judges in that court was insufficient for the work, while in the arrangements of the Common Law Courts there was a waste of the highest judicial ability. Between the year 1837 and the year 1873 much was done by the Common Law Procedure Acts and the Chancery Amendment Acts to reform the more obvious defects in the practice of the courts; but until the passing of the Judicature Act, 1873, the Courts of Common Law and the Court of Chancery retained and exercised their separate jurisdiction. The Court of Chancery still restrained a successful litigant in the Queen's Bench from enforcing his judgment, and so late as the year 1874 (the year before the Judicature Act came into force) a man who had a perfectly good title to relief lost his case in the Court of Chancery because he asked for an injunction, and it was held that his right was to damages, which was cognizable only in a Court of Common Law. His bill was dismissed with costs in Chancery, and he subsequently brought an action-at-law and succeeded (compare *Aspden v. Seddon*, L.R., 10 Ch. 394 with *Aspden v. Seddon*, L.R., 1 Ex.D. 496). The Court of Chancery still continued to conduct its cases by means of bill and answer. Only those who had to prepare these answers to written interrogatories know the weariness of the task—usually without much effect on the result of the case. Except in rare instances, evidence was still taken on affidavits, subject only to cross-examination before an Examiner in Rolls Yard. There was an efficient court of appeal in Chancery, but a writ of error from a Common Law Court to the Exchequer Chamber lay only in certain cases, and outside these limits there was no appeal.

The Judicature Act of 1873 was carried through Parliament by Lord Selborne, assisted by the Attorney-General and Solicitor-General (Sir J. D., afterwards Lord, Coleridge

and Sir George Jessel), and with the support of Lord Cairns. It was originally intended to come into operation on 2nd November 1874, but this date was altered by an Amending Act to 2nd November 1875. Various Amending Acts were subsequently passed, the twelfth of these being in the year 1899. These Acts together form the constitutional charter of the superior courts of England, and with the rules which have been made under them, regulate their jurisdiction, procedure, and practice. By the Act of 1873 the Court of Chancery, the Court of Queen's Bench, the Court of Common Pleas, the Court of Exchequer, the High Court of Admiralty, the Court of Probate, and the Court of Divorce and Matrimonial Causes were consolidated into one Supreme¹ Court of Judicature (sec. 3), divided into two permanent divisions, called "the High Court," with (speaking broadly) original jurisdiction, and "the Court of Appeal" (sec. 4). The reader will at once realize the bold and revolutionary character of this enactment. By one section of an Act the august Queen's Bench, the Common Pleas, in which serjeants only had formerly the right of audience, and the Exchequer, which had its origin in the reign of Henry I., and all their jurisdiction, criminal, legal, and equitable, were vested in the new court. Law and equity can be administered by every branch of the court, and a suitor can no longer be bandied from one court to another, or lose his action merely because he has brought it in a wrong court or sought an inappropriate remedy. Nor can a suitor be deprived of a judgment which he has obtained at common law by an injunction in a court of equity, but every defence, whether legal or equitable, can be raised in the court in which the action is brought (sec. 24). For the more convenient despatch of business, however, certain classes of actions are assigned to particular divisions of the High Court (secs. 22 and 24), and there is a power to transfer causes from one division to another.

There were originally three Common Law Divisions of the High Court corresponding with the three former Courts of Common Law. But after the death of Lord Chief Baron Kelly on the 17th September 1880, and of Lord Chief Justice Cockburn on the 20th November in the same year, the Common Pleas and Exchequer Divisions were (by Order in Council, 10th December 1880) consolidated with the Queen's Bench Division into one division under the presidency of the Lord Chief Justice of England, to whom, by the 25th section of the Judicature Act, 1881 (44 and 45 Vict. c. 68), all the statutory jurisdiction of the Chief Baron and the Chief Justice of the Common Pleas was transferred. The High Court, therefore, now consists of the Chancery Division, the Common Law Division, under the name of the King's Bench Division, and the Probate, Divorce, and Admiralty Division. To the King's Bench Division is also attached, by order of the Lord Chancellor (1st January 1884), the business of the London Court of Bankruptcy.

The Chancery Division originally consisted of the Lord Chancellor as President and the Master of the Rolls, and the three Vice-Chancellors. The Master of the Rolls was also a member of the Court of Appeal, but Sir George

¹ The comte de Franqueville in his interesting work, *Le Système Judiciaire de la Grande Bretagne*, criticizes the use of the word "supreme" as a designation of this court, inasmuch as its judgments are subject to appeal to the House of Lords, but in the Act of 1873 the appeal to the House of Lords was abolished. He is also severe on the illogical use of the words "division" and "court" in many different senses (vol. i. pp. 180-181).

Jessel, who held that office when the new system came into force, regularly sat as a Judge of First Instance until 1881 when, by the Act of that year (sec. 2) the Master of the Rolls became a member of the Court of Appeal only, and provision was made for the appointment of a judge to supply the vacancy thus occasioned (sec. 3). Sir James Bacon (b. 1798, d. 1895) was the last survivor of the Vice-Chancellors. He retained his seat on the Bench until the year 1886, when he retired after more than seventeen years' judicial service. For some reason the solicitors, when they had the choice, preferred to bring their actions in the Chancery Division. The practice introduced by the Judicature Act of trying actions with oral evidence instead of affidavits, and the comparative inexperience of the Chancery judges and counsel in that mode of trial, tended to lengthen the time required for the disposal of the business. Demand was consequently made for more judges in the Chancery Division. By an Act of 1877 (40 and 41 Vict. c. 9, secs. 2, 3) the appointment of an additional judge in that division was authorized, and Sir Edward Fry (afterwards better known as a Lord Justice) was appointed. In August 1899 the Crown consented to the appointment of a new judge of the High Court in the Chancery Division on an address from both Houses of Parliament, pursuant to the 87th section of the Appellate Jurisdiction Act, 1876 (39 and 40 Vict. c. 59), and in the following month of October Mr Justice Farwell was appointed. The Chancery Division, therefore, consisted in 1902 of the Lord Chancellor and six puisne judges. The latter are styled and addressed in the same manner as was customary in the old Common Law Courts.¹ Until lately there were only four judges of this division (being the successors of the Master of the Rolls and the three Vice-Chancellors) to whom chambers were attached. The fifth judge heard only causes with witnesses transferred to him from the overflowing of the lists of his four brethren. In each set of chambers there were three chief clerks, with a staff of assistant clerks under them. The chief clerks had no original jurisdiction, but heard applications only on behalf of the judge to whose chambers they belonged, and theoretically every suitor had the right to have his application heard by the judge himself in chambers. But the appointment of a sixth judge enabled the Lord Chancellor to carry out a reform recommended by a departmental committee, which reported in 1885. The great difficulty in the Chancery Division always was to secure the continuous hearing of actions with witnesses, as nearly one half of the judge's time was taken up with cases adjourned to him from chambers and other administrative business and non-witness actions and motions. The interruption of a witness action for two or three days, particularly in a country case, occasioned great expense, and had other inconveniences. It was a simple remedy to link the judges in pairs with one list of causes and one set of chambers assigned to each pair. This reform was effected by the alteration of a few words in certain rules of court. There were, therefore, in 1902 only three sets of chambers, each containing four chief clerks, or, as they are now styled, Masters of the Supreme Court, and one of the linked judges, by arrangement between themselves, continuously tries the witness actions in their common list,

while the other attends in chambers and also hears the motions, petitions, adjourned summonses, and non-witness cases.

Although styled Masters, it does not appear that the chief clerks have any larger or different jurisdiction than they had before. They are still the representatives of and responsible to the judges to whom the chambers are attached. The judge may either hear an application in chambers or may direct any matter which he thinks of sufficient importance to be argued before him in court, or a party may move in court to discharge an order made in chambers with a view to an appeal, but this is not required if the judge certifies that the matter was sufficiently discussed before him in chambers.

Under the existing rules of court many orders can now be made on summons in chambers which used formerly to require a suit or petition in court (see Order LV. as to foreclosure, administration, payment out of money in court and generally). The judge is also enabled to decide any particular question arising in the administration of the estate of a deceased person or execution of the trusts of a settlement without directing administration of the whole estate or execution of the trusts generally by the court (Order LV. rule 10), and where an application for accounts is made by a dissatisfied beneficiary or creditor to order the accounts to be delivered out of court, and the application to stand over till it can be seen what questions (if any) arise upon the accounts requiring the intervention of the court (Order LV. 2, 10a). Delay and consequent worry and expense are thus saved to the parties, and, at the same time, a great deal of routine administration is got rid of and a larger portion of the judicial term can be devoted to hearing actions and deciding any question of importance in court. The work of the chambers staff of the judges has probably been increased; but, on the other hand, it has been lightened by the removal of the Winding-up business. The Chancery Division has also inherited from the Court of Chancery a staff of registrars and taxing masters.

The King's Bench Division consists of the Lord Chief Justice and fourteen puisne judges. It exercises original jurisdiction and also appellate jurisdiction from the county courts and other inferior courts. *King's Bench Division.* By the Act of 1873 (sec. 45) this appellate jurisdiction is conferred upon the High Court generally, but in practice it is exercised by a Divisional Court of the King's Bench Division only. The determination of such appeals by the High Court is final, unless leave to appeal is given by the court which heard the appeal or by the Court of Appeal. There was an exception to this rule as regards certain orders of Quarter Sessions; the history of which involves some complication. But by sec. 1 (5) of the Act of 1894 the rule applies to all cases where there is a right of appeal to the High Court from any court or person. It may be here mentioned that if leave is given to appeal to the Court of Appeal there is a further appeal to the House of Lords, except in bankruptcy (47 Vict. c. 9, sec. 104 (a)), when the decision of the Court of Appeal on appeal from a divisional court sitting in appeal is made final and conclusive. It is suggested that under the new distribution of business in the Chancery Division, appeals from the county courts in equity and some other matters might advantageously go to two judges in that division.

There are masters in the King's Bench Division. Unlike the masters in the Chancery Division, they have original jurisdiction, and are not attached to any particular judge. They hear applications in chambers, act as taxing masters and occasionally as referees to conduct inquiries, take accounts, and assess damages. There is an appeal

¹ The comte de Franqueville comments on the misuse of the title "Lord" in addressing judges as another anomaly which only adds to the confusion, but perhaps unnecessarily. According to Foss (vol. viii. p. 200) it was only in the 18th century that the judges began to be addressed by the title of "Your Lordship." In the Year Books (he adds) they are constantly addressed by the title of "Sir." "Sir, vous voyez bien," etc.

from the master to the judge in chambers. Formerly there was an appeal from the judge in chambers to a divisional court in every case and thence to the Court of Appeal, until the multiplication of appeals in small interlocutory matters became a scandal. Under the Act of 1894 (57 and 58 Vict. c. 16, sec. 1) there is no right of appeal to the Court of Appeal in any interlocutory matters (except those mentioned in subs. (b)) without the leave of the judge or of the Court of Appeal, and in matters of "practice and procedure" the appeal lies (with leave) directly to the Court of Appeal from the judge in chambers.

The Probate, Divorce, and Admiralty Division consists of the president and one puisne judge. To it are assigned all causes and matters over which the Court of Probate, or the Court for Divorce and Matrimonial Causes, or the High Court of Admiralty had exclusive jurisdiction before the Judicature Act. But any cause or matter assigned to this division may be heard at the request of the President of the High Court by any other judge of the High Court. The union of the admiralty with the probate and divorce business in one division is an interesting relic of the time when the jurisdiction in admiralty, probate, and matrimonial causes was confined to the "civilians" in Doctors' Commons.

There are two registrars of the probate and divorce side of the division. In contentious matters they perform similar duties to those performed by the masters in the King's Bench Division, and during the long vacation they exercise most of the powers of the judges as to matters heard upon motion (20 and 21 Vict. c. 77, sec. 44). In non-contentious matters they issue grants of probate in common form and letters of administration, and exercise a general control over the procedure in the district registries of the court. There are a registrar and an assistant-registrar on the admiralty side of the division. The office of the registrar is of some antiquity. They hear interlocutory applications in pending actions, and they tax costs. The more important part of their duties is to act as referees on references to them, "assisted by merchants," to assess damages in collision and salvage cases, and to take accounts on all matters within the admiralty jurisdiction of the court.

The keystone of the structure is a strong Court of Appeal. Changes have from time to time been made in the constitution of this court.¹ As constituted in 1902, it consisted of *ex-officio* members and five ordinary members, who are styled Lords Justices of Appeal. The *ex-officio* members are the Lord Chancellor, every person who has held the office of Lord Chancellor, the Lord Chief Justice, the Master of the Rolls, and the President of the Probate, &c. Division. It usually sits in two divisions of three judges, under the presidency of the Master of the Rolls and the senior Lord Justice. The Lord Chancellor, when not engaged in the judicial business of the House of Lords, frequently sits in the court, and the other *ex-officio* judges also sit when their presence is required, owing to the absence of any of the Lords Justices from illness or public engagements. Lord Herschell, after he ceased to be Lord Chancellor, not unfrequently sat. All courts, however good, have a tendency to run in grooves, and it is eminently desirable to secure such variety in the composition and presidency of this court as will counteract that tendency, and command general confidence for their decisions. It was fortunate that the services were secured of such men (to

speak only of those who have gone) as Lord Selborne, Lord Cairns, Sir George Jessel, Lord Justice James, Lord Justice Mellish, Lord Bramwell, Lord Esher, Lord Justice Cotton, and Lord Bowen in building up the new system.

The jurisdiction of the Court of Appeal extends to (1) appeals from decrees and orders of all the divisions of the High Court; (2) appeals from the Court of Chancery of the county palatine of Lancaster; (3) appeals from the Court of Chancery of the county palatine of Durham (52 and 53 Vict. c. 47, sec. 11); (4) appeals from the railway commissioners on questions of law (51 and 52 Vict. c. 25, secs. 17 and 55); (5) applications for a new trial or to set aside a verdict, finding, or judgment after trial by a jury (53 and 54 Vict. c. 44, sec. 1); (6) appeals from the Lord Chancellor or any other person having jurisdiction in lunacy; (7) appeals from orders of the Liverpool Court of Passage (*Anderson v. Dean*, 1894, 2 Q.B. 222); (8) appeals from error on the record from the Lord Mayor's Court (*Le Blanche v. Heaton Telegram Co.*, 1 Ex.D. 408); and (9) last but not least, appeals from a county court judge or arbitrator on a case stated under the Workmen's Compensation Act, 1897, 60 and 61 Vict. c. 27, Sched. 2 (4). By a letter of request of the Lord Chancellor, under sec. 51 of the Lunacy Act (53 and 54 Vict. c. 5) the Lords Justices are entrusted with the jurisdiction of the judge in lunacy, and act as additional judges of the Chancery Division for the purpose of making orders in Chancery as well as lunacy when necessary. Practically, therefore, the Court of Appeal exercises the entire lunacy jurisdiction. It has been doubted whether the reference to the "Court of Appeal" in Sched. 2 (4) of the Workmen's Compensation Act, 1897, was not a mistake, and it has been thought that what was intended was the court exercising appellate jurisdiction from county courts, viz., a divisional court of the King's Bench Division. But the construction of the Act is free from ambiguity, and numerous appeals have been entertained, with the result that there is a further appeal in England to the House of Lords, whereas neither in Scotland nor (it is believed) in Ireland is there any such appeal. This, however, was not the only anomaly or difficulty in this singularly ill drawn Act. The jurisdiction of the Court of Appeal is subject to the following exceptions:—(1) orders of the High Court in appeals from inferior courts, unless leave be obtained of the court by which the order is made, or of the Court of Appeal; (2) orders of the High Court in registration and election cases without the like leave; (3) orders made by consent of parties, or as to costs only which by law are left to the discretion of the court; (4) certain interlocutory orders mentioned in sec. 1 of the Act of 1894 (57 and 58 Vict. c. 16); (5) orders made in any criminal cause or matter, save for some error of law apparent on the record, as to which no question shall have been reserved for the Court for Crown Cases Reserved; (6) orders of the Admiralty Division in cases of prize, the appeal from which lies to His Majesty in Council. The right of appeal is also subject to this limitation, that it does not extend to matters which from their nature were not appealable to any court before the Judicature Act, or in which the Court of Appeal has no means of enforcing or executing its judgment, and therefore it was held in the House of Lords, overruling the Court of Appeal, that no appeal lies from the order of a judge discharging a prisoner under a writ of *habeas corpus* (*Cox v. Hakes*, 15 A.C. 506). "If," said Lord Herschell, "the contention of the respondent is to prevail, the statute has effected a grave constitutional change"; and later, "if" the High Court "has inherited the combined powers of the courts whose functions were transferred to it, but none of them had any jurisdiction or authority to review a discharge by a

¹ 1875 (38 and 39 Vict. c. 77, sec. 4); 1881 (44 and 45 Vict. c. 68, secs. 2, 4); 1884 (47 and 48 Vict. c. 61, sec. 3); 1891 (54 and 55 Vict. c. 43, sec. 1).

competent court under a writ of *habeas corpus*, or to enforce the arrest of one thus freed from custody . . . it seems to me to follow, that however wrong the Court of Appeal might think a discharge to have been, it would have been powerless to order a rearrest or at least to enforce such an order." The question whether an appeal would lie from order of the High Court refusing a writ of *habeas corpus* was left open.

"In the Court of Appeal," says the editor of the *Judicial Statistics* for 1899,¹ "there was a large increase of business during that year. The appeals entered rose from 767 to 826, and were 28·76 in excess of the average for 1894-98. The increase was chiefly in appeals under the Workmen's Compensation Act. Out of a total of 826 appeals entered those under this Act were 140, or 16·95 per cent. of the whole." The list of appeals at the commencement of each successive sittings during the years 1900-1901 showed a steady increase in the numbers waiting to be heard. It was not very clear how these arrears were to be overtaken. An addition to the number of ordinary members of the Court of Appeal would not achieve that end, unless arrangements could be made for the court to sit (temporarily at least) in three divisions; and it would not do to weaken the authority of the court. And while a special commission might be appointed, the difficulty was that the House of Lords and judicial committee could not spare any of their members.

The order of the Court of Appeal is final in appeals from the High Court in Bankruptcy, unless leave be given to appeal to the House of Lords (sec. 104 Bankruptcy Act, 1883) and in divorce appeals, except where the decision either is upon the grant or refusal of a decree for dissolution or nullity of marriage or for a declaration of legitimacy, or is upon any question of law on which the court gives leave to appeal (44 and 45 Vict. c. 68, sec. 9), but no further appeal to the House of Lords lies, even with leave of the Court of Appeal, on appeals from the High Court sitting as a court of appeal from county courts in bankruptcy. With these exceptions, there is now a right of appeal from every order of the Court of Appeal to the House of Lords. By sec. 20 of the Act of 1873, the appellate jurisdiction of the House of Lords (so far as it affects England) was abolished, but this section was repealed by the Act of 1876. Experience has probably convinced most persons of the wisdom of retaining a final court of appeal.

The practice and procedure of the supreme court are regulated by rules made by a committee of judges, to which have been added the president of the Incorporated Law Society, and a practising barrister and one other person nominated by the Lord Chancellor. The rules in force in 1902 were those of 1883, with some subsequent amendments. With the appendices they filled a moderately-sized volume. Complaints are made that they are too voluminous and go into too much detail, and place a burden on the time and temper of the busy practitioner which he can ill afford to bear. In the opinion of the writer, the authors of the rules attempted too much, and it would have been better to provide a simpler and more elastic code of procedure. Rules have sometimes been made to meet individual cases of hardship, and rules of procedure have been piled up from time to time, sometimes embodying a new experiment, and not always consistent with former rules. It is, however, proverbially easy to criticize.

The most important matter dealt with by the rules is the mode of pleading. The authors of the *Judicature Act*

had before them two systems of pleading, both of which were open to criticism. The common-law pleadings (it was said) did not state the facts on which the pleader relied, but only the legal aspect of the facts or the inferences from them, while the Chancery pleadings were lengthy, tedious, and to a large extent irrelevant and useless. There was some exaggeration in both statements. In pursuing the fusion of law and equity which was the dominant legal idea of law reformers of that period, the framers of the first set of rules devised a system which they thought would meet the defects of both systems, and be appropriate for both the common law and the Chancery divisions. In a normal case, the plaintiff delivered his statement of claim, in which he was to set forth concisely the facts on which he relied, and the relief which he asked. The defendant then delivered his statement of defence, in which he was to say whether he admitted or denied the plaintiff's facts (every averment not traversed being taken to be admitted), and any additional facts and legal defences on which he relied. The plaintiff might then reply, and the defendant rejoin, and so on until the pleaders had exhausted themselves. This system of pleading was not a bad one if accompanied by the right of either party to demur to his opponent's pleading, *i.e.*, to say, "admitting all your averments of fact to be true, you still have no cause of action," or "defence" (as the case may be). The writer, however, thinks that the authors of the new system were too intent on uniformity when they abolished the common-law pleading, which, shorn of its abuses (as it had been by the Common Law Procedure Acts), was an admirable instrument for defining the issue between the parties, though unsuited for the more complicated cases which are tried in Chancery, and he thinks it would have been better to try the new system in the first instance in the Chancery Division only. It should be added that the rules contain provisions for actions being tried without pleadings if the defendant does not require a statement of claim, and for the plaintiff in an action of debt obtaining immediate judgment unless the defendant gets leave to defend. In the Chancery Division there are of course no pleadings in those matters which by the rules can be disposed of by summons in chambers instead of by ordinary suit as formerly.

The judges seem to have been dissatisfied with the effect of their former rules, for in 1883 they issued a fresh set of consolidated rules, which, with subsequent amendments, were those in force in 1902. By these rules a further attempt was made to prune the exuberance of pleading. Concise forms of statement of claim and defence were given in the appendix for adoption by the pleader. It is true that these forms do not display a high standard of excellence in draftsmanship, and it was said that many of them were undoubtedly demurrable, but that was not of much importance. Demurrers were abolished, and instead thereof it was provided that any point of law raised by the pleadings should be disposed of at or after the trial, provided that by consent or order of the court the same might be set down and disposed of before the trial (Ord. xxv. 22. 1, 2). In the opinion of the writer, this was a disastrous change. The right of either party to challenge his opponent *in limine*, either where the question between them was purely one of law, or where even the view of the facts taken and alleged by his opponent did not constitute a cause of action or defence, was a most valuable one, and tended to the curtailment of both the delay and the expense of litigation. Any possibility of abuse by frivolous or technical demurrers (as undoubtedly was formerly the case) had been met by powers of amendment and the infliction of costs. Many of the most important questions of law had been decided on demurrer both in common law and Chancery.

¹ *Judicial Statistics*, 1899, p. 20.

In the writer's experience it was a useful and satisfactory mode of trying questions in Chancery (on bill and demurrer), and was frequently adopted in preference to a special case, which requires the statement of facts to be agreed to by both parties and was consequently more difficult and expensive. It is obvious that a rule which makes the normal time for decision of questions at law the trial or subsequently, and a preliminary decision the exception, and such exception dependent on the consent of both parties or an order of the court, is a poor substitute for a demurrer as of right, and it has proved so in practice. The editors of the *Yearly Practice* (by Messrs Muir Mackenzie, Lushington, and Fox, 1901) say (p. 272), "Points of law raised by the pleadings are usually disposed of at the trial or on further consideration after the trial of the issues of fact," that is to say, after the delay, worry, and expense of a trial of disputed questions of fact which after all may turn out to be unnecessary. The abolition of demurrers has also (it is believed) had a prejudicial effect on the standard of legal accuracy and knowledge required in practitioners. Formerly the pleader pleaded with the fear of a demurrer before him. Nowadays he need not stop to think whether his cause of action or defence will hold water or not, and anything which is not obviously frivolous or vexatious will do by way of pleading for the purpose of the trial and for getting the opposite party into the box.

Another change was made by the rules of 1883, which was regarded by some common-law lawyers as revolutionary. Formerly every issue of fact in a common-law action, including the amount of damage, had to be decided by the verdict of a jury. "The effect of the rules of 1883," says Lord Lindley, who was a member of the Rule Committee, "was to make trial without a jury the normal mode of trial, except where trial without a jury is ordered under rules 6 or 7a, or may be had without an order under rule 2" (Timson and Wilson, 38 Ch.D. 72, at p. 76). The effect of the rules may be thus summarized. (1) In the Chancery Division no trial by jury unless ordered by the judge. (2) Generally the judge may order trial without a jury of any cause or issue, which before the Judicature Act might have been so tried without consent of parties, or which involves prolonged investigation of documents or accounts, or scientific or local investigation. (3) Either party has a right to a jury in actions of slander, libel, false imprisonment, malicious prosecution, seduction, or breach of promise of marriage, upon notice without order; (4) or in any other action, by order. (5) Subject as above, actions are to be tried without a jury unless the judge, of his own motion, otherwise orders.

Further steps have been taken with a view to simplification of procedure. By Order xxx. 21 (as amended in 1897), a summons, called a summons for directions, has to be taken out by a plaintiff immediately after the appearance of the defendant, and upon such summons an order is to be made respecting pleadings, and a number of interlocutory proceedings. To make such an order at that early stage would seem to demand a prescience and intelligent anticipation of future events which can hardly be expected of a master, or even a judge in chambers, except in simple cases, involving a single issue of law or fact which the parties are agreed in presenting to the court. The effect of the rule is that the plaintiff cannot deliver his statement of claim, or take any step in the action without the leave of the judge. The writer is informed that in Chancery cases the order usually made is that the plaintiff deliver his statement of claim, and the rest of the summons stand over, and the practical effect is merely to add a few pounds to the costs. It may be doubted whether, as applied to the majority of actions, the rule

does not proceed on wrong lines, and whether it would not be better to leave the parties, who know the exigencies of their case better even than a judge in chambers, to proceed in their own way, subject to stringent provisions for immediate payment of the costs occasioned by unnecessary vexatious or dilatory proceedings. The order does not apply to Admiralty cases or to proceedings under the order next mentioned.

In Order xviii. a (made in November 1893), the Committee took a bolder flight. A plaintiff is thereby allowed to dispense with pleadings altogether, provided that the indorsement of his writ of summons contains a statement sufficient to give notice of his claim, or of the relief or remedy required in the action, and states that the plaintiff intends to proceed to trial without pleadings. The judge may, on the application of the defendant, order a statement of claim to be delivered or the action to proceed to trial without pleadings, and if necessary particulars of the claim or defence to be delivered. Out of this order grew what is called the Commercial Court. This is not a distinct court or division or branch of the High Court, and is not regulated by any special rules of court made by the Rule Committee. It originated in a notice issued by the Judges of the Queen's Bench Division, in February 1895 (see W.N., 2nd March 1895), the provisions contained in which represent only "a practice agreed on by the judges, who have the right to deal by convention among themselves with this mode of disposing of the business in their courts" (per Lord Esher in *Barry v. Peruvian Corporation*, 1896, 1 Q.B. p. 209). A separate list of causes of a commercial character is to be made and assigned to a particular judge, charged with commercial business, to whom all applications before the trial are to be made. The 8th paragraph is as follows:—

(8) Such judge may at any time after appearance and without pleadings make such order as he thinks fit for the speedy determination, in accordance with existing rules, of the questions really in controversy between the parties.

Practitioners before Sir George Jessel, at the Rolls, in the years 1873 to 1880, will be reminded of his mode of ascertaining the point in controversy and bringing it to a speedy determination. Obviously the scheme is only applicable to cases in which there is some single issue of law or fact, or the case depends on the construction of some contract or other instrument or section of an Act of Parliament, and such issue or question is either agreed upon by the parties or at once ascertainable by the judge. The success of the scheme must also depend largely on the personal qualities of the judge to whom the list is assigned. Under the able guidance of Mr (afterwards Lord) Justice Mathew, the Commercial Court became very successful in bringing cases to a speedy and satisfactory determination without any technicality or unnecessary expense, and the business is increasing.¹ The question occurs why the same experiment should not be tried with actions of other descriptions. Why should not lists be assigned to other selected judges, who should deal with them in the same way as the judge to whom the commercial list is assigned deals with his actions? Such a practice might go far to meet the complaint frequently made, and not without some foundation, of the time expended in the trial of actions, when in the result the real question between the parties turns out to be one of law or an issue of fact, capable of more summary treatment. Complaint is also made by counsel and solicitors in the King's Bench Division, that they cannot ascertain in which court, or, even approximately, when their cases will come on for trial until the evening on which they are placed in the list for the following day. This would be

¹ *Judicial Statistics*, 1899, p. 21.

met by assigning his own list to every judge appointed to try actions, as is in fact done in the Chancery Division. And why should not the system of "linked judges," adopted in the Chancery Division, be extended to the other division, and a list be assigned at the commencement of every sittings to each pair of judges, and even (if the suggestion does not shock susceptibilities) a master or masters be specially attached to each pair? One judge might then proceed, continuously with the list whilst the other was engaged on circuit, or in chambers, or in a divisional court, or elsewhere.

By sec. 23 of the Judicature Act, 1875, power is conferred on the Crown, by Order in Council, to make regulations

Circuits. respecting circuits, including the discontinuance of any circuit, and the formation of any new circuit, and the appointment of the place at which assizes are to be held on any circuit. Under this power an Order of Council, dated the 5th February 1876, was made, whereby the circuit system was remodelled. A new circuit, called the North-Eastern Circuit, was created, consisting of Newcastle and Durham taken out of the old Northern Circuit, and York and Leeds taken out of the Midland Circuit. Oakham, Leicester, and Northampton, which had belonged to the Norfolk Circuit, were added to the Midland. The Norfolk Circuit and the Home Circuit were abolished and a new South-Eastern Circuit was created, consisting of Huntingdon, Cambridge, Ipswich, Norwich, Chelmsford, Hertford, and Lewes, taken partly out of the old Norfolk Circuit and partly out of the Home Circuit. The counties of Kent and Surrey were left out of the circuit system, the assizes for these counties being held by the judges remaining in London. Subsequently Maidstone and Guildford were united under the revived name of the Home Circuit for the purpose of the summer and winter assizes, and the assizes in these towns were held by one of the judges of the Western Circuit, who, after disposing of the business there, rejoined his colleague in Exeter. In 1899 this arrangement was abolished, and Maidstone and Guildford were added to the South-Eastern Circuit. Other minor changes in the assize towns were made, which it is unnecessary to particularize. Birmingham first became a circuit town in the year 1884, and the work there became, by arrangement, the joint property of the Midland and Oxford Circuits. There are alternative assize towns in the following counties, viz. :—On the Western Circuit, Salisbury and Devizes for Wiltshire, and Wells and Taunton for Somerset; on the South-Eastern, Ipswich and Bury St Edmunds for Suffolk; on the North Wales Circuit, Welshpool and Newtown for Montgomery; and on the South Wales Circuit, Cardiff and Swansea for Glamorgan.

According to the arrangements in force in 1902 there were four assizes in each year. There were two principal assizes, viz., the winter assizes, beginning in January, and the summer assizes, beginning at the end of May. At these two assizes criminal and civil business was disposed of in all the circuits. There were two other assizes, viz., the autumn assizes and the Easter assizes. The autumn assizes were regulated by Acts of 1876 and 1877 (39 and 40 Vict. c. 57, and 40 and 41 Vict. c. 46) and Orders of Council made under the former Act. They were held for the whole of England and Wales, but for the purpose of these assizes the work was to a large extent "grouped," so that not every county had a separate assize. For example, on the South-Eastern Circuit Huntingdon was grouped with Cambridge; on the Midland, Rutland was grouped with Lincoln; on the Northern, Westmorland was grouped with Cumberland; and the North Wales and South Wales Circuits were united, and no assizes were held at some of the smaller towns. At these assizes criminal business only was taken, except at Manchester,

Liverpool, Swansea, Birmingham and Leeds. The Easter assizes were held in April and May on two circuits only, viz., at Manchester and Liverpool on the Northern and at Leeds on the North-Eastern. Both civil and criminal business was taken at Manchester and Liverpool, but criminal business only at Leeds.

Other changes had been made, with a view to preventing the complete interruption of the London sittings in the Common Law Division by the absence of the judges on circuit. The assizes were so arranged as to commence on different dates in the various circuits. For example, the summer assizes began in the South-Eastern and Western Circuits on 29th May; in the Northern Circuit on 28th June; in the Midland and Oxford Circuits on 16th June; in the North-Eastern Circuit on 6th July; in the North Wales Circuit on 7th July; and in the South Wales Circuit on 11th July. Again, there had been a continuous development of what may be called the single-judge system. In the early days of the new order the members of the Court of Appeal and the judges of the Chancery Division shared the circuit work with the judges in the Common Law Division. This did not prove to be a satisfactory arrangement. The assize work was not familiar and was uncongenial to the Chancery judges, who had but little training or experience to fit them for it. Arrears increased in Chancery, and the Appeal Court was shorn of much of its strength for a considerable part of the year. The practice was discontinued in or about the year 1884. The Appeal and Chancery judges were relieved of the duty of going on circuit, and an arrangement was made by the Treasury for making an allowance for expenses of circuit to the Common Law judges, on whom the whole work of the assizes was thrown. In order to cope with the assize work, and at the same time keep the Common Law sittings going in London, an experiment, which had been previously tried by Lord Cairns and Lord Cross (then Home Secretary) and discontinued, was revived. Instead of two judges going together to each assize town, it was arranged that one judge should go by himself to certain selected places—practically, it may be said, to all except the more important provincial centres. The only places to which two judges went in 1902 were Exeter, Winchester, Bristol, Manchester, Liverpool, Nottingham, Stafford, Birmingham, Newcastle, Durham, York, Leeds, Chester, and Cardiff or Swansea.

It could scarcely be said that, even with the amendments introduced under Orders in Council, the circuit system was altogether satisfactory or that the last word had been pronounced on the subject. In the first report of the Judicature Commission, dated 25th March 1869, p. 17 (*Parl. Papers*, 1868-69), the majority report that "the necessity for holding assizes in every county without regard to the extent of the business to be transacted in such county leads, in our judgment, to a great waste of judicial strength and a great loss of time in going from one circuit town to another, and causes much unnecessary cost and inconvenience to those whose attendance is necessary or customary at the assizes." And in their second report, dated 3rd July 1872 (*Parl. Papers*, 1872, vol. xx.), they dwell upon the advisability of grouping or a discontinuance of holding assizes "in several counties, for example, Rutland and Westmorland, where it is manifestly an idle waste of time and money to have assizes." In the opinion of experienced persons, the defects thus pointed out have not been adequately remedied. It is thought that such towns as Oakham¹ and

¹ It appears from the *Judicial Statistics*, 1899 (pp. 21, 22), that no actions were entered or tried in that year at Brecon, Mold, Oakham and Welshpool, or Newtown, and in no less than sixteen towns five or fewer actions had been entered and tried during the preceding six years.

others might even cease to be assize towns; that the grouping of counties which has been effected for the autumn assizes might be carried still further and applied to all the assizes; and that the system of holding the assizes alternately in one of two towns within a county might be extended to two towns in adjoining counties, for example, Gloucester and Worcester. The facility of railway communication renders this reform comparatively easy, and reforms in this direction have been approved by the judges, but ancient custom and local patriotism, interests, or susceptibility bar the way. Nor can it be said that the single-judge system has been altogether a success. When there is only one judge for both civil and criminal work, he properly takes the criminal business first. He can fix only approximately the time when he can hope to be free for the civil business. If the calendar is exceptionally heavy or one or more of the criminal cases prove to be unexpectedly long (as may easily happen), the civil business necessarily gets squeezed into the short residue of the allotted time. Suitors and their solicitors and witnesses are kept waiting for days, and after all perhaps it proves to be impossible for the judge to take the case, and a "remanet" is the result. It is the opinion of persons of experience that the result has undoubtedly been to drive to London much of the civil business which properly belongs to the provinces, and ought to be tried there, and thus at once to increase the burden on the judges and jurymen in London, and to increase the costs of the trial of the actions sent there. Some persons advocate the continuous sittings of the High Court in certain centres, such as Manchester, Liverpool, Leeds, Newcastle, Birmingham, and Bristol, or (in fact) a decentralization of the judicial system. There is already an excellent court for Chancery cases for Lancashire in the County Palatine Court, presided over by the Vice-Chancellor, and with a local bar which has produced many men of great ability and even eminence. The Durham Chancery Court is also capable of development. Another suggestion has been made for continuous circuits throughout the legal year, so that a certain number of the judges, according to a rota, should be continuously in the provinces while the remaining judges did the London business. The value of this suggestion would depend on an estimate of the number of cases which might thus be tried in the country in relief of the London list. This estimate it would be difficult to make. Mr Justice Kennedy, to whom the writer is indebted for valuable assistance in this portion of the article, expresses the opinion that it is essential in any changes that may be made to retain the occasional administration by judges of the High Court of criminal jurisdiction, both in populous centres and in remote places. It promotes a belief in the importance and dignity of justice and the care to be given to all matters affecting a citizen's life, liberty, or character. It also does something, by the example set by judges in country districts, to check any tendency to undue severity of sentences in offences against property.

In connexion with the trial of actions, reference may be made to the Arbitration Act, 1889 (52 and 53 Vict. c. 49).

This Act is both a consolidating Act and an amending Act, and is, in fact, a concise code of the law relating to the subject. By the common law, no agreement to refer between parties ousted the jurisdiction of the courts of the sovereign, or could be pleaded in bar of an action by one of the parties for the same matter, though where the right of action was only for a sum of money to be ascertained by arbitration, the award of the arbitrator was a condition precedent to the action, which could not therefore be maintained until the arbitrator had made his award (*Scott v. Avery*, 5 H.L.

811). But this general rule of law was modified by sec. 11 of the Common Law Procedure Act, 1854,¹ by which a party to a submission, and persons claiming through him, were enabled, if an action was brought by another party to the submission, to apply to the court to stay the proceedings, and the court was empowered (but not obliged) to make an order to that effect. The result was to enable the party sued to obtain, under certain conditions, specific performance of the agreement to refer. This provision is repeated with some variation of language in sec. 4 of the Arbitration Act. Again, by the common law either party might revoke the authority of a particular arbitrator at any time before the award. This was modified by legislation (9 and 10 Will. III. c. 15, and 3 and 4 Will. IV. c. 42), with the result that where the submission might be made a rule of court there was no power to revoke without the leave of the court. The Common Law Procedure Act, 1854, enabled any submission to be made a rule of court unless it was otherwise provided in the submission. By sec. 1 of the Arbitration Act a submission, unless a contrary intention appears therein, is made irrevocable except by leave of the court, and is declared to have the same effect in all respects as if it had been made an order of court. The effect of the latter words is that an award without the submission having been made a rule of court can be enforced as a judgment of the court, and thus to abolish the necessity in such a case of bringing a fresh action on the award, but by sec. 12 the leave of the court must be obtained. By sec. 14 (which is substituted for sec. 57 of the Judicature Act, 1873) the court is empowered in any civil proceeding, (a) by consent, (b) where a prolonged examination of documents or scientific or local investigation is required, (c) in matters of account, to refer the whole cause or matter or any question or issue of fact therein either to a special referee or arbitrator agreed upon by the parties or to an official referee or officer of the court. It will thus be seen that facilities have been afforded for giving effect to agreements by the parties referring their differences to arbitration and for compulsory arbitration, where matters can be more conveniently dealt with in that manner. On the other hand, assistance is given to arbitrators in the performance of their duties, and the parties are protected against the consequence of mistakes in law by arbitrators by sec. 7 (b), which enables arbitrators to state an award wholly or partly in the form of a special case for the opinion of the court, and sec. 19, which enables an arbitrator at any stage of the proceedings, and obliges him, if so directed by the court, to state in the form of a special case for the opinion of the court any question of law arising in the course of the reference. The arbitrator is not bound to state a case at the request of either of the parties, but his refusal to do so would lead to an application to the court for an order upon him, and, if not justifiable, might amount to misconduct on his part. Practically, therefore, any party to a reference may remove the decision of any real question of law from the arbitrator to the court. There is an appeal to the Court of Appeal, and thence to the House of Lords from the High Court on a case stated under sec. 7, but it has been held that there is no appeal on a case stated under sec. 19, because (it is said) the office of the court is consultative only, and what the court pronounces is an opinion and not an order. (In re *Knight*, 1892, 2 Q.B. 613. In re *Kirkleatham Board*, 1893, 1 Q.B. 375.)

Inquiry may now be made as to the results of the new procedure. The expected fusion of law and equity is not complete, because in the nature of things it cannot be so.

¹ 17 and 18 Vict. c. 125.

In English jurisprudence law and equity deal with different classes of subjects, and, to a large extent, proceed on different lines and by different methods. But equity, as well as law, is now cognizable in all the courts; procedure has been simplified, and technicalities have been reduced to even a dangerous minimum. The more important part of the work of the old courts in banc is now done by the Court of Appeal, but their shadow, under the name of a divisional court, still survives. The divisional court is an obsolete institution, and ought to be abolished, except as a court of appeal from inferior courts. The multiplication of appeals in the earlier stages of an action has been mitigated, and, with a better organization of the Common Law Courts and judicial staff, still further steps might be taken in reducing the expenses of the initial stages of actions. It is difficult to say whether either in the King's Bench or the Chancery Division the costs of trial have been reduced, because so many elements enter into the examination. In the latter case they have probably been increased, because trial by oral evidence takes longer and is more expensive than trial by affidavit evidence. Circumlocution and delay in Chancery (the favourite theme of the novelist and satirist) are things of the past, and the expenses of the administrative business of the division have certainly been reduced without any loss of efficiency. Actions come on for trial within a reasonable time after they are ready. During the six years 1894 to 1899¹ the business in the Chancery Division appeared to be nearly stationary, with a tendency to decrease in some heads. The number of actions heard in 1899 was 575, which is smaller than the number heard in 1898, but somewhat greater than the average of the previous four years. In the Queen's Bench Division there was for several years a regular and marked decrease of the business until the year 1897. In that year there were 69,050 writs and other originating proceedings and 2743 actions heard, while in the year 1898 there was a still further increase, the number of writs and other originating proceedings being 71,375, and 3266 actions were heard. On the other hand, in 1899 the figures were 68,464 writs and other originating proceedings and 2704 actions tried.² It should be added that the percentage of actions entered in the list for speedy trial of actions under Order XIV. showed a distinct increase of actions so tried, both actual and proportional.³ The average time which elapsed between date of writ and trial of action was estimated to be 194·8 (say 195) days, or, if cases of an exceptional kind were eliminated, 125·7 days.

The outward and visible sign of the passing of the old order was given when the judges left their historical home in Westminster Hall for the new Palace of Justice in the Strand in the year 1882, and law and equity forgathered under one roof. Vast as it is, the new building is not adequate for the accommodation of all its inmates, and a judge in 1902 still sat in old Lincoln's Inn Hall. At the time of the opening of the new courts it was remarked that those who were responsible for their arrangement had apparently forgotten that the Court of Appeal sat in two divisions. There is a large hall which leads nowhere, and is as silent and deserted as Westminster Hall itself. The corridors are dark and narrow. The accommodation for counsel in the courts is confined and inconvenient, and the furniture is bare and mean. There is no room in which counsel can wait for their cases to be called on except the library, which is upstairs and unfitted for the purpose. The

**Royal
Courts of
Justice.**

accommodation for the judges, on the other hand, is excellent.

Bankruptcy proceedings were in 1902 regulated by the Bankruptcy Act, 1883 (46 and 47 Vict. c. 52), amended by an Act of 1890 (53 and 54 Vict. c. 71), and in minor details by other Acts. There has been a curious change of policy in this branch of legal administration. Under the Act of 1849 the bankrupt's property was administered by two assignees, one of whom, called the official assignee, was an officer of the court, and the other was chosen by the creditors. In 1869 this procedure was reversed, and under the Act of that year there was one trustee only chosen by the creditors, and facilities were given for administration of an insolvent's estate outside the court, under deeds of arrangement. The Act of 1883 reintroduced officialism. All bankruptcies were placed under the administration of the Board of Trade, and officers of this department (called official receivers) managed the estate until, and unless, another trustee was chosen by the creditors. Alterations were at the same time made in the procedure on a petition of bankruptcy against a debtor. Instead of an immediate adjudication the court made what was called a receiving order, the effect of which was to place the property under the care of an official receiver and to protect it against action by other creditors (sec. 9). A general meeting of the creditors was then held for the purpose of considering whether a proposal for a composition, if made by the debtor, or a scheme of arrangement should be entertained, or whether the debtor should be adjudged bankrupt, and generally as to the mode of dealing with the debtor's property (sec. 15), and a public examination of the debtor was held, at which any creditor might attend and question the debtor (sec. 17). If the creditors resolved on a bankruptcy or came to no decision, or if any composition which might be proposed was not accepted and approved by the court, an adjudication in bankruptcy ensued (sec. 20). The creditors, or the committee of inspection (where one was appointed), selected the trustee (sec. 21). Until one was appointed (sec. 54), and during any vacancy in the office (sec. 87 (4)) the official receiver acted as trustee. The punitive part of bankruptcy administration was strengthened. The court now had an absolute discretion to grant or refuse an order of discharge or suspend the operation of the order for a specified time, or to grant the order subject to any conditions as to the bankrupt's future earnings or after-acquired property, except that no order of discharge could be made where the bankrupt had been guilty of certain offences, which were made misdemeanours, and an absolute order might not be made where the bankrupt had been guilty of other offences enumerated in sec. 28 (3). The vesting of a discretion in the court as to the order of discharge was again a return to the principle of the Act of 1849. Under the Act of 1861, as subsequently amended in 1869, it was held that the court had no discretion, and that on complying with the prescribed conditions the bankrupt was entitled to his discharge unless he had been guilty of any of the offences mentioned in the Act (In re *Mew and Thorne*, 31 L.J. Bank. 87, and Ex parte *Hamilton*, 9 Ch.D. 694). Other novel features in the Act of 1883 were, the power of the court to order summary administration where the official receiver reported that the estate was not likely to exceed in value £300 (sec. 121); the power of a county court judge to make an immediate administration order where the debtor's whole indebtedness did not exceed £50 (sec. 122), and the jurisdiction given to the Bankruptcy Court to administer the estate of a deceased debtor according to the law of bankruptcy (sec. 125). Original jurisdiction in bankruptcy is exercised in the London district by a judge of the High Court assigned

¹ *Judicial Statistics*, 1898, 1899. ² *Ibid.*, 1899, pp. 75, 76.

³ *Ibid.*, 1898, 1899.

by the Lord Chancellor for that purpose, subject to an appeal to the Court of Appeal, but not to the House of Lords without leave of the latter court. The jurisdiction in the country districts is exercised by the County Courts whatever be the amount of the estate, subject to an appeal to a divisional court of the High Court, of which the judge to whom bankruptcy business is assigned shall be a member. There is no further appeal without leave of the Divisional court or the Court of Appeal, and (where leave is given) no further appeal to the House of Lords—see sec. 2 of the Bankruptcy Appeals County Courts Act, 1884 (47 Vict. c. 9), repealing sec. 104 (2) (A) of the Act of 1883, which provided for appeals from the County Courts in bankruptcy to the Court of Appeal directly. The Lord Chancellor may exclude any County Court from the exercise of bankruptcy jurisdiction.

It is difficult to form any estimate as to the improvement in efficiency or costs effected by the Bankruptcy Act, 1883. As regards large estates, where it is worth while for the creditors to look after their own interests and the percentage of the costs on the value of the estate is less, probably there is no great change. Indeed, comparatively few of these estates ever come into bankruptcy. They are usually wound up under deeds of arrangement. The bulk of the bankruptcies are of small estates where the percentage of expenses of liquidation is large and dividends are infrequent. It is sometimes said that the tendency of the official receivers is to sacrifice the assets for the sake of an immediate return. This is perhaps inevitable, and it must be remembered that creditors are impatient and few estates will bear the expense of a prolonged bankruptcy or of "nursing" the assets. The report of the Inspector-General in Bankruptcy for the year ending 31st March 1900 contained some interesting statistics which illustrate the working of the Act. There were 720 effective receiving orders made in the High Court and 3363 in the County Courts, and 713 adjudications made in the High Court and 3332 in the County Courts. Summary administration under sec. 121 was ordered in 511 cases in the High Court and 2881 in the County Courts. No composition was approved by the court for a less sum than 7s. 6d. in the £. There were 3823 estates wound up by official receivers and closed during the year 1899. Of these in no less than 1734 the assets were under £25. The gross assets in these cases amounted to £18,915, the percentage of costs on gross assets was 96.35, and the total amount paid in dividends was £502 only, or, in other words, the estates were practically absorbed in costs. As the estates increase in value up to £2000 the percentage of costs decreases, being 17.38 only in estates between £1500 and £2000, and the proportionate amount paid in dividends increases. There were 16 estates between £1000 and £2000. The average percentage of costs in these was about 15.9. There were only four estates of £2000 and upwards, viz., one estate between £2000 and £3000, one between £4000 and £5000, one between £5000 and £6000, and one over £20,000. In the last-mentioned case the gross assets were £40,032, the percentage of costs was 4.51 only, and no less than £38,046 was paid in dividends. Table VII. contained an analysis of the results of administration of 738 estates wound up by non-official trustees during the same year, of which 158 were above £1000 in value as compared with cases in the previous table. The percentage of costs is generally higher, but the proportionate amount paid in dividends to the gross assets is larger, and it appears from a subsequent table that rather more than one-fifth were closed without dividend, whereas rather less than three-fifths were so closed in the estates wound up by official trustees. Roughly, therefore, the estates which paid no dividend under official

administration were twice as many as those wound up by non-official trustees. These statistics show that in the larger estates, and in those which are expected to yield a dividend, the creditors prefer to have the estates wound up by trustees of their own selection, but the costs in that case are rather higher.

Consistently with its policy of officialism, the Act of 1883 contained no power for an insolvent debtor and the majority of his creditors to come to an arrangement between themselves binding on all the creditors outside the court. Conveyance by a debtor of his property in trust for his creditors does not therefore protect a debtor from bankruptcy, unless assented to by all his creditors, and is, moreover, itself an act of bankruptcy. Estates, however, continued to be wound up under deeds of arrangement, whether in the form of an assignment, or composition, or inspectorship deed. By the Deeds of Arrangement Act, 1887 (50 and 51 Vict. c. 57) every deed of arrangement is made void unless registered with the registrar of bills of sale within seven days of its first execution by the debtor or any creditor, but the Act gives no validity to any deed or instrument which by law is an act of bankruptcy or void or voidable. By a subsequent Act (53 and 54 Vict. c. 71, sec. 25) provision is made for a report to Parliament by the Board of Trade of proceedings under the above Act, and for return to the Board by the registrar of all deeds registered and by the trustee thereof of his receipts and payments. The Inspector-General in Bankruptcy in his Report for 1899, already quoted, criticized severely the administration of insolvent estates under deeds of arrangement, and pointed to instances of abuses and hardship to creditors. No doubt liquidation by private arrangement is exposed to many abuses and dangers from which official administration is comparatively free. But for all that, it seems that some persons among the commercial classes prefer private arrangements to bankruptcy proceedings. It appears from the Inspector-General's report that 3162 deeds were registered in the year 1899, of which 188 were cancelled by subsequent receivership orders, leaving 2974 estates to be wound up privately, of the total estimated value of £1,774,321. Final accounts were rendered during the year of the administration of 2338 estates under deeds of arrangement, in fifteen of which the gross assets were £6000 and upwards. The estates closed without payment of a dividend were 9.97, or, say, one-tenth, and in the majority of cases the dividends were between 2s. 6d. and 7s. 6d. in the £. The percentage of costs on gross assets is not appreciably higher (if at all) than in estates wound up either by official receivers or non-official trustees in bankruptcy. These statistics prove, not that liquidation by private arrangement is superior generally to that in bankruptcy, but that many people think that it is, and they prefer to have the best estates wound up in that manner.

By the Companies (Winding Up) Act, 1890 (53 and 54 Vict. c. 63), the winding up of companies also was placed under the administration of the Board of Trade and the official receivers. The aim of this Act was as far as possible to assimilate the procedure of winding up insolvent companies to that in bankruptcy. The analogy is of course imperfect, because there is no individual or personal insolvent debtor to be dealt with, and the attempt to impose some of the obligations and penal provisions of the Bankruptcy Act upon directors of insolvent companies is neither just in principle nor expedient in practice. For some few years after the passing of the Act, directors (whether alleged to have been guilty of fraud or not) were frequently called upon by the official receivers to submit themselves to the trying ordeal of a public examination under sec. 8, in which the

Companies winding up.

official receiver, the liquidator (where the official receiver is not the liquidator), and any creditor or contributory of the company may take part either personally or by solicitor or counsel. But it was decided in the House of Lords (*ex parte Barnes*, 1896, A.C. 146) that an order could not be made for the public examination of any person against whom a *prima facie* case of fraud had not been found by the report of the official receiver. The general effect of the Act is thus summed up by Mr Justice Buckley in his work on the Companies Act (7th ed. p. 671): "The first section and the whole Act which follows are addressed solely to administration. There is to be found in the Act no alteration of rights, but only an alteration of the courts and officers and mode of selection of officers who are to administer those rights, with detailed provisions as to financial control and subsidiary matters." The reader may be reminded that there were three modes of winding up provided by the Companies Act, 1862:—(1) Voluntary winding up by resolution of the members; (2) voluntary winding up under the supervision of the court; and (3) compulsory winding up by the court on the petition of a creditor or contributory in case of insolvency, and in certain other cases specified in sec. 79 of the Act of 1862. The effect of a supervision order is to leave the liquidators to exercise their powers without the sanction or intervention of the court in the same manner as if the company were being wound up altogether voluntarily, but to enable the court, when called upon, to exercise all the coercive jurisdiction which it might exercise if it were a winding up by the court (sec. 151 of the Act of 1862), and the order usually contains a power for creditors to apply to the court as well as the liquidator and contributories. The Act of 1890, speaking generally, deals only with winding up by the court, but some sections (notably sec. 10) apply to voluntary liquidations also. The winding up business is no longer the exclusive property of the Chancery Division, and one incidental benefit conferred by the Act is the relief thus afforded to the over-burdened chambers of that division. It was provided (sec. 1) that where the capital of the company paid up or credited as paid up exceeded £10,000, a petition for a winding up or supervision order should be presented to the High Court, with concurrent jurisdiction to the two Palatine courts of Lancaster and Durham as regards companies within their jurisdiction. When the capital did not exceed £10,000, and its registered office was within the jurisdiction of a County Court having jurisdiction, the petition was to be presented to that County Court. The County Courts having jurisdiction were those having jurisdiction in bankruptcy, with power to the Lord Chancellor to exclude any court from winding up jurisdiction. The jurisdiction of the High Court was exercised by a judge of the Chancery Division assigned by the Lord Chancellor, or by the judge exercising the bankruptcy jurisdiction of the court (sec. 2). In practice the winding up business has hitherto been assigned to the bankruptcy judge, who has been made a judge of the Chancery Division for that purpose. The official receiver is the provisional liquidator, and the definitive liquidator of the company, unless another person is appointed official liquidator by the court on the application of creditors or contributories (secs. 4–6). But whether the official receiver be appointed liquidator or not, he exercises a large control over the course of the winding up under secs. 7 and 8, which require a statement of affairs to be submitted to him, and require him to make certain reports to the court, including a report whether in his opinion any fraud has been committed by any person in the formation of the company, or by any director or other officer since its formation. Upon such last-mentioned report the court may order the public examination of the person whose conduct

is impugned (see *ex parte Barnes*, referred to above). The Board of Trade also takes cognizance of the conduct of liquidators of companies which are being wound up by order of the court, and either *mero motu*, or on the application of any creditor or contributory, may inquire into his conduct and take action thereon (sec. 25). Secs. 15 and 20 contain what are perhaps the most useful provisions in the Act. By sec. 15 (which applies to voluntary liquidations as well as windings up by the court) every liquidator after the expiration of the first year is required at stated intervals (by the rules twice in every year) to send to the Registrar of Joint-Stock Companies a full statement and account with respect to the proceedings in and position of the liquidation, and monies in his hands representing assets unclaimed or undistributed for six months are required to be paid into the Bank of England. And sec. 20 provides for an audit by the Board of Trade twice a year of the accounts of every liquidator of a company which is being wound up by the court. This provision might with advantage have been applied with some modification to voluntary liquidations.

There is no doubt more notoriety about winding up proceedings under the new system of procedure. The Inspector-General in Bankruptcy makes his yearly report to Parliament on Companies in Liquidation. The provision for the rendering of accounts and audits of accounts are admirable as far as they go, and have done much to mitigate frequent abuses in the liquidation of companies. But in the actual administration of the estate and recovery of monies recoverable from promoters and officers of the company on the ground of fraud, breach of trust, or negligence, it may be doubted whether any great improvement or change can be discerned. Probably (as in bankruptcy) in the larger estates things remain pretty much as they were, but in the smaller estates, where there is very little for either creditors or contributories, the winding up is effected with greater despatch. In his report for the year ending 31st March 1901 the Inspector-General stated that there were during that year 1687 voluntary liquidations, of which 38 were subject to supervision and 117 compulsory liquidations by order of the court. Some of the voluntary liquidations (estimated by the Inspector-General in a previous report at one-fourth of the number) were for the purpose of reconstruction or amalgamation with other companies. On this basis the number of bankrupt companies for the year would be 1372. In the estates, the winding up of which was completed in the years 1898, 1899, and 1900, the percentage of costs on gross assets was decidedly least in the purely voluntary liquidations, and remarkably so in the larger estates, and less in the companies wound up under supervision than in the compulsory liquidations under order of the court, whether by the official receiver or by non-official liquidators, but the percentage in companies wound up by official receivers is less than in those wound up by non-official liquidators. It must, however, be remembered that in the voluntary liquidations some (say one-fourth) were formal liquidations for the purpose of reconstruction or amalgamation, and also that the amount of the costs depends very much upon the circumstances of the particular company and the amount of litigation involved, and where the percentage is based on an average of a few companies only, as in the larger estates, one unusually expensive liquidation unduly affects the result. Moreover, litigation is more likely to take place in windings up under the order of the court. The Inspector-General's Comparative Table II. (p. 74 of the Report) therefore does not afford much assistance in arriving at a comparative estimate of the expenses of the two modes of liquidation.

The Companies Act, 1862 (25 and 26 Vict. c. 89), has

been in almost daily use, and under its provisions joint-stock enterprise in England has been developed to enormous dimensions. A committee appointed by the Board of Trade in 1895 stated in their Report¹ (p. vi.) :—

According to the recent report of the Board of Trade, there were in the United Kingdom, in April 1894, 18,361 companies with a paid-up capital of £1,035,029,835, whereas the capital of all companies in France, *anonymes* and *en commandite*, was, in December 1894, calculated approximately at £420,000,000. The capital of German companies was estimated by Mr Gerb of H.M. Consulate-General in Berlin at £200,000,000, but Mr Schuster puts it at £300,000,000. The capital embarked in English companies, therefore, exceeds that represented by French and German companies together by at least £315,000,000.

Notwithstanding a continuous criticism of the Act of 1862, comparatively few serious questions of construction have arisen, and judged by results the Act must be regarded as a great success. It was amended by the Act of 1867 (30 and 31 Vict. c. 131). This Act was chiefly concerned with the reduction of capital by order of the Court, but it contained two obscurely expressed sections, each of which has led to a vast amount of litigation, and in some cases oppression to individuals without any great advantage to anybody. The 25th section provided for every share being deemed to have been issued subject to the payment of the whole amount thereof in cash, unless otherwise determined by a contract in writing filed at or before the issue of the share. Under this section persons who had taken shares represented to be fully paid up in payment of a debt or purchase-money of property, have not only got nothing, but have had to pay large sums in addition. The other section is the 38th, which (to state the effect of it shortly) provided for the date and names of the parties to any contract entered into by the company, or the promoters, directors, or trustees thereof, being specified in a prospectus, and declared that any prospectus not specifying the same shall be deemed fraudulent on the part of the persons issuing the same. This section was full of difficulties of construction, and both sections were examples of well-intentioned but inconsiderate and, therefore, mischievous legislation. The Act of 1862 has been further amended or added to in some minor details, as well as by the Companies Winding Up Act, 1890. In the year 1900 the Companies Act of that year (63 and 64 Vict. c. 48) was passed. This Act was founded on a proposed Bill scheduled to the Report of the Committee of 1895 already referred to, and was designed to meet some of the more flagrant abuses which have been found to attend the formation and management of joint-stock companies. That such abuses too frequently exist there is no doubt, but unfortunately the dishonest cases are those which strike the public eye. The affairs of the vastly greater number of companies are stated in the Report of the Committee to be conducted with honesty and capacity. It is just at this point that the difficulty of legislation arises. For, while endeavouring to anticipate and counteract the devices of professional promoters and others, the legislator has to be on his guard against imposing such fetters and onerous obligations on directors as will deter men of character and substance from accepting the office. Again, an Act of Parliament cannot endow a rogue with honesty, or his dupe with sagacity, or the imprudent with wisdom. All it can do is to require such information and means of information to be given as will enable an intending subscriber to protect himself. At the same time the maxim *caveat emptor* has no application to the relation of such a person towards the persons who invite his subscription, for any adequate investigation into the statements of a

prospectus is beyond the powers of many people, and could not practically be undertaken in the time allowed between the receipt of the prospectus and the closing of the subscription list. The obligations of a person who issues a prospectus ought not, therefore, to be limited to that which the law imposes on vendors and parties to an ordinary contract of making no misrepresentation. He should be placed in what is called a "fiduciary position" for this purpose towards those to whom the prospectus is addressed, and bear the duty of not only telling what he believes to be or has been informed is the truth, but also of doing his best to ascertain the truth and disclosing in good faith every fact within his knowledge which is material for the consideration of the investor. Some people have inferred from certain expressions of noble lords in *Central Railway Co. of Venezuela v. Kisch* (L.R. 2 H.L. 99) that this was in fact the law, but it has been decided in *Derry v. Peek* (14 A.C. 337) that directors who issue a prospectus can only be made personally liable for wilful misrepresentation in an action of deceit. The Directors' Liability Act (53 and 54 Vict. c. 64) went some way in the suggested direction. The Act of 1900 follows the plan of requiring certain specified particulars to be stated in the prospectus (sec. 10). The section is indeed comprehensive, and it is difficult to suggest anything which ought to be stated and is not included. It is, however, the opinion of some reformers that it would have been better policy and more scientific legislation to enact the broad principle, and leave the courts to work it out in detail.

There are, however, at least four valuable provisions in the Act of 1900. It requires a statement in every prospectus of the minimum subscription on which the directors will proceed to allotment, and in the absence of such statement forbids any allotment unless the whole capital offered is subscribed (secs. 4, 5). The absence of such a provision has been a most fruitful cause of disaster. A man who only intended to become a shareholder in a company with a capital of (say) £100,000, finds himself saddled with shares in a company which has failed to obtain subscriptions for one-tenth of that amount. An attempt is made (sec. 12) to give vitality to the first meeting of shareholders required to be held by sec. 29 of the Act of 1862. Certain information has to be given, and the shareholders have the opportunity of considering their position before they are finally embarked on the adventure. An attempt is also made (sec. 10 (1) (f) and (2)) to unmask the "nominal vendor" (who plays a large part in companies' promotion), and to discover the intermediate profits made between the real vendor and the purchasing company. By secs. 14 to 18 a register of securities is to be kept by the Registrar, subject to public inspection. Every charge created (1) as security for debentures, (2) on uncalled capital, (3) on "personal chattels" within the Bills of Sales Acts, and (4) a floating charge on the company's undertaking, is made void as against the liquidator and creditors unless registered within twenty-one days after execution. Finally, secs. 25 and 38 of the Companies Act, 1867, are repealed (schedule), and less objectionable modes provided for attaining the same result.

One novel feature is to be found in sec. 8 of the Act of 1890, whereby it is declared lawful to pay out of the company's funds either a commission on underwriting or a brokerage for placing shares, provided such payment is authorized by the articles of association and does not exceed the amount so authorized, and the payment is mentioned in the prospectus; otherwise such payments are prohibited. Mr Justice Buckley, in his book on the Companies Acts (7th ed. p. 610), considers that the legality of the payments of brokerage or commission for placing

¹ Report of Departmental Committee appointed by the Board of Trade, presented to Parliament in 1895.

shares, after some conflicting opinions in the courts, was settled by the case of *Metropolitan Association v. Scrimgeour* (1895, 2 Q.B. 604). A distinction has been made between the payment of brokerage and that of an underwriting commission, but there does not appear to be any real difference in principle. Whether legal or not, such payments were so generally made, either directly out of the company's funds, or indirectly by adding the amount to the price paid to the vendor who made them, that it was no doubt considered better to legalize them under certain restrictions. But the bearing of this section on

Shares at a discount.

the issue of shares at a discount will have to be considered. Such issue has been decided by the House of Lords to be inconsistent with the provisions of the Companies Act, 1862, either as between the company and its creditors (*Ooregum Company v. Roper*, 1892, A.C. 125), or as between the company and its members (*Wilton v. Saffery*, 1897, A.C. 299, diss. Lord Herschell). But if the company may pay 1s. per share to A for inducing B to take a £1 share, there does not seem to be any sound reason why the company should not pay the same sum to A if he takes the share himself, and indeed the payment of a commission to an underwriter is, or may be, a direct payment or return to the shareholder himself off the nominal amount of his share. The issue of shares at a discount excites an unreasonable prejudice in some minds. It is allowed to companies incorporated under the Companies Clauses Acts on the issue of new shares (26 and 27 Vict. c. 118, as amended by 30 and 31 Vict. c. 127, ss. 27-29), and in other companies the prohibition may be evaded, or at least the same result attained, with the greatest ease. For example, on a new issue the shares may be £10 shares, with a 10 per cent. preference dividend, and the articles may provide that the shareholders shall receive £20 for each share on distribution of surplus assets in a winding up and have twice the voting power of other £10 shareholders. How does this differ in substance from the issue of a £20 share with a 5 per cent. preference dividend at a discount of 50 per cent.? In the opinion of the writer the issue of shares at a discount might safely be permitted in circumstances and under conditions similar to those prescribed for companies under the Companies Clauses Acts. Another anomaly of company law is illustrated by what are called "one-man companies." A man may turn a business, of which he is sole proprietor, into a limited company, with the assistance of six clerks or members of his family, to whom he gives one share a piece, taking the rest of the capital himself. He may thus carry on business with limited liability, defy the bankruptcy law, and even issue debentures to himself which will have priority over the trade creditors (*Salomon v. Salomon and Co.*, 1897, A.C. 22). The Act of 1862 (sec. 6) requires seven persons associated for a lawful purpose to form a company, and so much importance is attached to the number of seven, that the failure to maintain that number of shareholders is made a cause of winding up by the Court (sec. 79 (3)). It may be assumed that the creation of "one-man companies" was not contemplated by the framers of the Act of 1862, but no person has ever suggested a practical remedy (if one be desired) which would be consistent with the scheme of the Acts, and not do more harm than good. The point is not touched by the Act of 1900. That Act is not the last word on company reform, but it contains some good provisions, and may do some good, and probably no harm.

Contemporaneously with the Bankruptcy Act, 1883, the Patents, Designs, and Trade Marks Act, 1883 (46 and 47 Vict. c. 57) was passed. By this Act (which has been

subsequently amended in some details not affecting the general scheme of the Act by Acts of 1885, 1886, and 1888) the administration of the law as to patents, copyright in designs, and trade marks is carried on in one office called the Patent Office, under the immediate control of an officer called the comptroller-general of patents, designs, and trade marks, who acts under the superintendence and direction of the Board of Trade (sec. 82). The Board of Trade is empowered by sec. 101 to make rules and do such things as it thinks expedient, subject to the provisions of the Act, for regulating the practice of registration under the Act, and other ancillary purposes, and generally for regulating the business of the Patent Office. The Act deals chiefly with the machinery for making applications for and granting patents and registration of designs and trade marks, and but few changes have been made in substantive law. The application for a patent is made to the comptroller, accompanied by a provisional specification. It is then referred to an examiner to report whether the nature of the invention has been fairly described, whether the application, specification, and drawings (if any) have been prepared in the prescribed manner, and whether the title sufficiently indicates the subject matter of the invention (sec. 6). The reader will notice the limited scope of the duties of the examiner. He does not, for instance, report on the novelty of the invention having regard to previous patents. If the examiner reports unfavourably the comptroller may require an amendment and vary the date so as to make the application run from the time when the amendment is made (Patents Act, 1888, 51 and 52 Vict. c. 10, sec. 2). Under the Patent Law Amendment Act, 1852, all provisional specifications were published. Under the present Acts they are now only published after the complete specification has also been filed, and not at all if the application is abandoned (Patents Act, 1885, 48 and 49 Vict. c. 63, sec. 4). The complete specification must be left at the Patent Office within nine months from the date of application (sec. 8 (1)), with power for the comptroller to extend the term for not exceeding one month (Act of 1885, sec. 3). The complete specification is again referred to the examiner, and if accepted the comptroller advertises his acceptance, and any person may within two months oppose the grant on various specified grounds, including the ground that the invention has been patented in Great Britain on an application of prior date (secs. 9, 10, and 11). The comptroller hears the parties and gives his decision on the case, but there is an appeal to the law officer (either the Attorney-General or the Solicitor-General) from the comptroller's decision on this question, as well as from the other decisions of the comptroller of each stage of the proceedings. The law officer's decision is final. He has therefore to exercise important judicial functions, but where there is a serious question to be tried the practice is for the law officer to allow the grant to be made, leaving the opponents to assert their right in a court of law. Increased facilities for amending a complete specification, after grant of a patent, are given by sec. 18, and restrictions are placed on the recovery of damage in respect of infringement before amendment by sec. 20. The proceeding by *scire facias* to repeal a patent is abolished, but revocation of a patent may be obtained on petition to the Court by the Attorney-General or any other person authorized by him, or, speaking generally, any person aggrieved by the grant of a patent (sec. 25). There are two alterations of substantive law which should be noticed. By sec. 22 the Board of Trade is empowered in certain defined cases to order the patentee to grant licences on such terms as the Board may deem just, and any such order may be enforced by

**Patents,
designs,
and trade
marks.**

mandamus. And by sec. 27 a patent has the like effect against the Crown as it has against a subject, but with power to the officers of the Crown to use the invention for the service of the Crown on terms agreed upon, or in default of agreement to be settled by the Treasury. Formerly the rule was otherwise, the Crown not being bound, unless expressly named in the terms of the grant (*Feather v. The Queen*, 6 B. and S. 257).

The practice in trials of patent actions remains unaltered, except that in a claim for infringement or a proceeding for revocation the Court may at any time give the patentee, on terms, liberty to apply for leave to amend his specification by way of disclaimer, and postpone the trial in the meantime (sec. 19). No attempt has been made, nor perhaps can successfully be made, by legislation to limit the length and expense of patent actions, for which the parties are chiefly responsible. Something may be done by the judge, no doubt, to limit the number of expert witnesses or curtail the cross-examination, but it is always a delicate matter for the judge to interfere with the discretion of counsel, when the exclusion of evidence may involve defeat in the Courts of Appeal, or, at best, a new trial. Frequently when the case is heard on appeal it is found that the questions both of validity of the patent and infringement turn on the construction of the specification, on which the expert evidence is of little assistance.

It is unnecessary to comment on the procedure prescribed for applications to the comptroller for registration of designs and trade marks. The appeal from decisions of the comptroller is to the Board of Trade, which has power to refer the matter to the High Court, and usually does so in a case of any difficulty. One incidental result of the registration of trade marks (first established in 1875) deserves notice. Formerly no distinction was made, and it was not necessary to make any distinction between trade marks and trade names, meaning a name which by usage has come to denote the goods of a particular person or firm in the market. Many of the cases described as trade mark cases are really cases of a trade name. But trade names are not within the Trade Marks Acts. Consequently a person may still prove his right to a trade name and prevent the use of it on the goods of another person, although as a trade mark it does not fulfil the conditions required by the Acts, and is therefore incapable of registration. The jurisdiction of the Court is undoubted, and is founded on elementary principles of mercantile morality (see the cases of *Montgomery v. Thompson*, 1891, A.C. 217, and *Reddaway v. Banham*, 1896, A.C. 199, both in the House of Lords). But a distinction must be made between the name attached to a new article introduced by a manufacturer, in the sale of which he has no monopoly, and a name denoting the manufacture of a particular person (see the Cellular Clothing Company's case, 1899, A.C. 326). If all the world may manufacture and sell the goods, they may *prima facie* describe them by the name by which they are known in the market.

The County Courts (remarks the comte de Franqueville) are at once the most ancient and the most modern of English civil tribunals. The Saxon Curia Comitatus, maintained after the Norman Conquest, was a local court and a small debts court. But otherwise it had little similarity to the County Courts founded in the year 1846 by an Act (9 and 10 Vict. c. 95) with the modest title of "An Act for the Recovery of Small Debts and Demands in England." The original limit of the jurisdiction of the new courts was £20, but this was extended in 1850 to £50 in actions of debt. Thirteen amending Acts were passed, by which new jurisdiction was from time to time conferred on the County Courts, and

in the year 1888 an Act (51 and 52 Vict. c. 43 was passed) repealing the previous Acts and consolidating their provisions, with some amendment. This is now the code or charter of the County Courts. The grain of mustard-seed sown in 1846 has grown into a goodly tree, with branches extending over the whole of England and Wales; and they embrace within their ambit a more multifarious jurisdiction than is possessed by any other courts in the kingdom. England and Wales were mapped out into 59 circuits (not including the City of London), with power for the Crown, by Order in Council, to abolish any circuit and rearrange the areas comprised in the circuits (sec. 4). This power has been exercised, and there are now 54 circuits only. There is at present one judge to each circuit, but the Lord Chancellor is empowered to appoint two judges in a circuit, provided that the total number of judges does not exceed 60. Every circuit (except in Birmingham, Clerkenwell, and Westminster) is divided into districts, in each of which there is a court, with a registrar and bailiffs. The judges are directed to attend and hold a court in each district at least once in every month, unless the Lord Chancellor shall otherwise direct (secs. 10, 11). But in practice, says Judge Snagge,¹ the judge sits several times a month in the large centres of population, and less frequently than once a month in the court town of sparsely inhabited districts. By sec. 185 of the Act of 1888 the judges and officers of the City of London Court have the like jurisdiction, powers, and authority as those of a County Court, and the County Court rules apply to that Court.

The ordinary jurisdiction of the County Courts is thus tabulated by Judge Snagge:—

Subject matter.	Pecuniary limit of jurisdiction.
Common-law actions, with written consent of both parties	Unlimited.
Actions founded on contract (except for breach of promise of marriage, in which the County Courts have no jurisdiction)	£50.
Actions founded on tort (except libel, slander, and seduction, in which the County Courts have no jurisdiction)	£50.
Counter claims (unless plaintiff gives written notice of objection)	Unlimited.
Ejectment or questions of title to realty	£50 annual value.
Equity jurisdiction	£500.
Probate jurisdiction	£200 personalty and £300 realty.
Admiralty jurisdiction	£300.
Bankruptcy jurisdiction	Unlimited.
Replevin	Unlimited.
Interpleader transferred from High Court	£500.
Actions in contract transferred from High Court	£100.
Actions in tort transferred from High Court Companies (winding up), when the paid-up capital does not exceed	Unlimited.
	£10,000.

There is no discoverable principle upon which these limits of the jurisdiction of the County Courts have been determined. For example, it is difficult to understand why a County Court should be trusted to try an action of debt for £100 when transferred from the High Court, but not when commenced in the Court itself. Yet it has been so decided on the construction of a badly-drawn section (sec. 85 of the Act of 1888) in *Curtis v. Stovin* (22 Q.B.D. 513). But the above table is not by any means an exhaustive statement of the jurisdiction of the County Courts. For many years it has been the practice of Parliament to throw on the County Court judges the duty of acting as judges or arbitrators for the purpose of new legislation relating to social subjects. Judge Snagge writes,² "A

¹ "Fifty Years of the English County Courts," by His Honour Judge Snagge, in the *Nineteenth Century*, October 1897, which contains an exhaustive review of the whole subject.

² *Nineteenth Century*, October 1897, p. 567.

mere catalogue of these Acts of Parliament would fill a couple of pages, but a short alphabetical list of a few of them may serve by way of illustration:—

Agricultural Holdings Act, 1883.
 Bankruptcy Act, 1883.
 Coal Mines Regulation Act, 1881.
 Debtors Act, 1869.
 Employers' Liability Act, 1880.
 Friendly Societies Act, 1875.
 Guardianship of Infants Act, 1886.
 Habitual Drunkards Act, 1879.
 Industrial Assurance, &c., Act, 1896.
 Law of Distress Amendment Act, 1888.
 Mercantile Law Amendment Act, 1856.
 Open Shares, &c., Act, 1890.
 Public Health Act, 1875.
 Railways Regulation Act, 1871.
 Settled Land Acts, 1882-90.
 Tithe Act, 1891; and (last but not least)
 Workmen's Compensation for Injuries Act, 1897."

It appears from the judicial statistics for 1899¹ that there were in that year 1,152,163 complaints entered in the County Courts to recover sums amounting altogether to £3,485,698. The number of complaints is smaller, but the amount sued for is slightly larger than the corresponding figures for 1898. On the whole the number of complaints has been steadily increasing, and in 1901 there were nearly twice as many as there were in 1889. There were also 1618 actions remitted from the High Court during the year 1899. These figures do not include proceedings in bankruptcy, winding up, and other matters.

There is an appeal from the County Courts on matters of law in all cases where the debt or damage or claim in interpleader exceeds £20, and in actions for the recovery of land exceeding £20 in yearly value, to a divisional court of the High Court, *i.e.*, to the Admiralty Division in Admiralty cases and to the King's Bench Division in other cases (sec. 120 of Act of 1888). The determination of the divisional court is final, unless leave be given by that court or the Court of Appeal (Judicature Act, 1894, sec. 1 (5)). But if leave be given there is a further appeal from the Court of Appeal to the House of Lords, except in bankruptcy (47 Vict. c. 9, sec. 2). In proceedings under the Workmen's Compensation Act, 1897 (as we have seen), the appeal from a County Court judge is to the Court of Appeal, with a subsequent appeal to the House of Lords.

The County Courts may have a still greater future. The Judicature Commissioners in their second report² suggested that the jurisdiction of the County Courts over common-law actions might be made unlimited, with power for defendants to demand a transfer to the High Court. This suggestion (as has been seen) was not adopted, but in the process of decentralization (which seems inevitable) the County Courts may hereafter become local courts of first instance for legal business of every description, without limit of jurisdiction, leaving the courts in London to do the appeal business and the London business proper, with power to remove any action to London for trial for stated reasons.

Few alterations have been made in the administration of the criminal business in the courts during the period under review. Between 1875 and 1880 an attempt was made to consolidate and codify the criminal law of England. The subject was referred to a commission, consisting of Lord Blackburn, Lord Justice Lush, Mr Justice Barry (of the Irish Bench), and Mr Justice Stephen, and upon their report a Bill was introduced by Lord Justice Holker, then Attorney-General, but it did not become law, and has not since

been introduced.³ The same fate befell a Bill brought in by Lord James of Hereford, when he was Attorney-General, in 1884, for the establishment of a court of criminal appeal. There is a great difference of opinion as to the expediency of a court of criminal appeal, and, as usually happens, the difference is aggravated by persons not exactly realizing what it is they mean. The King's Bench Division (Crown side) and the Court of Crown Cases Reserved exist for the purpose of correcting errors of law which appear on the record in a criminal case, or which arise in the course of the trial, and act as courts of cassation for that purpose. If their jurisdiction is not wide enough to embrace all cases of legal error in criminal trials, let it be amended. The supporters of a court of criminal appeal, however, point to the anomaly of an appeal on facts existing in every civil case affecting property, but there being none in cases affecting a subject's liberty or even life. The statement is not correct. There is no appeal from the verdict of a jury in a civil case where there was evidence for their consideration, but only a right to a new trial where the verdict is against the weight of evidence; and under the rule of Lord Esher a new trial on this ground was practically unattainable. What they really want is a re-trial by the court, and that the court should do formally what the Home Secretary does informally. On the other hand, it is urged that it would have a bad effect on juries to take from them the sense of the finality of their verdict and consequent responsibility. One use of a court of criminal appeal would be to attain some general standard in the sentences on convicted persons. In the opinion of the writer a court might safely be established for granting new trials where the verdict is against the weight or (say) preponderance of evidence, or where fresh evidence can be adduced, and with power to diminish but not increase sentences.

By the Criminal Evidence Act, 1898 (60 and 61 Vict. c. 36) a prisoner, or the wife or husband of a prisoner, is made a competent witness for the defence at every stage of the proceedings, subject to certain conditions, of which the principal are that a prisoner shall not be called except on his or her own application, and the failure of the prisoner or his wife or her husband to give evidence is not to be the subject of comment by the prosecution, and the prisoner cannot be cross-examined as to any previous offence or conviction or as to character, unless the proof of a previous offence is admissible evidence in the case, or he or she has given evidence of his or her good character, or cross-examined with that view. A party, therefore, is now competent to give evidence on his or her own behalf, both in civil and criminal matters.

Attention may now be called to other legal reforms which do not relate to the machinery for administration of the law, but deal with subjects of first-rate importance and directly touch administration, more particularly in the Chancery Division of the High Court.

The Conveyancing Act, 1881 (44 and 45 Vict. c. 41, amended by 45 and 46 Vict. c. 39) simplifies and improves the practice of conveyancing. It vests in trustees, mortgagees, and others various powers commonly conferred by provisions inserted in settlements, mortgages, wills, and other instruments. It prescribes what matters covered by general words shall be deemed to be included, and what covenants for title shall be implied in conveyances of land. And it amends, in certain particulars, the law of

Legal reforms affecting administration.

³ It may be of interest to observe that a Code of Criminal Law following with some amendments the Bill of 1880 has been passed by the Parliament of New Zealand, and a similar Code, founded largely on the Report, has been passed by the Parliament of Queensland.

¹ *Judicial Statistics*, 1899, pp. 42, 147.

² *Parliamentary Paper*, 1872, No. 631.

property. But the Act does not lay down or proceed upon any new departure in principle.

Lord Cairns's Settled Land Act, 1882 (45 and 46 Vict. c. 38, amended in details by three subsequent Acts of 1885, 1889, and 1890¹) is an Act of a different character. The general scheme of these Acts

**Settled
Land Acts.**

is to invest the tenant for life of a settled estate with all the powers of management and disposition which are enjoyed by a fee-simple owner. A tenant for life is empowered to sell the estate (sec. 24) or the heirlooms held with it (sec. 37). But he cannot sell the principal mansion-house, its pleasure-grounds, park, and land usually occupied there, without the consent of the trustees of the settlement or of the court (53 and 54 Vict. c. 69, sec. 10), or the heirlooms without an order of the court (Act of 1882, sec. 37 (3)), and in case of any sale he has to give notice to the trustees (sec. 45 (1)). A tenant for life is required to have regard to the interests of all parties, and is to be deemed to be in the position and to have the duties and liabilities of a trustee for those parties (sec. 53). What the effect of this section is, beyond requiring the tenant for life to use reasonable means of selling to the best advantage without any profit to himself or reservation in his own favour, it is not easy to see. He is made the absolute judge whether the estate shall be sold or not, and it is no objection to a sale that the necessity for it arises from his own extravagance or improvidence, or that it is for his own relief, or that all the other parties interested are opposed to it. In the Ailesbury case (1892, A.C. 356) the tenant for life of a large estate, with a family mansion and park, had encumbered his life estate to such an extent that it was of no pecuniary value to him, and at the instance of his creditors proposed to sell the whole estate. All the persons interested in remainder opposed the sale, and Mr Justice Stirling refused to consent to the sale; but his decision was reversed in the Court of Appeal, and the decision of the latter court was affirmed in the House of Lords. The important principle was there laid down that in exercising its discretion the court might have regard to the interests of the tenants on the estate, as well as of the remainder men, and as a tenant for life in that position could not do his duty to the land, the sale was permitted to take place notwithstanding the opposition of the family. The contract was subsequently rescinded on a question of title, and shortly afterwards the tenant for life died. It may be inferred from the judgment of the Court of Appeal in Lord Radnor's case (45 Ch.D. 402), which was an application for leave to sell certain heirlooms, that the court will not overrule the discretion of the tenant for life when exercised in good faith and on reasonable ground, notwithstanding the opposition of remainder men. The tenant for life is also empowered to grant leases for ninety-nine years for building and for sixty years for mining purposes, and, with the consent of the court, for any term or in perpetuity where it is the custom in the district for land to be sold or where it is difficult otherwise to make leases or grants for these purposes (secs. 6-10), and on a grant in fee for building purposes a rent charged may be reserved (Act of 1890, sec. 9). By sec. 11 of the last-mentioned Act the tenant for life is also empowered to raise money by mortgage of the estate for the discharge of incumbrances. The Acts contain provisions for the investment and application of purchase money, or other capital money, arising from exercise of the powers of the Act and other ancillary provisions, and a very wide definition of the persons included under the expression "tenant for life." It may be added that the powers of the tenant for life

cannot be assigned and will not pass by an assignment of the life estate, but cannot be exercised without the consent of the assignee, and that a contract by a tenant for life not to exercise his power is void (Act of 1882, sec. 50 (1) (2)).

The Settled Land Act was unquestionably a bold and well-conceived piece of legislation. It has proved extremely beneficial in ridding land of encumbered owners and making it marketable. It has also benefited owners of settled property, the income of which, when invested in land, is insufficient to support their social position or family obligations. And, on the other hand, an owner who prefers to retain his family estate is enabled, either by selling outlying parts or by mortgage, to raise money for its development and permanent improvement.

The history of the registration² either of assurances or of titles to land in England is one of half-hearted legislation and consequent failure. The subject was agitated in the Long Parliament, but it was not until the reign of Queen Anne that the experiment was made. Registries of deeds and wills were established for the county of Middlesex by 7 Anne c. 20, for the West Riding of Yorkshire by 2 and 3 Anne c. 4, and for the East Riding and Kingston-upon-Hull by 6 Anne c. 62; and by 8 Geo. II. c. 6 similar provisions were applied to the North Riding. Presumably these Acts were intended as an experiment, with a view to the ultimate extension of a similar system to other parts of England. The policy of the Acts was to give priority to registered assurances over unregistered ones, and thereby secure publicity and safety to transactions in land. This object, however, was defeated by the lawyers in the Court of Chancery. It was there held by Lord Hardwicke that the equitable doctrine as to the effect of notice was not excluded by the Acts, and consequently a settlement prior in date, but unregistered, was allowed priority over a subsequent registered settlement made with notice of the first one (*Le Neve v. Le Neve*, Amb. 436). Sir William Grant in following this decision said, "It has been much doubted whether the courts ought ever to have suffered the question of notice to be agitated against a party who has registered his assurance" (*Wyatt v. Barwell*, 19 Ves. 435). On the other hand it was held that registration is not notice, so that a prior registered owner for an equitable interest was postponed to a subsequent purchaser with the legal estate and with no notice (except by the registration) of the prior interest. This was decided by Lord Camden on the authority of an earlier unreported case. In his judgment Lord Camden said, "If it were a new case I should have my doubts, but the point is closed by the earlier case," and expressed his opinion that the previous decision had led to great laxity in searching the registers (*Morecock v. Dickins*, Amb. 678). The experiment was not extended to other parts of England. The chief result of the statutes of Anne was to confer valuable pieces of patronage on the Lord Chancellor, and to increase the cost of conveyancing in the two counties and occasionally furnish materials for litigation.

**Registration of
titles to
land.**

So things remained until the year 1862, when Lord Westbury carried an Act (25 and 26 Vict. c. 53) for the registration of titles to land. This, it will be observed, was a new departure. The difference between a system of registration of assurances and one of registration of titles is vital. In the former case the conveyance creates the title, and the registration is only for the purpose of preserving a record of it and giving it publicity. In a system of registration

¹ 48 and 49 Vict. c. 72, 52 and 53 Vict. c. 36, 53 and 54 Vict. c. 69.

² See REGISTRATION (LAND), *Encyclopædia Britannica*, vol. xx. p. 342, and LAND REGISTRATION in the present volume.

of titles, on the other hand, the entry of the person's name on the register constitutes his title. The previous deed is but the authority to the registrar to enter the name of the grantee in the place of the grantor, and the subsequent certificate is evidence only of the entry. Registration under Lord Westbury's Act was optional, and the Act required an official investigation and judicial declaration of title before registration. The Act was useful to persons who desired to sell their land in small lots without the expense to the purchasers of investigation of title, but was not likely to be generally adopted. Few titles could pass the ordeal of an official examination, and no prudent person would run the risk of his title being rejected or "blown upon." As it would be necessary to have the title examined by the applicant's own conveyancer before being submitted to the office, the expense of registration under this Act was also excessive.

In 1875 Lord Cairns's Land Transfer Act (38 and 39 Vict. c. 87) was passed. Like its predecessor, this Act was optional only. But it introduced the principle of registration without previous investigation. The scheme of the Act was to enable (1) a purchaser of an estate in fee simple, (2) any person entitled in law or equity to a like estate, (3) any person entitled to dispose for his own benefit of a like estate, and in each case, whether subject to incumbrances or not, to be registered, either with an absolute or qualified title, after an official investigation of the title, or with "a possessory title," without such investigation. A "possessory title" gives no better right to the holder of it than he had before, but forms a root of a new title which, if the land remains on the register, will by lapse of time mature into an absolute registered title. The result is that a vendor with a registered "possessory title" can only be required to give a purchaser an abstract of his title antecedent to registration for such a period as, together with the period subsequent to registration, would make up forty years. But in practice a purchaser would probably be satisfied with a much shorter period. One objection to Lord Westbury's Act was thus removed, and in the opinion of the writer this is undoubtedly the sound principle on which legislation should proceed, though some impatient reformers clamour for more drastic treatment. It will be observed that the Act of 1875 does not provide for the registration of land in settlement, except where the legal estate is vested in trustees.

Prior to 31st December 1898, when the Registry Act came into force, 411 titles had been registered under Lord Westbury's Act, and 187 absolute or qualified titles, and only 144 possessory titles under Lord Cairns's Act. What is the reason for the failure of landowners to make greater use of these Acts? It must sorrowfully be admitted that the solicitors (speaking generally) assumed an attitude of hostility or indifference to the new system, and did not advise their clients to register their titles. It would be unfair to a profession of high-minded men to attribute this entirely to motives of self-interest. It arose partly from a natural conservatism, and partly from a professional fear of leaving a system of conveyancing in which they were brought up, and which they understood, for an untravelled country, the charms of which they inadequately understood and were slow to appreciate. It is not wonderful that eminent members of that branch of the profession have persuaded themselves and publicly maintained that the disadvantages of a system of registration of title exceed its advantages. But it is strange that the bankers have not been advocates of the new system. They seem to regard the facility of lending money to their customers on deposit of deeds without the publicity of registration as essential to their

business, though it does not exist in Scotland, or at the present time in Yorkshire. And they forget that they have been the principal sufferers from the frauds which have arisen out of this very facility, and which would have been impossible with an efficient system of registration either of title-deeds or of titles.

In the year 1884 the Yorkshire Registries Act (47 and 48 Vict. c. 54) was passed for the purpose of consolidating and amending the law relating to the registration of deeds and other matters affecting lands within the three Ridings. The Act provides for the registration of assurances and wills (sec. 4), memoranda of lien or charge (sec. 7), and intestacies (sec. 12). It is provided (sec. 7) that no lien or charge shall have any effect or priority against a registered assurance for valuable consideration unless and until a memorandum thereof has been registered; and (sec. 14) that all assurances shall have priority according to the date of registration, and every registered will shall have priority according to the date of the testator's death if registered within six months thereafter, or according to the date of registration if not made within that period; and further, that all priorities given by the Act shall have full effect in all courts except in cases of actual fraud, and no person claiming legal or equitable interests under any registered instrument shall lose his priority merely in consequence of having been effected with actual or constructive notice, except in cases of actual fraud. By sec. 15 registration of any instrument has the effect of notice of such registration, and of the fact of registration to all persons and for all purposes whatsoever, as from the date of registration. There are other ancillary and necessary provisions. It will thus be seen that the main defects of the Acts of Anne have been remedied so far as the Yorkshire registries are concerned, with the singular result that one county enjoys a system of land tenure differing in material respects from those prevailing in other English counties.

In the successive years 1893, 1894, and 1895, Bills were brought in by Lord Herschell for the compulsory registration of titles to land. The general scheme and main features of all these Bills are the same as those of the Torrens system adopted in Australia, and as those of the system in use in Germany and Austria-Hungary, but they are drafted on the lines of amending and supplementing the Act of 1875. At length, in 1897, the Land Transfer Act (60 and 61 Vict. c. 65) was passed on a Bill brought in by Lord Halsbury. This Bill was, in fact, the Bill of 1895, with some special provisions to meet objections which had been urged by opponents before the Select Committee of the House of Commons on the earlier Bill. Part I. provides for the real estate of a deceased person becoming vested in his personal representative from time to time as if it were a chattel real. This is an excellent provision, and is essential for any efficient system of registration. Part II. contains amendments of the Act of 1875. Amongst other things provision is made for the registration of settled land at the option of the tenant for life either in his name or in the names of trustees, with a power of sale (if any), or in the names of persons having an over-riding power of appointment of the fee simple (sec. 6), with a special provision as to land held by incumbents of a benefice (sec. 15); and a power is given to remove land from the register (sec. 17), which meets one objection which has been made. Part III. provides for compulsory registration and an insurance fund. The Crown is empowered by Order in Council, as respects any county or part of a county, to declare that after a named day registration of title (under the Act of 1875) shall be compulsory on sale (not, it will be observed, on any devolution of title by death), subject to a veto of the county council. Such an Order in Council has been made as regards the county of

London, and registration is therefore now compulsory in that county. But registration cannot be made compulsory in any other county except upon a resolution of the county council, passed at a meeting at which two-thirds of the whole number of the members shall be present. It remains to be seen whether the success of the experiment in London will induce other counties to adopt the Act, or whether the Act will share the neglect of previous Acts.

In the meantime the old system of conveyancing will continue. Abstracts of title will still be delivered and investigated afresh on every transaction. Bankers and others will still lend money on deposits of deeds, and find themselves postponed to an earlier equitable title of which they had no notice, or to a subsequent purchaser who has acquired the legal estate without notice of their incumbrance. And it will still be possible for ingenious persons to defraud creditors and purchasers by manufacturing a duplicate set of deeds. Much has no doubt been done by the Conveyancing Acts to restrain the exuberance of legal language in conveyances and other instruments, and perhaps still more has been done by the Solicitors' Remuneration Act, 1881 (44 and 45 Vict. c. 44), which permits *ad valorem* charges for conveyancing business. Under this Act a scale of costs for conveyancing business has been established by General Order, 1882. This scale was prepared and agreed upon by the solicitors themselves, but, from the number of decisions on the construction of it, its language does not appear to be free from ambiguity.

A favourite fiction of the common law that husband and wife make one person, and that person, it may be added, the husband, was rudely shaken by the Married Women's Property Act, 1882 (45 and 46 Vict. c. 75), repealing an earlier Act of 1870. Under this Act a married woman may possess and enjoy her own, whether acquired before or after marriage, and may contract with the consequent ability to sue and liability to be sued in respect of her separate property. Mention may also be made of the Guardianship of Infants Act, 1886 (49 and 50 Vict. c. 27), which for the first time recognizes the right of a widow to be guardian of her own child. The Bill for this Act, as introduced into the House of Commons, contained a declaration of the equal rights of the spouses in their children during marriage. But this conception of marriage as a partnership between equal partners enjoying equal rights secured by community of interests was thought to be too wide of the facts of life to form a safe basis for legislation. The consideration of the status of married women enjoying separate property has lately come before the courts, chiefly in connexion with the enforcement of judgments against them. Some ladies seem to have a rooted distrust of their solicitors and counsel alike, and an imperfect appreciation of the nature or meaning of a judgment. The quarrels between a notorious litigant and her solicitors have had the solitary advantage of helping to settle the law as to the mode of enforcing a judgment against the separate property of a married woman.

The materials with which the lawyer has to do his work are second only in importance to the rules in accordance with which his work has to be done. Reports and statutes are his stock-in-trade. England is not yet within a measurable distance of a civil or criminal code; but some progress has been made towards that end by the passing from time to time of various Acts codifying branches of law. The principal ones are the Bills of Exchange Act, 1882 (45 and 46 Vict. c. 61), the Partnership Act, 1890 (53 and 54 Vict. c. 39), the Trusts Act, 1893 (56 and 57 Vict. c. 53), and the Interpretation Act, 1889 (52 and 53 Vict. c. 63). These

Acts have been prepared with great care under the best expert advice, and experience has demonstrated their utility to the layman as well as the lawyer. A Bill for the like treatment of the law relating to marine insurance has been proposed in more than one session. A Bill for a criminal code was brought in in 1879 and dropped.

The Statute Law Revision Committee have continued their useful work of excising dead law from the statute book, partly by repeal of obsolete and spent Acts and parts of Acts, and partly by pruning redundant preambles and words. The construction of a section of an Act may depend on the preamble and the context, and the repeal of the preamble and certain parts of the Act may therefore affect the construction of what is left. This is provided for by a clause which is said to have been settled by Lord Westbury. It provides (in effect) that the repeal of any words or expressions of enactment shall not affect the construction of any statute or part of a statute. The lawyer, therefore, cannot rely on the revised edition of the statutes alone, and it is still necessary for him to consult the complete Act as it was originally enacted. Perhaps it does not very much matter.

But it is a pity, while efforts are made to get rid of dead law and improve the record of that which is kept alive, that equal care is not taken that new enactments should be made in accurate and intelligible language. The most superficial acquaintance with the current decisions in the courts will show how much of the time of the judges is taken up in coping with the obscurity of modern Acts of Parliament. This is not altogether the fault of the distinguished lawyers who have filled the place of Treasury counsel or Government draftsmen. Bills are required to be drawn so as to be passed on the lines of least resistance, and this is found in the clauses incorporating or making applicable sections of a previous Act, or providing that a previous enactment should be read as if *a* were *b* or *c* were *d*. Sometimes on referring to a previous Act you find that you are referred back to an even earlier one. Legislation by reference has its merits and a use of its own, no doubt, but lucidity is not one of the merits. Again, a minister in charge of a Bill is always desirous of getting it through within his allotted time, and sometimes too readily accepts an amendment without complete appreciation of its bearing on the particular section or the general scheme of the Bill. In the House of Lords ministers are naturally anxious to get a difficult Bill through without serious amendment which will occasion fresh opposition or debate in the Commons. More may no doubt be done in the way of revision by the authors of the Bill in the interval between the two Houses, and in the House of Lords if the Bill originates in the Commons. But the remedy in the long-run lies with the House of Commons. The costs of interpreting an obscure enactment (by means of an action with an appeal first to the Appeal Court and then to the House of Lords) fall upon the suitor, *i.e.*, upon the electorate. If members steadily set their faces against the consideration of any Bill the meaning of which cannot be discovered within its four corners, it would do some good; and if greater care were exercised in accepting amendments, and in revising those that have been accepted, still greater improvement might be hoped for.

The pressure on the time of Parliament is the excuse for the growing tendency of leaving the details of legislation to be dealt with by rules to be made by an authority named in the Act. This is no doubt necessary in some cases, as for instance in the Judicature Acts. But it is, in fact, the delegation by Parliament to other bodies, or even individuals, of legislation, often of an important character. In many cases the mode in which the enactments are to be worked out in practice may affect

**Legislation
as to
married
women.**

Drafting.

**Codifica-
tion.**

the whole question of the expediency or justice of the Act itself. Again, under the guise, and for the purpose of framing rules, the rule-making authority may and sometimes must put its own interpretation on the Act, and if (as is usually the case) the rules have the effect of a statute the interpretation thus given becomes irrevocable. In this way the function of the courts of law is usurped. It is true that by 56 and 57 Vict. c. 66, notice of the proposal to make any statutory rules (with large exceptions) is required to be published in the *London Gazette* forty days before the making thereof; and in some cases the rules are required to be laid on the tables of both Houses of Parliament before they come into operation. But every one who has sat in either House knows how slender are the means of the private member to call attention to the subject with effect, and how little real protection is secured by the presentation of the rules to Parliament.

The lawyer relies on the reporter as well as on the legislator, and here he is better served. The movement originated by Mr Daniel led to the formation of the Council of Law Reporting in the year 1863.

Law reporting. The council now consists of three *ex-officio* members—the Attorney-General, the Solicitor-General, and the President of the Incorporated Law Society, and ten members appointed by the three Inns of Court, the Incorporated Law Society, and the council itself on the nomination of the General Council of the Bar. Amongst the eminent persons who have presided over the council the most conspicuous for his services is Mr Joseph Brown, K.C., who for many years successfully devoted a large amount of his valuable time to the details of the business with a view to the improvement of the Reports and to economy in their production. The practitioner and the student now get for a subscription of four guineas a year the Reports in all the Superior Courts and the House of Lords, and the Judicial Committee of the Privy Council issued in monthly parts, a king's printer's copy of the Statutes, and Weekly Notes, containing short notes of current decisions and announcements of all new rules made under the Judicature Acts and other Acts of Parliament, and other legal information. In addition the subscriber receives the Chronological Index of the Statutes published from time to time by the Stationery Office, and last, but not least, the Digests of decided cases published by the Council from time to time. In 1892 a Digest was published containing the cases and statutes for twenty-five years, from 1865 to 1890, and this was supplemented by one for the succeeding ten years, from 1891 to 1900. The digesting is now carried on continuously by means of "Current Indexes," which are published monthly and annually, and will be consolidated into a digest at stated intervals (say) of five years. The Indian appeals series, which is not required by the general practitioner, is supplied separately at one guinea a year. Those who remember the cost of keeping up a law library before the publication of the Law Reports will appreciate the immense benefit conferred on the practitioner and on the public by the work of the Council. That the Reports are perfect no one will dare to affirm. Criticisms were freely made on the editing and reporting, and for a few years a rival set of reports with the ambitious title of *The Reports* was published. But this series died a natural death, and under the present editorship it is believed that there is less room for criticism. When the writer was chairman of the Council the complaints were for the most part that too much or too little was reported, showing how difficult is the work of the editor in drawing the line between cases laying down new principles or merely applications of old principles. Usually the critic

complained that some case in which he had a special interest was not reported. A great portion of the reports is taken up with the construction of public Acts or of statutory rules which is of comparatively ephemeral value.

But what of the Bar itself? It was widely felt amongst members of the Bar that it was not adequately represented by the Inns of Court with their self-elected **The Bar.** bodies of benchers. At length a Bar council was formed, consisting of a just proportion of Queen's [King's] Counsel and outer barristers elected by all the members of the Bar. This council was subsequently reorganized under the name of the General Council of the Bar. It receives complaints and suggestions from barristers and watches over the discipline of the Bar, but its most useful public work is in criticizing proposed legal changes and publishing reports of its committees thereon. The reports of the Council of the Bar are often of great value and receive attention in the highest quarters. It has sometimes seemed to the writer that to advocate a high standard of legal training for admission to the Bar is presumptuous in one who was called at a time when neither legal education nor examination was required, and who is stopped from saying that a fair measure of success may not be attained both at the Bar and on the Bench without either one or the other. But, nevertheless, the writer believes such a training is essential to the wellbeing or even the continued existence of the Bar. England is no doubt the paradise of amateurs, but, after all, the need of a distinct professional training is gradually being recognized in every profession and calling. A commission which was appointed in 1854 recommended by their report the formation of the Inns of Court into a Legal University, with power to confer degrees in law. In 1875 Lord Selborne brought in a Bill for this purpose, but failed to pass it through Parliament. The writer regrets that the Inns of Court did not avail themselves of the opportunity of carrying out this recommendation in substance by accepting the invitation of the London University Commissioners to become the Law Faculty of that university. However, the benchers have for some time past recognized the call for some legal education in candidates for the Bar. They have appointed a committee of their own members, called the Council of Legal Education, under whose auspices lecturers are appointed in the various branches of law, and their lectures have been opened to the general public as well as to the students of the Inns. Candidates since 1872 have been required to pass an examination before being called to the Bar. It has been suggested that a law degree of some English or (under conditions) foreign university might be accepted as a test of general legal knowledge, and that the tests imposed by the Inns of Court might in that case be confined to such practical or purely professional training as may be thought necessary. For admission as a solicitor, a candidate has long been required by the Incorporated Law Society to pass two examinations, but this body has ceased to provide lectures for students.

We have thus seen that within the last thirty years of the Victorian reign the Superior Courts were entirely reorganized on a new model and their procedure cleared of technicality and reduced to the simplest forms, the law relating to bankruptcy, patents, and joint-stock companies reformed, prisoners admitted to give evidence on their own behalf, great innovations made in the law relating to settled estates and the transfer of land, married women entrusted with the ownership of their property and the guardianship of their children, and some progress made towards codification of the law and reduction of the Statute Book to manageable proportions. (D.)

II. UNITED STATES.

The laws of the various states and territories of the United States, and those of England, rest at bottom on the same foundation, namely, the English common law as it existed at the beginning of the 17th century. (See *Common Law*, below.) The only exceptions worth noting are to be found in the state of Louisiana, the territory of New Mexico, and the acquisitions following the Spanish war of 1898. Those derive most of their law from France or Spain, and thus remotely from the principles of Roman jurisprudence. A part also, but comparatively a small part, of the law of Texas, Missouri, Arizona, and the Pacific states comes from similar sources. The United States as a whole has no common law, except so far as its courts have followed the rules of English common-law procedure in determining their own. Most of the positive law of the United States comes from the several states. It is the right of each state to regulate at its pleasure the general relations of persons within its territory to each other, as well as all rights to property subject to its jurisdiction. Each state has also its own system of adjective law. The trial courts of the United States of original jurisdiction follow in general the practice of the state in which they sit as to procedure in cases of common-law character. As to that in equity, or what means the same thing, chancery causes, they follow in general the practice of the English Court of Chancery as it existed toward the close of the 18th century, when the original Judiciary Act of the United States was adopted. The public statutes of the United States are to be found in the *Revised Statutes* of 1873, and in the succeeding volumes of the *Statutes at Large*, enacted by each Congress. Those of each state and territory are printed annually or biennially as they are enacted by each legislature, and are commonly revised every fifteen or twenty years, the revision taking the place of all former public statutes, and being entitled *Revised Statutes*, *General Statutes*, or *Public Laws*. The private or special laws of each state, so far as such legislation is permitted by its constitution, are in some states published separately, and made the subject of similar compilations or revisions; in others they are printed with the public session laws. American courts are often given power by statute to make rules of procedure which have the force of laws. Municipal subdivisions of a state generally have authority from the legislature to make ordinances or bye-laws on certain subjects, having the character of a local law, with appropriate sanctions, commonly by fine or forfeiture.

Law in the United States has been greatly affected by the results of the Civil War. During its course (1861–1865) the powers of the President of the United States may be said to have been re-defined by the courts. It was its first civil war, and thus for the first time the exercise of the military authority of the United States within a state which had not sought its aid became frequent and necessary. Next followed the Amendments of the Constitution of the United States having for their special purpose the securing beyond question of the permanent abolition of slavery and the civil and political rights of the coloured race. At the outset the Supreme Court of the United States was inclined to treat them as having a very limited operation in other directions. One of the provisions of the XIVth Amendment is that no state shall deny to any person within its jurisdiction the equal protection of the laws. The benefit of this guarantee was claimed by the butchers of New Orleans, in contending against a monopoly in respect of the slaughter of cattle granted by the state of Louisiana to a single corporation. Their suit was dismissed by the Supreme Court in 1873,

with the expression of a doubt whether any action of a state not directed by way of discrimination against the negroes as a class, or on account of their race, would ever be held to come within the purview of the provision in question.¹ The Chief Justice and three of his associates dissented from the judgment, holding that the XIVth Amendment did protect the citizens of the United States against the deprivation of their common rights by state legislation.² Public sentiment supported the view of the minority, and it was not long before changes in the *personnel* of the court, occurring in common course, led it to the same conclusions. The protection of the XIVth Amendment is now invoked before it more frequently than is that afforded by any other article of the Constitution. In one of its recent terms twenty-one cases of this nature were decided.³ Very few of them related to the negro. Since the decision in the Slaughter-house cases, the controversies as to the constitutional rights of the negro have been comparatively infrequent, but there has been a great and steadily increasing number in all the courts in the country, involving questions of discrimination in favour of or against particular individuals, or of changes affecting the rights of parties in the accustomed forms of judicial procedure.

Down to 1868, when this Amendment was adopted, it was, as to most matters, for the state alone to settle the civil rights and immunities of those subject to its jurisdiction. If they were to be free from arbitrary arrests, secure in liberty and property, equal in privilege, and entitled to an impartial administration, it was because the constitution of the state so declared. Now they have the guarantee of the United States that the state shall never recede from these obligations. This has readjusted and reset the whole system of the American law of personal rights.⁴

The Supreme Court of the United States has used the great power thus confided to it with moderation. Its general rules of decision are well stated in these words of Mr Justice Brown, found in one of its recent opinions:—

In passing upon the validity of legislation, attacked as contrary to the XIVth Amendment, it has not failed to recognize the fact that the law is, to a certain extent, a progressive science; that in some of the states methods of procedure, which at the time the constitution was adopted were deemed essential to the protection and safety of the people or to the liberty of the citizen, have been found to be no longer necessary; that restrictions which had formerly been laid upon the conduct of individuals, or of classes of individuals, had proved detrimental to their interests; while, upon the other hand, certain other classes of persons, particularly those engaged in dangerous or unhealthful employments, have been found to be in need of additional protection. Even before the adoption of the constitution, much had been done toward mitigating the severity of the common law, particularly in the administration of its criminal branch. The number of capital crimes, in this country at least, had been largely decreased. Trial by ordeal and by battle had never existed here, and had fallen into disuse in England. The earlier practice of the common law, which denied the benefit of witnesses to a person accused of felony, had been abolished by statute, though, so far as it deprived him of the assistance of counsel and compulsory process for the attendance of his witnesses, it had not been changed in England. But, to the credit of her American colonies, let it be said that so oppressive a doctrine had never obtained a foothold there. The 19th century originated legal reforms of no less importance. The whole fabric of special pleading, once thought to be necessary to the elimination of the real issue between the parties, has crumbled to pieces. The ancient tenures of real estate have been largely swept away, and land is now transferred almost as easily and cheaply as personal property. Married women have been emancipated from the control of their husbands, and placed upon a practical equality with them with respect to the acquisition, possession, and transmission of property. Imprisonment for debt has been abolished.

³ *Guthrie on the Fourteenth Amendment*, 27.

⁴ Baldwin's *Modern Political Institutions*, 111, 112.

Exemptions from execution have been largely added to, and in most of the states homesteads are rendered incapable of seizure and sale upon forced process. Witnesses are no longer incompetent by reason of interest, even though they be parties to the litigation. Indictments have been simplified, and an indictment for the most serious of crimes is now the simplest of all. In several of the states grand juries, formerly the only safeguard against a malicious prosecution, have been largely abolished, and in others the rule of unanimity, so far as applied to civil cases, has given way to verdicts rendered by a three-fourths majority. This case does not call for an expression of opinion as to the wisdom of these changes, or their validity under the XIVth Amendment, although the substitution of prosecution by information in lieu of indictment was recognized as valid in *Hurtado v. California*, 110 U.S. 516. They are mentioned only for the purpose of calling attention to the probability that other changes of no less importance may be made in the future, and that while the cardinal principles of justice are immutable, the methods by which justice is administered are subject to constant fluctuation, and that the Constitution of the United States, which is necessarily and to a large extent inflexible and exceedingly difficult of amendment, should not be so construed as to deprive the states of the power to amend their laws so as to make them conform to the wishes of the citizens as they may deem best for the public welfare without bringing them into conflict with the supreme law of the land. Of course, it is impossible to forecast the character or extent of these changes, but in view of the fact that from the day Magna Charta was signed to the present moment, amendments to the structure of the law have been made with increasing frequency, it is impossible to suppose that they will not continue, and the law be forced to adapt itself to new conditions of society, and particularly to the new relations between employers and employes, as they arise.¹

The Civil War deeply affected also the course of judicial decision in the Southern states. During its progress it engaged the attention of a very large part of the population, and the business of the courts necessarily was greatly lessened. Upon its close political power passed, for a time, into new hands, and many from the Northern and Western states took prominent positions both at the bar and on the bench. The very basis of society was changed by the abolition of slavery. New state constitutions were adopted, inspired or dictated by the ideas of the North. The transport system was greatly extended, and commerce by land took to a large extent the place formerly filled by commerce by navigation. Manufacturing came in to supplement agricultural industry. Cities grew and assumed a new importance. Northern capital sought investment in every state. It was a natural consequence of all these things that the jurisprudence of the South should come to lose whatever had been its distinctive character. The unification of the nation inevitably tended to unify its law.

An important contribution towards this result was made by the organization of the American Bar Association in 1878. Of the fourteen signers of the call for the preliminary conference, five were from the Southern states. Its declared objects were "to advance the science of jurisprudence, promote the administration of justice and uniformity of legislation throughout the Union, uphold the honour of the profession of the law, and encourage cordial intercourse among the members of the American Bar." Each meeting is opened by an address from the president, in which he is to "communicate the most noteworthy changes in statute law on points of general interest made in the several states and by Congress during the preceding year." It has discussed and published papers upon such subjects as "American institutions and laws"; "the civil law and codification"; "avoidable causes of delay and uncertainty in our courts"; "the relationship of law and national spirit"; "the distinction between legislation and judicial functions"; "the opportunity for development of jurisprudence in the United States"; "law

reports and law reporting"; "jurisprudence considered as a branch of the social science"; "judicial independence"; "the necessity for uniformity in the laws governing commercial paper"; and "the development of the law of contracts." The reports of its committees, and the action which it has taken from time to time, have had a wide influence, not only in shaping legislation, but in directing the course of legal opinion and legal education.

Largely through its efforts, the American law schools have taken on a new character. The course of study has been both broadened and prolonged, and the attendance of students has increased in full proportion to the additions to the facilities for obtaining a more thorough training in the profession. In 1898-99 there were nearly 12,000 matriculations in these institutions, which is more than double the number at the close of the preceding decade. When the association commenced its labours, those studying law in the offices of practising lawyers very largely outnumbered those found in the law school. The proportion is now reversed. During the year 1900, for instance, the State Board of Law Examiners in New York examined 899 applicants for admission to the bar of that state. Of these all but 157 had received their legal education wholly or in part at a law school.² In 1878 few law schools had adopted any system of examination for those desiring to enter them. Such a requirement for admission is now common. In only one school were opportunities then afforded for advanced studies by graduate students with a view to attaining the doctorate in law. Courses of this description are now offered by several of the university schools.

A more scientific character has thus been taken on by American law. It is noticeable both in legal text-books and in the opinions of the courts of last resort. In the latter precision of statement and method in discussion are invited by the uniform practice of preparing written opinions. The original practice of reading these from the bench has been generally discontinued. They are simply handed down to an official reporter for publication, which is done at the expense of the Government by which the court is commissioned. With the judicial reports of each state the lawyers of that state are required to be familiar; and this is rendered possible, even in the larger ones, by state digests, prepared every few years by private enterprise. Outside of the state their circulation is comparatively limited, though sets of all are generally found in each state library, and of many in the Bar libraries at the principal county seats. The private libraries of lawyers in large practice also often contain the reports of adjoining and sometimes those of distant states, as well as those of their own and of the Supreme Court of the United States. The decisions of one state, however, are now best known in others through unofficial reports. One large publishing concern prints every case decided in the courts of last resort. They are published in several distinct series, those, for instance, coming from the Northern Atlantic states being grouped together as the *Atlantic Reporter*, and those from the states on the Pacific coast as the *Pacific Reporter*. Another house has published a compilation professing to give all the leading American cases from the first to the latest volume of reports. Another makes a similar selection from the decisions of each year as they appear, and publishes them with critical annotations. There are also annual digests of a national character, comprehending substantially all American cases and the leading English cases reported during the preceding year.

¹ *Holden v. Hardy*, 169 United States Reports, 336, 385-87.

² *Columbia Law Review*, i, 99.

These various publications are widely diffused, and so the American lawyer is enabled, in preparing for the argument of any cause involving questions of difficulty, to inform himself with ease of such precedents as may apply. A court in Texas is thus as likely to be made acquainted with a decision in Maine or Oregon as with one in any nearer state, and in the development of American law all American courts are brought in close touch with each other.

This tendency has been advanced by the steady growth of codification. (See *Code*.) That is beginning also to serve to bring English and American law nearer together in certain directions. A Negotiable Instruments Act, promoted by the American Bar Association, and prepared by a conference of commissioners appointed by the several states to concert measures of uniform legislation, has been adopted in the leading commercial states. It is founded upon the English "Chalmers's Act," and the English decisions giving a construction to that have become of special importance. The Acts of Parliament known as the Employers' Liability Act and the Railway and Canal Traffic Act have also served as the foundation of similar legislation in the United States, and with the same result. Modern English decisions are, however, cited less frequently in American courts than the older ones; and the older ones themselves are cited far less frequently than they once were. In the development of their legislation, England and the United States have been in general harmony so far as matters of large commercial importance are concerned, but as to many others they have since 1850 drawn apart. Statutes, at one point or another, probably now affect the disposition of most litigated causes in both countries. Their application, therefore, must serve more or less to obscure or displace general principles, which might otherwise control the decision and make it a source of authority in foreign tribunals. The movement of the judicial mind in the United States, and also its modes and form of expression, have a different measure from that which characterizes what comes from the English bench. American judges are so numerous, and (except as to the Supreme Court of the United States) the extent of their territorial jurisdiction so limited, that they can give more time to the careful investigation of points of difficulty, and also to the methodical statement of their conclusions. Whatever they decide upon appeal being announced in writing, and destined to form part of the permanent published records of the state, they are expected and endeavour to study their words and frame opinions not only sound in law but unobjectionable as literary compositions.

The choice of American judges, particularly in the older states, has been not uninfluenced by these considerations. Marshall, Bushrod Washington, Story, Kent, Ware, Bradley, and many of their contemporaries and successors, were put upon the bench in part because of their legal scholarship and their power of felicitous expression. Hence the better American opinions have more elaboration and finish than many which come from the English courts, and are more readily accepted as authorities by American judges. But the great multiplication of reports has so widened the field of citation, as in effect to reduce it. Each of the larger and older states has now a settled body of legal precedent of its own, beyond which its judges in most cases do not look. If a prior decision applies, it is controlling. If there be none, they prefer to decide the case, if possible, on principle rather than authority.

While the state courts are bound to accept the construction placed upon the Constitution and laws of the United States by the Supreme Court of the United States,

and thus uniformity of decision is secured in that regard, the courts of the United States, on the other hand, are as a rule obliged to accept in all other particulars the construction placed by the courts of each state on its constitution and laws. This often gives a seeming incongruity to the decisions of the Supreme Court of the United States. A point in a case coming up from one judicial circuit may be determined in a way wholly different from that followed in a previous judgment in a cause turning upon the same point, but appealed from another circuit, because of a departure from the common law in one state which has not been made in another. In view of this, a doctrine originally proposed by Mr Justice Story in 1842¹ has not been infrequently invoked of late years, which rests upon the assumed existence of a distinctive federal jurisprudence of paramount authority as to certain matters of general concern, as for example those intimately affecting commerce between the states or with foreign nations. The consequence is that a case involving such questions may be differently adjudged, according as it is brought in a state or in a federal court.²

The divergences now most noticeable between English and American law are in respect of public control over personal liberty and private property, criminal procedure, and the scope of the powers of municipal corporations.

Under the constitutional provision that no one shall be deprived of life, liberty, or property without due process of law, American courts frequently declare void statutes which in England would be within the acknowledged powers of Parliament. These provisions are liberally expounded in favour of the individual, and liberty is held to include liberty of contract as well as of person. Criminal procedure is hedged about with more refinements and safeguards to the accused than are found in England, and on the other hand, prosecutions are more certain to follow the offence, because they are universally brought by a public officer at public expense. The artificiality of the proceedings is fostered by a general right of appeal on points of law to the court of last resort. It is in criminal causes involving questions of common-law liability and procedure³ that English law-books and reports are now most frequently cited. American municipal corporations are confined within much narrower limits than those of England, and their powers more strictly construed.

Trial by jury in civil causes seems to be declining in public esteem. The expenses necessarily incident to it are naturally increasing, and the delays are greater also from a general tendency, especially in cities, where most judicial business is transacted, to reduce the number of hours a day during which the court is in session. The requirement of unanimity is dispensed with in a few states, and it has been thus left without what many deem one of its essential features. The judge interposes his authority to direct and expedite the progress of the trial less frequently and less peremptorily than in England. A jury is waived more often than formerly, and there is a

Trial by jury.

² See *Forepaugh v. Delaware, Lackawanna, and Western Railroad Company*, 128 Pennsylvania State Reports, 267; *Faulkner v. Hart*, 82 New York Reports, 313; and *Lake Shore and Michigan Southern Railway Company v. Prentice*, 147 United States Reports, 101.

³ See as examples, *Commonwealth v. Rubin*, 165 Massachusetts Reports, 453, in which Holmes, C.J., traces the rule that, if a man abuse an authority given him by the law, he becomes a trespasser *ab initio*, back to the Year Books; and *Commonwealth v. Cleary*, 172 Massachusetts Reports, 175, in which the same judge refers to *Glanville and Fleta* as authority for the proposition that the admission in evidence, in cases of rape, of complaints made by the woman soon after the commission of the offence is a perverted survival of the old rule that she could not bring an appeal unless she had made prompt hue and cry.

growing conviction that, with a capable and independent judiciary, justice can be looked for more confidently from one man than from thirteen.

The United States entered on the work of simplifying the forms of pleading earlier than England, but has not carried it so far. Demurrers have not been abandoned, and in some states little has been done except to replace one system of formality by another hardly less rigid. The general plan has been to codify the laws of pleading by statute. In a few states they have proceeded more nearly in accordance with the principles of the English Judicature Act, and left details to be worked out by the judges, through rules of court.¹

Most of the state constitutions assume that the powers of government can be divided into three distinct departments, executive, legislative, and judicial; and direct such a distribution. In thus ignoring the administrative functions of the state, they have left a difficult question for the courts, upon which the legislature often seeks in part to cast them. The general tendency has been to construe, in such circumstances, the judicial power broadly, and hold that it may thus be extended over much which is rather to be called quasi-judicial.² A distinction is taken between entrusting jurisdiction of this character to the courts, and imposing it upon them. Where the statute can be construed as simply permissive, the authority may be exercised as a matter of grace, when it would be peremptorily declined, were the meaning of the legislature that it must be accepted.³ The courts, for similar reasons, have generally declined (in the absence of any constitutional requirement to that effect) to advise the legislature, at its request, whether a proposed statute, if enacted, would be valid. While its validity, were it to be enacted, might become the subject of a judicial decision, it is thought for that reason, if for no other, to be improper to prejudge the point, without a hearing of parties interested. The constitutions of several states provide for such a proceeding, and in these the Supreme Court is not infrequently called upon in this way, and gives responses which are always considered decisive of legislative action, but would not be treated as conclusive in any subsequent litigation that might arise.

The general trend of opinion in the Supreme Court of the United States since 1870, upon questions other than those arising under the XIVth Amendment, has been towards recognizing the police power of the several states as entitled to a broad scope. Even, for instance, in such a matter as the regulation of commerce between different states, it has been upheld as justifying a prohibition against running any goods trains on a Sunday, and a requirement that all railway cars must be heated by steam.⁴ In the "Granger Cases,"⁵ the right of the state to fix the rate of charges for the use of a grain elevator for railway purposes, and for general railway services of transportation, was supported, and although the second of these was afterwards overruled,⁶ the principle upon which it was originally rested was not shaken.

On the other hand, reasons of practical convenience

have necessarily favoured the substantial obliteration of state lines as to the enforcement of statutory private rights. Massachusetts in 1840, six years before the passage of Lord Campbell's Act, provided a remedy by indictment for the negligent killing of a man by a railway company, a pecuniary penalty being fixed which the state was to collect for the benefit of his family. In most of the other states by later statutes a similar result has been reached through a civil action brought by the executor or administrator as an agent of the law. In some, however, the state must be the plaintiff; in others the widow, if any there be. The accident resulting in death often occurs in a state where the man who was killed does not reside, or in which the railway company does not have its principal seat. It may therefore be desirable to sue in one state for an injury in another. Notwithstanding such an action is unknown to the common law, and rests solely on a local statute, the American courts uniformly hold that, when civil in form, it can be brought under such statutes in any state the public policy of which is not clearly opposed to such a remedy. In like manner the responsibilities of stockholders and directors of a moneyed corporation, under the laws of the state from which the charter is derived, are enforced in any other states in which they may be found. Thus a double liability of stockholders to creditors, in case of the insolvency of the company, or a full liability to creditors of directors who have made false reports or certificates regarding its financial condition, is treated as of a contractual nature, and not penal in the international sense of that term.⁷ As a judgment of one state has equal force in another, so far as the principle of *res adjudicata* is concerned, the orders of a court in a state to which a corporation owes its charter, made in proceedings for winding it up, may be enforced to a large extent in any other. The shareholders are regarded as parties by representation to the winding-up proceedings, and so bound by decrees which are incidental to it.⁸

Appendix.

The following series of sub-titles, alphabetically arranged, deals with points in American law not treated elsewhere in this work, generally showing a divergence from English law or practice.

Adoption.—Adoption of minors is permitted by statute in many of the states. These statutes generally require some public notice to be given of the intention to adopt, and an order of approval after a hearing before some public authority. The consequence commonly is that the person adopted becomes, in the eye of the law, the child of the person adopting, for all purposes. Such an adoption, if consummated according to the law of the domicile, is equally effectual in any other state into which the parties may remove. The legitimate status thus newly acquired is ubiquitous. (See Whitmore, *Laws of Adoption*; Ross v. Ross, 129 Massachusetts Reports, 243.)

Adultery.—This is everywhere ground of divorce, and there is commonly no prohibition against marrying the paramour or other re-marriage by the guilty party. Even

¹ This has been carried farthest in Connecticut. See *Botsford v. Wallace*, 72 Connecticut Reports, 195.

² *Norwalk Street Railway Company's Appeal*, 69 Connecticut Reports, 576; 38 *Atlantic Reporter*, 708.

³ *Zanesville v. Zanesville Telephone Company*, 63 Ohio State Reports, 442; 59 *North-Eastern Reporter*, 109.

⁴ *New York Railroad v. New York*, 165 United States Reports, 628.

⁵ *Munn v. Illinois*, 94 United States Reports, 113; *Chicago Railroad Company v. Iowa*, *ibid.* 155.

⁷ *Huntington v. Attrill*, 146 United States Reports, 657.

⁸ *Great Western Telegraph Company v. Purdy*, 162 United States Reports, 329; *Fish v. Smith*, 73 Connecticut Reports, 377; 47 *Atlantic Reporter*, 710.

Police power of states.

if there be such a prohibition, it would be unavailing out of the state in which the divorce was granted; marriage being a contract which, if valid where executed, is generally treated as valid everywhere. Adultery gives a cause of action for damages to the wronged husband. It is in some states a criminal offence on the part of each party to the act, for which imprisonment in the penitentiary or state prison for a term of years may be awarded.

Allegiance.—The English doctrine (prior to the Naturalization Act of 1870) that no man can cast off his native allegiance without the consent of his sovereign, was early abandoned in the United States, and in 1868 Congress declared that “the right of expatriation is a natural and inherent right of all people, indispensable to the enjoyment of the rights of life, liberty, and the pursuit of happiness,” and one of “the fundamental principles of the republic.” (*United States Revised Statutes*, sec. 1999.) Every citizen of a state owes a double allegiance, one to it and one to the United States. He may be guilty of treason against one or both. If the demands of these two sovereigns upon his duty of allegiance come into conflict, those of the United States have the paramount authority.

Appeal.—This term may mean (1) a removal of a cause to a higher court for a new trial on all the questions involved, or (2) taking up points of law only by proceedings in error, for revision by a higher court. Decrees in admiralty and equity in the courts of the United States are the subjects of an appeal; judgments in actions at law, of a writ of error. On an equity appeal the evidence taken at the original hearing is reported at length to the appellate court, and it has the right to review the conclusions of fact reached by the court below and come to different ones. This, however, is seldom done, the appeal being almost always decided on points of law based upon the conclusions of fact reached in the original hearing. In admiralty appeals the conclusions of fact reached by the trial court are specially set forth, and are final.

“Appeal” in many of the states is the general term for reviewing any judgment of an inferior court on assignments of error. It is also often used to signify a mode of reviewing proceedings of municipal bodies, affecting the interests of particular persons, *e.g.*, in matters of licences or assessments.

In criminal prosecutions an appeal, or writ of error on points of law, is almost everywhere allowed to the defendant, and often to the state. This is a matter of statute regulation. (*United States v. Sanges*, 144 United States Reports, 310; *State v. Lee*, 65 Connecticut Reports, 265.)

Appraiser.—This is a term often used to describe a person specially appointed by a judicial or quasi-judicial authority to put a valuation on property, *e.g.*, on the items of an inventory of the estate of a deceased person, or on land taken for public purposes by the right of eminent domain. Appraisers of imported goods and boards of general appraisers have extensive functions in administering the customs laws of the United States.

Arbitration.—Arbitration is ordinarily conducted out of court, but in most states an agreement to settle a controversy in this way may be filed in a court and enforced by its authority. There are also statutes of the United States providing facilities for adjusting disputes between certain classes of employers and workmen in this way. The United States law allows arbitration proceedings between corporations engaged in commerce between the states and their employes to take place before official arbitrators and at the public expense. (30 United States Statutes at Large, 424.)

The United States ratified in 1900 the convention

agreed on at The Hague in 1899 with reference to international arbitration. (For a discussion of the mode of proceeding before the court which has been organized under its provisions, and of the initiative belonging to the President of the United States, see an article on “The Entry of the United States into World Politics as one of the Great Powers,” in the *Yale Review* for February 1901.)

Attachment.—Attachment of debts is a statutory remedy accorded in most of the states in certain circumstances for the security of creditors, by the seizure by the sheriff of the debtor’s goods or the imposition of a lien upon his land, before judgment, and sometimes at the very commencement of the action. In some states it is only allowed in special cases, as when the debtor has absconded, or is a non-resident, or guilty of fraud; in a few it may be had, as of right, at the commencement of ordinary actions. The common-law courts of the United States (by Act of Congress) follow the practice in this regard of the state in which they sit. Such attachments (on mesne process) can generally be dissolved by the substitution of a bond with surety. The body can also be attached in most states on civil actions of tort (for a wrongful or negligent act to the damage of another), but not in actions on contract.

Attainder.—Bills of attainder are expressly forbidden by the constitution of the United States, both as respects them and the several states. This prohibition is understood not to be confined to attainders of death, but to extend to any law inflicting a punishment for a criminal offence, without a previous opportunity for a hearing and defence.

Attorney-at-Law.—Formerly, in some states, there existed a grade among lawyers of attorneys-at-law, which was inferior to that of counsellors-at-law, and in colonial times New Jersey established a higher rank still—that of serjeant-at-law. Now the term attorney-at-law is precisely equivalent to that of lawyer. Attorneys are admitted by some court to which the legislature confides the power, and on examination prescribed by the court, or by a board of state examiners, as the case may be. The term of study required is generally two or three years, but in some states less. In one no examination is required. College graduates are often admitted to examination after a shorter term of study than that required from those not so educated. In the courts of the United States admission is regulated by rules of court and based upon a previous admission to the state bar. The American attorney exercises all the functions distributed in England between barristers, attorneys, and solicitors. When acting in a court of admiralty he is styled “proctor” or “advocate.” (See *Bar*.)

Attorney-General.—The United States has an officer of this name, who has a seat in the Cabinet. Every state but one or two has a similar officer. He represents the state in important legal matters, and is often required to assist the local prosecutor in trials for capital offences. He appears for the public interest in suits affecting public charities. He is generally elected by the people for the same term as the Governor, and on the same ticket.

Bar.—Each state has its own bar, consisting of all attorneys-at-law (*q.v.*) residing within it who have been admitted to practice in its courts. As a general thing, attorneys are admitted in one court to practice in all courts. Each of the United States courts has a bar of its own. An attorney of a state cannot practise in a court of the United States unless he has been admitted to it, or to one of the same class in another district or circuit. He cannot appear in the Supreme Court of the United States

unless specially admitted and sworn as an attorney of that court, which is done on motion in case of any one who has practised for three years in the highest courts of his state and is in good standing at its bar. In most of the states there is a state Bar Association, and in some cities and counties local Bar Associations. These consist of such members of its bar as desire thus to associate, the object being to guard and advance the standards of the profession. Some own valuable libraries. These associations have no official recognition, but their influence is considerable in recommending and shaping legislation respecting the judicial establishment and procedure. They also serve a useful purpose in instituting or promoting proceedings to discipline or expel unworthy attorneys from the bar. There is an American Bar Association, founded in 1877, composed of members of the bars of different states of like character and position. Some of these associations publish annually a volume of transactions.

Betting.—Many of the states make this a penal offence when the bet is upon a horse-race, or an election, or a game of hazard. Betting contracts and securities given upon a bet are often made void, and this may destroy a gaming note in the hands of an innocent purchaser for value. The United States has no statutes on this subject. It lies outside of its field.

Carrier.—A railway company receiving goods destined for transportation by rail to a point beyond its line is generally held liable only for their transportation to the end of its line and delivery there to the connecting line, unless it specially stipulates for their carriage to the final point of destination. (*Myrick v. Michigan Central R. R. Co.*, 107 United States Reports, 102.)

Chancellor.—The principal judge of equity (or, what is the same thing, chancery) causes in a state. Only a few states have such an officer. His functions are purely judicial. In states where legal and equitable remedies are administered by the same judges, a judge in disposing of an equity cause is sometimes spoken of as a chancellor, but the meaning is simply that he is performing functions similar to those of a chancellor.

Chancery.—This word is generally used as the synonym of equity. Chancery practice is practice in causes of equity. Chancery courts are equity courts. (See *Equity*.)

Code.—An orderly and systematic statement of the law on one or more large subjects. This word is sometimes used to signify an official revision of the statutes of a state. That, however, simply undertakes to state the existing statute law, not (as is the true office of a code) to combine this with the unwritten or customary law and so turn that into statute also. Most of the states have codes stating the law of pleading in civil actions, and such states are often described as code states to distinguish them from those adhering to the older forms of action, divided between those at law and those in equity. A few states have general codes of political and civil rights. The general drift of legislation and of public sentiment is toward the extension of the principle of codification, but the contrary view has been ably maintained. (See James C. Carter's *Provinces of the Written and the Unwritten Law*, 1889.) New York and Georgia were pioneers in American codification. California has carried it as far as any state.

Common Law, the unwritten or customary law, which is the substratum of the municipal law of each state. For every state, except Louisiana, which has been added since the adoption of the Constitution of the United States, it is (unless otherwise provided by statute) the common law of England as it stood at the early part of the 17th century, subject to such modifications or omissions as were generally considered essential throughout

the old thirteen colonies to adjust it to American conditions, and to such others as were deemed necessary to that end in the states from which most of the early settlers came, and also to such as have been made from time to time since the early settlements, within what are now the limits, by the usages of the people and common consent. It comprehends the main body of the law in each state, which has not a complete code or set of codes. As a matter of fact, it does not essentially differ in any of them. There are occasional points of divergence, but they are few, and seldom of great practical importance.

The common law is to be found in such books as Blackstone's *Commentaries*, Kent's *Commentaries*, and Swift's *Digest*, in unofficial treatises of acknowledged weight on particular topics, and in the reported decisions of the courts. The main work of giving it such form and precision as it may be said to possess has been done by the judges in disposing of actions at law. They have necessarily assumed the function of declaring what of English law the people have treated as unsuited to their social conditions, or obsolete, and also of declaring what has been added to or derived from the ancient common law from time to time.

Offences against the common law can be prosecuted in many states, though not violations of any statute. This is not so in the courts of the United States. The United States has no common law, except so far as its courts have adopted it as to matters of judicial procedure, and as resort must be had to it to explain the meaning of terms used in their constitution or statutes. There are, however, certain uniform rules of general jurisprudence, mainly relating to commercial transactions, which the courts apply without regard to any common law to the contrary existing in any particular state.

Common Pleas, Court of.—This name is given to certain inferior courts in several of the states. These are generally the lowest courts of general jurisdiction in which a jury trial, as at common law, can be had. Frequently they have also equitable jurisdiction over causes involving only small amounts.

Constitutional Law.—The law peculiarly conversant with the effect and meaning of written constitutions of political government. The constitution of the United States is the supreme law of the land as to the matters which it embraces. The constitution of each state is the supreme law of the state, except so far as it may be controlled by the constitution of the United States. Every statute in conflict with the constitution to which it is subordinate is void so far as this conflict extends. If it concerns only a distinct and separable part of the statute, that part only is void. Every court before which a statutory right or defence is asserted has the power to inquire whether the statute in question is or is not in conflict with the paramount Constitution. This power belongs even to a justice of the peace in trying a cause. He sits to administer the law, and it is for him to determine what is the law. Inferior courts commonly decline to hold a statute unconstitutional, even if there may appear to be substantial grounds for such a decision. The presumption is always in favour of the validity of the law, and they generally prefer to leave the responsibility of declaring it void to the higher courts.

The judges of the state courts are bound by their oath of office to support the Constitution of the United States. They have an equal right with those of the United States to determine whether or how far it affects any matter brought in question in any action. So, *vice versa*, the judges of the United States courts, if the point comes up on a trial before them, have the right to determine whether or how far the constitution of a state invalidates a

statute of the state. They, however, are ordinarily bound to follow the views of the state courts on such a question. They are not bound by any decision of a state court as to the effect of the Constitution of the United States on a state statute or any other matter. This judicial power of declaring a statute void because unconstitutional has been not infrequently exercised, from the time when the first state constitutions were adopted.

Juries in criminal causes are sometimes made by American statutes or recognized by American practice as judges of the law as well as the fact. The better opinion is that this does not make them judges of whether a law on which the prosecution rests violates the paramount Constitution and is therefore void. (*United States v. Callender*, Wharton's *State Trials*, 688; *State v. Main*, 69 Connecticut Reports, 123, 128.)

If a state court decides a point of constitutional law, set up under the Constitution of the United States, against the party relying upon it, and this decision is affirmed by the state court of last resort, he may sue out a writ of error, and so bring his case before the Supreme Court of the United States. If the state decision be in his favour, the other side cannot resort to like proceedings.

A decree of the Supreme Court of the United States on a point of construction arising under the Constitution of the United States settles it for all courts, state and national.

Contempt of Court.—The maximum punishment for this offence is generally fixed by statute. It is also a common provision of statute that courts cannot punish for contempts committed out of court, unless in such circumstances as immediately to affect the administration of justice. (See United States Revised Statutes, § 725.) American legislative bodies (being without any judicial functions) have not the power to punish for contempt possessed by the Houses of Parliament in England. (*Kilbourn v. Thompson*, 103 United States Reports, 168.)

Corporation.—The United States and each state, each territory, and municipalities in general, are public corporations. They are public agencies for public purposes. Private corporations are those formed for private, or partly for private and partly for public purposes. The United States can create corporations so far as may be necessary for the proper execution of their general powers, but these powers being few, the corporations which it has created are not numerous. Most of them are national banking associations. The organized territories of the United States can create corporations by general incorporation laws, and there are many which have been thus formed. The earlier American corporations were all created by special charter, but the practice of permitting incorporation under general incorporation laws under equal terms to all, which was instituted in the 19th century in some of the states, though at first confined to religious societies, library companies, &c., has gradually spread, until it is now almost the rule. Many of the states have constitutions forbidding special charters for corporations, and in the others most incorporations are effected under appropriate general laws. The charter of a private corporation creates a contract between the corporation and the state, which, under the provisions of the Constitution of the United States, cannot be substantially altered without the consent of the corporation, unless a power to that effect was reserved at the time of the incorporation. Such a power is generally reserved, but even then cannot extend to radical and fundamental changes.

The franchises of municipal corporations can be revoked or altered at the pleasure of the state. They are mere agencies for the public good, and, if better ones can be provided, that should be done. Municipal corporations

have, besides the powers expressly granted, such as are necessary for their proper execution or indispensable to attaining the object of the incorporation. Private corporations have such implied powers as are fairly incident to the convenient exercise of those expressly granted.

If a corporation assumes to make a contract beyond its powers, the better opinion is that the contract is void. If, in consequence of it, acts have been done, or values received, these may support an action, not because the contract gave rights, but because the transaction did. Thus there may be a liability to account for benefits received. The contract in such case may be available in evidence for certain purposes, e.g., to limit the recovery to the stipulated price. (*Central Transportation Co. v. Pullman's Palace Car Co.*, 139 United States Reports, 24; *Pullman's Palace Car Co. v. Central Transportation Co.*, *ibid.* 62; *California Bank v. Kennedy*, 167 United States Reports, 362.)

If a private corporation becomes insolvent, and falls into the hands of the courts, its assets are treated as a trust fund for the benefit of its creditors. It does not occupy the position of a trustee towards creditors so long as it is a going concern, under the control of its own managers, and not in a state of insolvency. (*Hollins v. Brierfield Coal and Iron Co.*, 150 United States Reports, 371.)

American law differs from the English in recognizing the right of a corporation to adopt or ratify the contracts of its promoters made before its organization. (See Taylor on *Private Corporations*, sec. 87.)

American law also regards directors of corporations as agents of the law, who, when acting as a board, are the general agent of the company, by force of the law. English law looks upon them rather as special agents of the corporation, and so constituted by the agreement of the shareholders. (See Thompson on *Private Corporations*, III., 2881.)

Court.—The United States is divided into a large number of judicial districts, of which each state embraces one or more, each with a separate district court held by a district judge. Several of these districts are created in each circuit, of which there are nine. In each circuit there are one or more circuit judges, who may hold circuit courts, as may also the district judge. The district and circuit courts are courts of original jurisdiction. That of the district court is mainly confined to causes in admiralty or bankruptcy, or in which the United States is a party, including criminal cases. That of the circuit court extends to matters of both common law and equity, where the adverse parties are citizens of different states or where the case arises under the laws of the United States, but ordinarily not unless \$2000 in value is in controversy. It has also jurisdiction in all criminal prosecutions. In each circuit there is a circuit court of appeal having appellate jurisdiction only. This jurisdiction is final as to most causes, but does not extend to the determination of errors assigned on points arising under the Constitution of the United States. This court is held by three of the circuit judges. A district judge may also sit in the place of a circuit judge.

The Supreme Court of the United States sits only at Washington, and consists of a Chief Justice and eight associate justices. Its jurisdiction is mainly appellate. Appeals from the inferior federal courts lie to it on points arising under the Constitution of the United States, and in capital causes. It can revise the judgments of the highest court of any state on a claim of right raised under the Constitution, laws, or treaties of the United States, if the decision was adverse to such claim. The justices can also sit in the circuit courts and circuit courts of appeal.

A circuit court can be held by one judge, or by two, or by three. If two sit, the opinion of the ranking judge prevails for the purposes of the case if a difference of opinion arises between them in the course of the trial.

Prize cases are appealed directly from the district court to the Supreme Court.

Causes can be removed, before trial, from a state court to a circuit court of the United States, in certain circumstances.

There is also a court of claims sitting at Washington, having cognizance only of claims against the United States. Such claims may also be sued in the district court, if for not over \$1000, and in the circuit court, if for not over \$10,000.

There is a court of private land claims, of a temporary character, to pass upon claims against the United States respecting lands in certain parts of the Far West.

In the District of Columbia there is a separate judicial system, with a local court of appeals.

Each territory has a separate judicial system, established by Act of Congress.

Each state has a separate judiciary of its own. In most it is as follows: justices of the peace are allowed to dispose of petty causes, civil and criminal (subject to an appeal), and to bind over those charged with grave offences for trial before a jury in a higher court. In cities and other considerable municipalities there are local courts, having a larger jurisdiction over civil and criminal causes. In each county there are one or more courts, known as county courts, courts of common pleas, or superior courts. These are the main courts of original jurisdiction, and also have some appellate jurisdiction over proceedings before the tribunals previously mentioned. They administer both legal and equitable relief, generally in one form of action. Above all is a supreme court, sometimes styled a court of appeals, or a supreme court of errors, with only appellate jurisdiction. An intermediate appellate court is sometimes created to relieve the higher court of an undue pressure of business. Some of the supreme courts dispose of as many as 600 cases a year. Their opinions are, in all important causes, delivered in writing, and published in a series of state reports at the expense of the state, an official reporter being attached to each court. The practice in this respect is the same in the Supreme Court of the United States.

The opinions of the circuit court of appeals and of the circuit and district courts are published unofficially by private reporters. Those of all the courts of last resort in each of the states are likewise published unofficially in the same way, in advance of their appearance in the regular series of state reports. Selected current cases from the United States and state reports are also made the subject of two series of private reports known as the American State Reports and Lawyers' Reports Annotated.

Criminal Procedure.—Each state, as well as the United States, prosecutes for crimes against itself. In every state there are local prosecuting officers in the small political subdivisions of territory, such as counties, towns, cities, and boroughs, who institute criminal proceedings and conduct the hearing which follows the arrest.

The criminal procedure of the United States is in general based upon that of the respective states. A prosecution for a crime against the United States, committed in Ohio, for instance, would be brought by a complaint and warrant such as are used in the state courts of Ohio under the law of that state, while in Kentucky the law and practice of Kentucky would be followed.

Arrests for violations of the law of the United States

are commonly made upon a warrant signed by a federal official, known as a district court commissioner; but a state magistrate has equal authority to sign such warrants. (United States Revised Statutes, sec. 1014.) If the law of the state requires a complaint under oath in prosecutions for offences against the state, complaints charging the commission in that state of a crime against the United States must be made under oath, otherwise not. In many states the local state prosecuting officer can complain as of his own knowledge, without annexing any statement or charge emanating from any other person, and thereupon a warrant issues. In such states the same power belongs to the district attorney of the United States, who is the public prosecutor for all offences against the laws of the United States.

Bail (in a sum fixed by the committing magistrate) is a matter of right in all cases where a sentence of death cannot be inflicted. (*Ibid.* sec. 1015.) In those where such a sentence can be, it may be allowed by one of the judges of the United States courts at his discretion. (*Ibid.* sec. 1016.)

These provisions govern proceedings instituted in the limits of any state.

Each territory fully organized by Act of Congress has its own legislative assembly, which regulates criminal procedure, subject only to the guarantees of individual rights found in the Constitution of the United States.

The District of Columbia has a system provided by Act of Congress, and founded on that formerly in use in the state of Maryland, out of which the territory forming this district was carved.

Equity.—The courts of the United States still maintain an absolute separation between actions at law and actions in equity. Procedure in the latter is settled by rules of court, and is substantially uniform throughout the United States. Procedure in the former follows in general the law of the state in which the court may be held. Some of the states also administer equitable relief only in strict and separate equitable proceedings. In most, beginning with New York in 1848, there is now but one kind of action, based on a plain statement of the facts constituting the plaintiff's case, without any artificial restrictions of form. If a cause involving both legal and equitable causes of action is removed before trial from a state court, where such a system obtains, into a circuit court of the United States, the plaintiff is obliged to re-plead and split his suit into two; one in the form of a bill in equity, and one in the form appropriate to an action in such state brought on a legal demand only.

Factor.—Judge Story, both on the bench and in his work on *Agency*, adhered to the doctrine, held by the English courts until a recent period, that a factor under a *del credere* (or guarantee) commission was a mere surety for the purchaser, and only answerable to his principal, if payment were not made by the purchaser. The courts of several of the leading commercial states early took the opposite view, holding the factor liable at all events for the proceeds of the sale, and this, of late years, has become firmly established as the prevalent American view. (See *Lewis Brothers v. Brehone*, 33 Maryland Reports, 412; 3 American Reports, 190.) Legislation similar to the English Factors Act of 1825 has been had in several states. (See *Allen v. St Louis Bank*, 120 United States Reports, 20.)

Information.—A complaint charging a criminal offence, preferred by a public prosecutor, without any previous inquiry by a grand jury. In many American states an indictment is only necessary in capital cases; in some it is entirely dispensed with. In the courts of the United States an indictment is required in all cases of crimes punishable by imprisonment in the penitentiary by force

of the Vth Amendment to the Constitution. *Quo warranto* proceedings are also commonly brought by an information.

Injunction.—In the courts of the United States the writ of injunction remains purely an equitable remedy. It may be issued at the instance of the President to prevent any organized obstruction to inter-state commerce or to the passage of the mails. (*In re Debs*, 158 United States Reports, 564.) Temporary restraining orders may be issued, *ex parte*, pending an application for a temporary injunction. In the state courts temporary injunctions are often issued, *ex parte*, subject to the defendant's right to move immediately for their dissolution. Generally, however, notice of an application for a temporary injunction is required.

Jury.—The right of trial by jury, both in civil cases of a common-law nature and in criminal causes, is secured to all, with important exceptions, by constitutional provisions both as respects the United States and the several states. Some constitutions provide for dispensing with the rule of unanimity in civil causes. In some states a few petty offences may be finally disposed of by a single magistrate. In criminal causes, as juries can bring in a general verdict of "Not guilty," they have the actual power to acquit should they be of opinion that the statute under which the prosecution may be had is void. Their duty, however, is generally held to be to accept the law from the court, especially if it turn upon the effect of the Constitution. Jury trials in some states can be ordered in equitable causes or divorce cases; in others, and in the courts of the United States, they can only be had in causes not of an equitable character, unless specially ordered for the information of the judge on a "feigned issue"—that is, a question of fact stated by the court for the purpose of obtaining a precise answer, by which the judgment of the court may or may not be guided according to its discretion. In some states the judges are forbidden in criminal causes to give the jurors any direction as to how to find the law, or to express any opinion upon the evidence. In others such an opinion may be freely expressed, and they can be told that it is their duty to return a certain verdict if they find the controlling facts in a certain way (*State v. Fetterer*, 65 Connecticut Reports, 287).

Lotteries.—The United States at an early period (1812) empowered the city of Washington to set up lotteries as a mode of raising money for public purposes; but no lotteries were ever directly authorized by Congress itself after the adoption of the Constitution of the United States. In 1890 it forbade the use of the mails for promoting any lottery enterprise by a statute so stringent that it was held to make it a penal offence to employ them to further the sale of Austrian Government bonds, issued under a scheme for drawing some by lot for payment at a premium (see *Horner v. United States*, 147 United States Reports, 449). Lotteries of every sort were formerly permitted in most of the American colonies and states, but of late years have been generally prohibited by state legislation (see *Journal of the American Social Science Association*, xxxvi. 17).

Perpetuities.—The common-law rule against perpetuities (as to the vesting of estates within one or more lives in being and twenty-one years afterwards, with a further allowance of nine months in favour of an unborn child) obtains in many of the states; in others it has been placed or reinforced by statutory rules, such as limiting the postponement of future estates by two lives, &c. Conditions are not regarded here as subject to the common-law rule (Gray on *Alienation*, § 42). There is a difference of judicial opinion as to the application of this rule. By some courts it is held to concern itself only with the time within which an estate must vest, and to have nothing

to do with the time during which an estate which has once properly vested may continue. By others it is held to prohibit the creation of estates to continue longer than the period specified (see Gray on *Perpetuities*; *Lovering v. Worthington*, 106 Massachusetts Reports, 86). Charities may be established in perpetuity, and provision may be made for an accumulation of the funds for a reasonable time, e.g., for 100 years (*Woodruff v. Marsh*, 63 Connecticut Reports, 125; 38 American State Reports, 346). The general tendency of American legislation and decision is to favour tying up estates for public purposes to a greater extent than was formerly approved.

Real Estate.—The tenure of land is generally allodial. Where estates tail are allowed by law, it is often on condition that they become absolute in the issue of the first donee. Real estate titles are secured, to a degree unknown in Great Britain, against impairment by legislation, through constitutional provisions, both state and national, particularly that against depriving any person of property without due process of law.

Registration.—American legislation favours the general policy of registering all documents in the contents of which the public have an interest, and its tendency has been steadily towards more and more full registration both of documents and statistics. From the early days of the colonial era it has been customary to record wills and conveyances of real estate in full in public books, suitably indexed, to which free access was given. During the last decade of the 19th century, three states—Illinois, Massachusetts, and Ohio—adopted the main features of the Torrens or Prussian system for registering title to land rather than conveyances under which title may be claimed. These are the ascertainment by public officers of the state of the title to some or all of the parcels of real estate which are the subject of individual property within the state; the description of each parcel (giving its proper boundaries and characteristics) on a separate page of a public register, and of the manner in which the title is vested; the issue of a certificate to the owner that he is the owner; the official notation on this register of each change of title thereafter; and a warranty by the Government of the title to which it may have certified. To make the system complete it is further requisite that every landowner should be compelled to make use of it, and that it should be impossible to transfer a title effectually without the issue of such a Government certificate in favour of the purchaser.

Constitutional provisions have been found to prevent or embarrass legislation in these directions in some of the states, but it is believed that they are nowhere such as cannot be obeyed without any serious encroachment on the principles of the new system (*People v. Chase*, 165 Illinois Reports, 527; *State v. Guilbert*, 56 Ohio State Reports, 575; *People v. Simon*, 176 Illinois Reports, 165; *Tyler v. Judges*, 173 Massachusetts Reports; 55 North-Eastern Reporter, 812; *Hamilton v. Brown*, 161 United States Reports, 256).

Conveyances which have been duly recorded become of comparatively little importance in the United States. The party claiming immediately under them, if forced to sue to vindicate his title, must produce them, or account for their loss; but any one deriving title from him can procure a certified copy of the original conveyance from the recording officer, and rely on that. Equitable mortgages by a deposit of title-deeds are unknown.

The general prevalence of public registry systems has had an influence in the development of American jurisprudence in the direction of supporting provisions in wills and conveyances, which, unless generally known, might tend to mislead and deceive, such as spendthrift trusts (*Nichols v. Eaton*, 91 United States Reports, 716).

Riparian Laws.—The common-law right of riparian proprietors on running streams to have the water continue to flow in its usual and natural course has been abrogated in many of the Western states in consequence of their physical geography and peculiar industries. In mining states and those having large stretches of arid lands, the use of all the water that can be got is of the greatest benefit. The upper proprietors are therefore allowed to divert water for mining or agricultural purposes to the prejudice of lower proprietors, even to the extent of virtually appropriating the entire stream, except in the wet season. The general rule is that priority of appropriation gives priority of right (*Basey v. Gallagher*, 20 Wallace's Reports, 670). The state has a paramount right to regulate the use of rivers for public purposes in the public interest. In some states this is held to justify an appropriation of the water for a canal (*People v. Canal Appraisers*, 33 New York Reports, 461. Cf. *Kaukauna Co. v. Green Bay Canal Co.*, 142 United States Reports, 254). It may be exercised to the prejudice of prior grants from the state for private purposes. These are taken subject to such future control (*Water Power Co. v. Water Commissioners*, 168 United States Reports, 349, 372). Secondary rights are held subject to primary rights. The use of water for drinking is a primary right; its use for manufacturing a secondary one (*City of Auburn v. Union Water Power Co.*, 93 Maine Reports; 38 Atlantic Reporter, 561). Rights in water-courses through public lands are regulated by United States Revised Statutes, §2476. The United States can restrain by injunction the appropriation of the upper waters tributary to a navigable river, if this would interfere with its navigability (*United States v. Rio Grande Irrigation Co.*, 174 United States Reports, 690). They can improve the navigation of any navigable waters by erections in the water which cut off access to the channel of a riparian proprietor, without making compensation (*Gibson v. United States*, 166 United States Reports, 269).

Succession Duty.—The United States imposed a succession duty by the War Revenue Act of 1898 on all legacies or distributive shares of personal property exceeding \$10,000. It is a tax on the privilege of succession. Devises or distributions of land are not affected by it. The rate of duty runs from 75 cents on the \$100 to \$5 on the \$100, if the legacy or share in question does not exceed \$25,000. On those of over that value the rate is multiplied $1\frac{1}{2}$ times on estates up to \$100,000, twofold on those from \$100,000 to \$500,000, $2\frac{1}{2}$ times on those from \$500,000 to a million, and threefold for those exceeding a million. This statute has been supported as constitutional by the Supreme Court. Many of the states also impose succession duties, or transfer taxes; generally heavier on collateral and remote successions; sometimes progressive according to the amount of the succession. The state duties generally touch real estate successions as well as those to personal property. If a citizen of state A own registered bonds of a corporation chartered by state B, which he has put for safe keeping in a deposit vault in state C, his estate may thus have to pay four succession taxes, one to state A, where he belongs and which, by legal fiction, is the seat of all his personal property; one to state B, for permitting the transfer of the bonds to the legatees on the books of the corporation; one to state C, for allowing them to be removed from the deposit vault for that purpose; and one to the United States.

Treaty.—By the terms of Article VI. of the Constitution of the United States, all treaties made under their authority are the supreme law of the land. This gives them a new quality. They are no longer mere matters of contract. They stand on the same ground as an Act of Congress.

Any state constitution or law in conflict with them must give way. So must any prior Act of Congress. On the other hand, a later Act of Congress may abrogate a treaty; for both are equally in their nature the supreme law of the land, and the latter of two laws prevails over the former. (S. E. B.)

Lawes, Sir John Bennet, BART. (1814–1900), English agriculturist, was born at Rothamsted on 28th December 1814. Even before leaving Oxford, where he matriculated in 1832, he had begun to interest himself in growing various medicinal plants on the Rothamsted estates, which he inherited on his father's death in 1822. About 1837 he began to experiment on the effects of various manures on plants growing in pots, and a year or two later the experiments were extended to crops in the field. One immediate consequence was that in 1842 he patented a manure formed by treating phosphates with sulphuric acid, and thus started the artificial manure industry. In the succeeding year he enlisted the services of Sir J. H. Gilbert, with whom he carried on for more than half a century those experiments in raising crops and feeding animals which have rendered Rothamsted famous in the eyes of scientific agriculturists all over the world (see also AGRICULTURE). In 1854 he was elected a Fellow of the Royal Society, which in 1867 bestowed a Royal medal on him and Gilbert jointly, and in 1882 he was created a baronet. In the year before his death, which happened on 31st August 1900, he took measures to ensure the continued existence of the Rothamsted experimental farm by setting aside £100,000 for that purpose and constituting the Lawes Agricultural Trust, which is composed of four members from the Royal Society, two from the Royal Agricultural Society, one each from the Chemical and Linnæan Societies, and the owner of Rothamsted mansion-house for the time being.

Lawrence, a city of Kansas, U.S.A., capital of Douglas county, on the south bank of the Kansas river, at an altitude of 822 feet. It is on the main line of the Atchison, Topeka, and Santa Fé, and on the Kansas Pacific branch of the Union Pacific railways. Its site is level and its plan regular. The University of Kansas, situated here, had in 1899 a faculty of 69, and was attended by 1087 students, 413 of whom were women. Population (1890), 9997; (1900), 10,862, of whom 781 were foreign-born and 2032 were negroes.

Lawrence, a city of Massachusetts, U.S.A., capital of Essex county, on the Merrimac river. It is divided into six wards, is supplied with water pumped from the Merrimac and filtered, and is paved mainly with macadam and gravel. It is an important centre of the woollen and cotton goods trade, especially of the former. In 1900 it contained 546 manufacturing establishments, with an aggregate capital of \$49,914,035, employing 22,358 hands, and with a product valued at \$44,703,278. Of this total product, \$25,584,744 was composed of woollen and worsted goods, \$8,146,594 of cotton goods, and \$1,608,224 of flouring and grist-mill products. Machines and machinery, paper, and food products were also prominent articles of manufacture. In 1900 the assessed valuation of real and personal property was \$39,841,697; the net debt was \$1,830,300, and the rate of taxation was \$15.60 per \$1000. Population (1890), 44,654; (1900), 62,559, an increase of 40.1 per cent. during the preceding ten years. Of the population in 1900, 28,577 were foreign-born and 87 were negroes.

Lawrenceburg, a city of Indiana, U.S.A., capital of Dearborn county, on the Ohio river and the Baltimore and Ohio South-western, and the Cleveland, Cincinnati,

Chicago, and St Louis railways, at an altitude of 486 feet. It has varied manufactures and some commerce by rail and by river. Population (1890), 4284; (1900), 4326, of whom 413 were foreign-born.

Lawson, Cecil Gordon (1851–1882), English landscape painter, was the youngest son of William Lawson, of Edinburgh, esteemed as a portrait painter. His mother also was known for her flower pieces. He was born near Shrewsbury, 3rd December 1851. Two of his brothers (one of them, Malcolm, a clever musician and songwriter) were trained as artists, and Cecil was from childhood devoted to art with the intensity of a serious nature. Soon after his birth the Lawsons moved to London. In 1866 they were in Bloomsbury, in 1867 at Chelsea. Lawson's first works were studies of fruit, flowers, &c., in the manner of W. Hunt; followed by riverside Chelsea subjects. His first exhibit at the Royal Academy (1870) was "Cheyne Walk," and in 1871 he sent two other Chelsea subjects. These gained full recognition from fellow-artists, if not from the public. Among his friends were now numbered Fred Walker, Pinwell, and their associates. Following them, he made a certain number of drawings for wood-engraving. Lawson's Chelsea pictures had been painted in somewhat low and sombre tones; in the "Hymn to Spring" of 1872 (rejected by the Academy) he turned to a more joyous play of colour, an expansion helped by work in more romantic scenes in North Wales and Ireland. Early in 1874 he made a short tour in Holland, Belgium, and Paris; and in the summer he painted his large "Hop Gardens of England." This was much praised at the Academy of 1876. But Lawson's triumph was with the great luxuriant canvas "The Minister's Garden," exhibited in 1878 at the Grosvenor Gallery, and now in the Manchester Art Gallery. This was followed by several works conceived in a new and tragic mood. His health began to fail, but he worked on. He married in 1879 the daughter of Birnie Philip, and settled at Haslemere. His later subjects are from this neighbourhood (the most famous being "The August Moon," now in the National Gallery of British Art) or from Yorkshire. Towards the end of 1881 he went to the Riviera, returned in the spring, and died at Haslemere 10th June 1882. Lawson may be said to have restored to English landscape the tradition of Gainsborough, Crome, and Constable, infused with an imaginative intensity of his own. Among English landscape painters of the latter part of the 19th century his is in many respects the most interesting name.

See *Cecil Lawson, a Memoir*, by E. W. Gosse, 1893.—HESELTINE OWEN. "In Memoriam: Cecil Gordon Lawson," *Magazine of Art*, 1894. (L. B.)

Lawson, Sir Wilfrid, 2nd BART. (1829—), English politician and Temperance leader, son of the first baronet (d. 1867), was born 4th September 1829. He was always an enthusiast in the cause of total abstinence, and in Parliament, to which he was first elected in 1859 for Carlisle, he became its leading spokesman. In 1864 he first introduced his Permissive Bill, giving to a two-thirds majority in any district a veto upon the granting of licences for the sale of intoxicating liquors; and though this principle failed to be embodied in any Act, he had the satisfaction of seeing a resolution on its lines accepted by a majority in the House of Commons in 1880, 1881, and 1883. He lost his seat for Carlisle in 1865, but in 1868 was again returned as a supporter of Mr Gladstone, and was member till 1885; though defeated for the new Cocker-mouth division of Cumberland in 1885, he won that seat in 1886, and he held it till the election of 1900, when his violent opposition to the Boer war caused his defeat. For all these years he was the champion of the

United Kingdom Alliance (founded 1853), of which he became president. An extreme Radical, he also supported disestablishment, abolition of the House of Lords, and disarmament. Though violent in the expression of his opinions, Sir Wilfrid Lawson remained very popular for his own sake both in and out of the House of Commons; he became well known for his humorous vein, his faculty for composing topical doggerel being often exercised on questions of the day.

Layard, Sir Henry Austen (1817–1894), British author and diplomatist, and the excavator of Nineveh, was born in Paris on 5th March 1817. The Layards were of Huguenot descent. His father, Henry P. J. Layard, of the Ceylon Civil Service, was the son of Charles Peter Layard, dean of Bristol, and grandson of Daniel Peter Layard, the physician. Through his mother, a daughter of Nathaniel Austen, banker, of Ramsgate, he inherited Spanish blood. This strain of cosmopolitanism must have been greatly strengthened by the circumstances of his education. Much of his boyhood was spent in Italy, where he received part of his schooling, and acquired a taste for the fine arts and a love of travel; but he was at school also in England, France, and Switzerland. After spending nearly six years in the office of his uncle, Benjamin Austen, a solicitor, he was tempted to leave England for Ceylon by the prospect of obtaining an appointment in the Civil Service, and he started in 1839 with the intention of making an overland journey across Asia. After wandering for many months, chiefly in Persia, and having abandoned his intention of proceeding to Ceylon, he returned in 1842 to Constantinople, where he made the acquaintance of Sir Stratford Canning, the British ambassador, who employed him in various unofficial diplomatic missions in European Turkey. In 1845, encouraged and assisted by Canning, Layard left Constantinople to make those explorations among the ruins of Assyria with which his name is chiefly associated. This expedition was in fulfilment of a design which he had formed, when, during his former travels in the East, his curiosity had been greatly excited by the ruins of Nimroud on the Tigris, and by the great mound of Kuyunjik, near Mosul, already partly excavated by M. Botta. Layard remained in the neighbourhood of Mosul, carrying on excavations at Kuyunjik and Nimroud, and investigating the condition of various tribes, until 1847; and, returning to England in 1848, published *Nineveh and its Remains: with an Account of a Visit to the Chaldean Christians of Kurdistan, and the Yezidis, or Devil-worshippers; and an Inquiry into the Manners and Arts of the Ancient Assyrians* (2 vols., 1848–1849). To illustrate the antiquities described in this work he published a large folio volume of *Illustrations of the Monuments of Nineveh* (1849). After spending a few months in England, and receiving the degree of D.C.L. from the University of Oxford, Layard returned to Constantinople as attaché to the British Embassy, and, in August 1849, started on a second expedition to the East, in the course of which he extended his investigations to the ruins of Babylon and the mounds of southern Mesopotamia. His record of this expedition, *Discoveries in the Ruins of Nineveh and Babylon*, which was illustrated by another folio volume, called *A Second Series of the Monuments of Nineveh*, was published in 1853. During these expeditions, often in circumstances of great difficulty, Layard despatched to England the splendid specimens which now form the greater part of the collection of Assyrian antiquities in the British Museum. Apart from the archæological value of his work in identifying Kuyunjik as the site of Nineveh (see the article NINEVEH, *Ency. Brit.* vol. xvii. p. 511), and in providing a great

mass of materials for scholars to work upon, these two books of Layard's are among the best-written books of travel in the language.

Layard now turned to politics. Elected as a Liberal member for Aylesbury in 1852, he was for a few weeks Under Secretary for Foreign Affairs, but afterwards freely criticized the Government, especially in connexion with army administration. He was present in the Crimea during the war, and was a member of the committee appointed to inquire into the conduct of the expedition. In 1855 he refused from Lord Palmerston an office not connected with foreign affairs, was elected Lord Rector of Aberdeen University, and on 15th June moved a resolution in the House of Commons (defeated by a large majority) declaring that in public appointments merit had been sacrificed to private influence and an adherence to routine. After being defeated at Aylesbury in 1857, he visited India to investigate the causes of the Mutiny. He unsuccessfully contested York in 1859, but was elected for Southwark in 1860, and from 1861 to 1866 was Under Secretary for Foreign Affairs in the successive administrations of Lord Palmerston and Lord John Russell. In 1866 he was appointed a trustee of the British Museum, and in 1868 Chief Commissioner of Works in Mr Gladstone's Government and a member of the Privy Council. He retired from Parliament in 1869, on being sent as Envoy Extraordinary to Madrid. In 1877 he was appointed by Lord Beaconsfield ambassador at Constantinople, where he remained until Mr Gladstone's return to power in 1880, when he finally retired from public life. In 1878, on the occasion of the Berlin Conference, he received the order of the Grand Cross of the Bath. Layard's political life was a somewhat stormy one. His manner was brusque, and his advocacy of the causes which he had at heart, though always perfectly sincere, was vehement to the point sometimes of recklessness. Layard retired to Venice, where he devoted much of his time to collecting pictures of the Venetian school, and to writing on Italian art. On this subject he was a disciple of his friend Morelli, whose views he embodied in his revision of Kugler's *Handbook of Painting, Italian Schools* (1887). He wrote also an introduction to Miss Ffoulkes's translation of Morelli's *Italian Painters* (1892-3), and edited that part of Murray's *Handbook of Rome* (1894) which deals with pictures. In 1887 he published, from notes taken at the time, a record of his first journey to the East, entitled *Early Adventures in Persia, Susiana, and Babylonia*. An abbreviation of this work, which as a book of travel is even more delightful than its predecessors, was published in 1894, shortly after the author's death, with a brief introductory notice by Lord Aberdare. Layard also from time to time contributed papers to various learned societies, including the Huguenot Society, of which he was first president. He died in London on 5th July 1894.

Lazarus, Henry (1815-1895), British clarinettist, was born in London, 1st January 1815, and was a pupil of Blizard, bandmaster of the Royal Military Asylum, Chelsea, and subsequently of Charles Godfrey, senior, bandmaster of the Coldstream Guards. He made his first appearance as a soloist at a concert of Mme Dulcken's, in April 1838, and in that year he was appointed as second clarinet to the Sacred Harmonic Society. From Willman's death in 1840 Lazarus was principal clarinet at the opera, and all the chief festivals and orchestral concerts. His beautiful tone, excellent phrasing, and accurate execution were greatly admired. He was professor of the clarinet at the Royal Academy of Music from 1854 until within a short time of his death, and was appointed

to teach his instrument at the Military School of Music, Kneller Hall, in 1858. His last public appearance was at a concert got up for his benefit in St James's Hall, in June 1892, and he died 6th March 1895. (J. A. F. M.)

Lead, a city of Lawrence county, South Dakota, U.S.A. It is in the Black Hills, in a prosperous mining region, and is entered by two railways. Population (1890), 2581; (1900), 6210, of whom 2145 were foreign-born.

Lead.—In the last twenty years of the 19th century the lead-smelting industry underwent important changes. Most of these were the result of new conditions arising in the United States, where the treatment of the ores is carried out, not in small works near the mines, but in large centrally-situated smelting plants, to which the ores are shipped from various mining regions. As the competition is considerable, all the details of work have been greatly improved, the cost reduced, and the yield increased. Lead ores are smelted in the reverberatory furnace, the ore-hearth, and the blast-furnace. The use of the first two is restricted, as they are suited only for galena ores (the more common) or mixtures of galena and carbonate, which contain not less than 58 per cent. lead and not more than 4 per cent. silica; further, ores to be treated in the ore-hearth should run low in or be free from silver, as the loss in the fumes is excessive. In the blast-furnace all lead ores are successfully smelted. Blast-furnace treatment has therefore become more general than any other.

To the two methods of working in the reverberatory furnace, represented by the English and Carinthian furnaces (described in *Ency. Brit.* vol. xiv. p. 375) a third, the Silesian, must be added. While by the former processes as much lead as possible is extracted in the furnace, with the Silesian method a very low temperature is used, thus taking out about one-half of the lead and leaving very rich slags (50 per cent. lead) to be smelted in the blast-furnace, the ultimate result being a very much higher yield than by either of the other processes. The Silesian furnace has an oblong hearth, 16 feet by 8 feet 10 inches, sloping from the fire-bridge to the flue-bridge. This causes the lead to collect at the coolest part of the hearth, whence it is tapped, &c., as in the English furnace. A charge of 6180 pounds galena ore (70 per cent. lead) is worked in twelve hours with three men, 0.46 ton of coal being consumed per ton of ore charged. The loss in lead by the combined reverberatory and blast-furnace treatment is only 3.2 per cent.

In the hearth process the blocks of cast-iron forming the sides and back of the Scottish furnace (see *Ency. Brit.* vol. xiv. p. 375) are now generally replaced in the United States by water-cooled shells (water-jackets) of cast-iron. In this way continuous working has been rendered possible, whereas formerly operations had to be stopped every twelve or fifteen hours to allow the over-heated blocks and furnace to cool down. The latest improvement (which somewhat changes the mode of working) is that by Moffett. While he also prevents interruption of the operation by means of water-jackets, he uses hot-blast, and produces, besides metallic lead, large volumes of lead fumes which are drawn off by fans through long cooling tubes, and then forced through suspended bags which filter off the dust, called blue powder. This, a mixture of lead sulphate (45 per cent.) and oxide (44 per cent.) with some sulphide (8 per cent.), zinc, and carbonaceous matter, is agglomerated by a heap-roast, and then smelted in a slag-eye furnace with gray slag from the ore-hearth. The furnace has, however, in addition to the usual tuyères near the bottom, a second set near the throat in order to effect a complete oxidation of all combustible matter. Much fume is thus

produced. This is drawn off, cooled and filtered, and forms a white paint of good body, consisting of about 65 per cent. lead sulphate, 26 per cent. lead oxide, 6 per cent. zinc oxide, and 3 per cent. other substance. Thus in the Moffett method it is no matter whether metal or fume is produced, as in either case it is saved and the price is about the same.

In smelting at once in the same blast-furnace ores of different character, the old use of separate processes of precipitation, roasting and reduction, and general reduction prevailing in the Harz Mountains (see *Ency. Brit.* vol. xiv. p. 376), Freiberg, and other places, to suit local conditions, has had to be abandoned. Ores are smelted raw if the fall of matte (metallic sulphide) does not exceed 5 per cent.; otherwise they are subjected to a preliminary oxidizing roast to expel the sulphur, unless they run too high in silver, say 100 ounces to the ton, when they are smelted raw. The leading reverberatory furnace for roasting lead-bearing sulphide ores has a level hearth 14-16 feet wide and 60-80 feet long. It puts through 9-12 tons of ore in twenty-four hours, reducing the percentage of sulphur to 2-4 per cent., and requires four to six men and about two tons of coal. In many instances it has been replaced by mechanical furnaces, which are now very common in roasting sulphide copper ores. (See ACID AND ALKALI MANUFACTURE.) A modern blast-furnace is oblong in horizontal section and about 24 feet high from furnace floor to feed floor. The shaft, resting upon arches supported by four cast-iron columns about 9 feet high, is usually of brick, red brick on the outside, fire-brick on the inside; sometimes it is made of wrought-iron water-jackets. The smelting zone always has a bosh and a contracted tuyère section. It is enclosed by water-jackets, which are usually cast-iron, sometimes mild steel. The hearth always has an Arents siphon tap. This is an inclined channel running through the side-wall, beginning near the bottom of the crucible and ending at the top of the hearth, where it is enlarged into a basin. The crucible and the channel form the two limbs of an inverted siphon. While the furnace is running the crucible and channel remain filled with lead; all the lead reduced to the metallic state in smelting collects in the crucible, and rising in the channel, overflows into the basin, whence it is removed. The slag and matte formed float upon the lead in the crucible and are tapped, usually together, at intervals into slag-pots, where the heavy matte settles on the bottom and the light slag on the top. When cold they are readily separated by a blow from a hammer. The following table gives the dimensions of some well-known American lead-furnaces:—

Lead Blast-Furnace.

Locality.	Year.	Tuyère Section.	Height, Tuyère to Throat.
		Inches.	Feet.
Leadville, Colorado . .	1880	33 × 84	14
Denver, "	1880	36 × 100	17
Durango, "	1882	36 × 96	12·6
Denver, "	1892	42 × 100	16
Leadville, "	1892	42 × 120	18
Salt Lake City, Utah . .	1895	45 × 140	20

A furnace, 42 by 120 inches at the tuyères, with a working height of 17-20 feet, will put through in twenty-four hours, with twelve men, 12 per cent. coke, and 2 lb blast-pressure, 85-100 tons average charge, i.e., one that is medium coarse, contains 12-15 per cent. lead, not over 5 per cent. zinc, and makes under 5 per cent. matte. In making up a charge, the ores and fluxes, whose chemical compositions have been determined, are mixed so as to form out of the components, not to be reduced to the metallic or sulphide state, typical slags (silicates of

ferrous and calcic oxides, incidentally of aluminium oxide, which have been found to do successful work). Such slags contain SiO₂ 30-33 per cent., Fe(Mn)O 27-50 per cent., Ca(Mg,Ba)O 12-28 per cent., and retain less than 1 per cent. lead and 1 ounce silver to the ton. The leading products of the blast-furnace are argentiferous lead (base bullion), matte, slag, and flue-dust (fine particles of charge and volatilized metal carried out of the furnace by the ascending gas current). The base bullion (assaying 300 ± ounces per ton) is desilverized (see below); the matte (Pb 8-12 per cent., Cu 3-4 per cent., Ag $\frac{1}{2}$ - $\frac{1}{4}$ of the assay-value of the base bullion, rest Fe and S) is roasted and resmelted, when part of the argentiferous lead is recovered as base bullion, while the rest remains with the copper, which becomes concentrated in a coppermatte (60 per cent. copper) to be worked up by separate processes (see COPPER). The slag is a waste product, and the flue-dust, collected by special devices in dust-chambers, is briquetted by machinery, with lime as a bond, and then resmelted with the ore-charge. The yield in lead is over 90 per cent., in silver over 97 per cent., and in gold 100 per cent. The cost of smelting a ton of ore in Colorado in a single furnace, 42 by 120 inches at the tuyères, is about \$3.

The lead produced in the reverberatory furnace and the ore-hearth is of a higher grade than that produced in the blast-furnace, as the ores treated are purer and richer, and the reducing action is less powerful.

Refining.

The following analysis of blast-furnace lead of Freiberg, Saxony, is from an exceptionally impure lead:—Pb 95·088, Ag 0·470, Bi 0·019, Cu 0·225, As 1·826, Sb 0·958, Sn 1·354, Fe 0·007, Zn 0·002, S 0·051. Of the impurities, most of the copper, nickel and copper, considerable arsenic, some antimony, and small amounts of silver, are removed by liquation. The lead is melted down slowly, when the impurities separate in the form of a scum (dross), which is easily removed. The purification by liquation is assisted by poling the lead when it is below redness. A stick of green wood is forced into it, and the vapours and gases set free stir it up and expose new surfaces to the air, which at this temperature has only a mildly oxidizing effect. The pole, the use of which is awkward, has been replaced by dry steam, which has a similar effect. In order to remove tin, arsenic, and antimony, the lead has to be brought up to a bright-red heat, when the air has a strongly oxidizing effect. Tin is removed mainly as a powdery mixture of stannate of lead and lead oxide, arsenic and antimony as a slagged mixture of arsenate and antimonate of lead and lead oxide. They are readily withdrawn from the surface of the lead, and are worked up into antimony (arsenic)—tin-lead and antimony-lead alloys. Liquation, if not followed by poling, is carried on as a rule in a reverberatory furnace with an oblong, slightly trough-shaped inclined hearth; if the lead is to be poled it is usually melted down in a cast-iron kettle. If the lead is to be liquated and then brought to a bright-red heat, both operations, for convenience' sake, are carried on in the same reverberatory furnace. This has an oblong, dish-shaped hearth of acid or basic fire-brick built into a wrought-iron pan, which rests on transverse rails supported by longitudinal walls. The lead is melted down at a low temperature and drossed. The temperature is then raised, and the scum which forms on the surface is withdrawn until pure litharge forms, which only takes place after all the tin, arsenic, and antimony have been eliminated.

Silver is extracted from lead by means of the process of cupellation (see *Ency. Brit.* vol. xiv. p. 376).

Desilverizing.

Formerly all argentiferous lead had to be cupelled, and the resulting litharge then reduced to metallic lead. In 1833 Pattinson invented his process

(*ibid.* p. 377) by means of which practically all the silver is concentrated in 13 per cent. of the original lead to be cupelled, while the rest becomes market lead. In 1842 Karsten (*loc. cit.*) discovered that lead could be desilverized by means of zinc. His invention, however, only took practical form in 1850–52 through the researches of Parkes, who showed how the zinc-silver-lead alloy formed could be worked, and the desilverized lead freed from the zinc it had taken up. In the Parkes process only 5 per cent. of the original lead need be cupelled. Thus, while cupellation still furnishes the only means for the final separation of lead and silver, it has become an auxiliary process to the two methods of concentration given. Of these the Pattinson process has become subordinate to the Parkes process, as it is more expensive and leaves more silver and impurities in the market lead. It holds its own, how-

ever, when base bullion contains bismuth in appreciable amounts, as in the Pattinson process bismuth follows the lead to be cupelled, while in the Parkes process it remains with the desilverized lead which goes to market, and lead of commerce should contain little bismuth. At Freiberg, Saxony, the two processes have been combined. The base bullion is imperfectly Pattinsonized, giving lead rich in silver and bismuth, which is cupelled, and lead low in silver, and especially so in bismuth, which is further desilverized by the Parkes process.

The effect of the two processes on the purity of the market lead is clearly shown by the two following analyses by Hampe, which represent lead from Lautenthal in the Harz Mountains, where the Parkes process replaced that of Pattinson, the ores and smelting process remaining practically the same:—

Process.	Pb.	Cu.	Sb.	As.	Bi.	Ag.	Fe.	Zn.	Ni.
Pattinson	99.966200	0.015000	1.010000	none	0.000600	0.002200	0.004000	0.001000	1.001000
Parkes	99.983139	0.001413	0.005698	none	0.005487	0.000460	0.002289	0.000834	0.000680

The reverberatory furnace commonly used for cupelling goes by the name of the English cupelling furnace. It is

oblong, and has a fixed roof and a movable iron **Cupelling-** hearth (test). Formerly the test was lined with bone-ash; at present the hearth-material is a mixture of crushed limestone and clay (3:1), or Portland cement, either alone or mixed with crushed fire-brick; in a few instances the lining has been made of burnt magnesite. In the beginning of the operation enough argentiferous lead is charged to fill the cavity of the test. After it has been melted down and brought to a red heat, the blast, admitted at the back, oxidizes the lead and drives the litharge formed towards the front, where it is run off. At the same time small bars of argentiferous lead, inserted at the back, are slowly pushed forward, so that in melting down they may replace the oxidized lead. Thus the level of the lead is kept approximately constant, and the silver becomes concentrated in the lead. In large works the silver-lead alloy is removed when it contains 60–80 per cent. silver, and the cupellation of the rich bullion from several concentration furnaces is finished in a second furnace. At the same time the silver is brought to the required degree of fineness, usually by the use of nitre. In small works the cupellation is finished in one furnace, and the resulting low-grade silver fined in a plumbago crucible, either by overheating in the presence of air, or by the addition of silver sulphate to the melted silver, when air or sulphur trioxide and oxygen oxidize the impurities. The lead charged contains about 1.5 per cent. lead if it comes from a Pattinson plant, from 5–10 per cent. if from a Parkes plant. In a test 7 feet by 4 feet 10 inches, and 4 inches deep, about 6 tons of lead are cupelled in twenty-four hours. A furnace is served by three men, working in eight-hours shifts, and requires about 2 tons of coal, which corresponds to about 110 gallons reduced oil, air being used as atomizer. The loss in lead is about 5 per cent. The latest cupelling furnaces have the general form of a reverberatory copper-smelting furnace. The working door through which the litharge is run off lies under the flue which carries off the products of combustion and the lead fumes, the lead is charged, and the blast is admitted near the fire-bridge.

In the *Pattinson* process the argentiferous lead is melted down in the central cast-iron kettle of a series 8–15, placed one next to the other, each having a capacity of 9–15 tons and a separate fireplace. **Pattinson process.** The crystals of impoverished lead which fall to the bottom, upon coaling the charge, are taken out with a skimmer and discharged into the neighbouring kettle (say to the right) until about two-thirds of the

original charge has been removed; then the liquid enriched lead is ladled into the kettle on the opposite side. To the kettle, two-thirds full of crystals of lead, is now added lead of the same tenor in silver, the whole is liquefied, and the cooling, crystallizing, skimming, and ladling are repeated. The same is done with the kettle one-third filled with liquid lead, and so on until the first kettle contains market lead, the last cupelling lead. The intervening kettles contain leads with silver contents ranging from above market to below cupelling lead. The original Pattinson process has been in many cases replaced by the Luce-Rozan process (1870), which does away with arduous labour and attains a more satisfactory crystallization. The plant consists of two tilting oval metal pans (capacity 7 tons), one cylindrical crystallizing pot (capacity 22 tons), with two discharging spouts and one steam inlet opening, two lead moulds (capacity 3½ tons), and a steam crane. Pans and pot are heated from separate fireplaces. Supposing the pot to be filled with melted lead to be treated, the fire is withdrawn beneath and steam introduced. This cools and stirs the lead when crystals begin to form. As soon as two-thirds of the lead has separated out in the form of crystals, the steam is shut off and the liquid lead drained off through the two spouts into the moulds. The fire underneath the pot is again started, the crystals are liquefied, and one of the two pans, filled with melted lead, is tilted by means of the crane and its contents poured into the pot. In the meantime the lead in the moulds, which has solidified, is removed with the crane and stacked to one side, until its turn comes to be raised and charged into one of the pans. The crystallization proper lasts one hour, the working of a charge four hours, six charges being run in twenty-four hours.

It is absolutely necessary for the success of the *Parkes* process that the zinc and lead should contain only a small amount of impurity. The spelter used must therefore be of a good grade, and the lead is usually first refined in a reverberatory furnace **Parkes process.** (the softening furnace) as described above. The capacity of the furnace must be 10 per cent. greater than that of the kettle into which the softened lead is tapped, as the dross and skimmings formed amount to about 10 per cent. of the weight of the lead charged. The kettle is spherical, and is suspended over a fireplace by a broad rim resting on a wall; it is usually of cast-iron. Most kettles at present hold 30 tons of lead; some, however, have double that capacity. When zinc is placed on the lead (heated to above the melting-point of zinc), liquefied, and brought into intimate contact with the lead

by stirring, gold, copper, silver, and lead will combine with the zinc in the order given. By beginning with only a small amount of zinc, all the gold and copper and some silver and lead will be alloyed with the zinc to a so-called gold—or copper—crust, and the residual lead saturated with zinc. By removing from the surface of the lead this first crust and working it up separately (liquating, retorting, and cupelling), doré silver is obtained. By the second addition of zinc most of the silver will be collected in a saturated zinc-silver-lead crust, which, when worked up, gives fine silver. A third addition becomes necessary to remove the rest of the silver, when the lead will assay only 0.1 ounce silver per ton. As this complete desilverization is only possible by the use of an excess of zinc, the unsaturated zinc-silver-lead alloy is put aside to form part of the second zincking of the next following charge. In skimming the crust from the surface of the lead some unalloyed lead is also drawn off, and has to be separated by an additional operation (liquation), as, running lower in silver than the crust, it would otherwise reduce its silver content and increase the amount of lead to be cupelled. A zincking takes 5–6 hours; 1.5–2.5 per cent. zinc is required for desilverizing. The liquated zinc-silver-lead crust contains 5–10 per cent. silver, 30–40 per cent. zinc, and 65–50 per cent. lead. Before it can be cupelled it has to be freed from most of the zinc, which is accomplished by distilling in a retort made of a mixture similar to that of the plumbago crucible. The retort is pear-shaped, and holds 1000–1500 lb of charge, consisting of liquated crust mixed with 1–3 per cent. of charcoal. The condenser commonly used is an old retort. The distillation of 1000 lb charge lasts 5–6 hours, requires 500–600 lb coke or 30± gallons reduced oil, and yields about 10 per cent. metallic zinc and 1 per cent. blue powder—a mixture of finely-divided metallic zinc and zinc oxide. About 60 per cent. of the zinc used in desilverizing is recovered in a form to be used again. One man serves 2–4 retorts. The desilverized lead, which retains 0.6–0.7 per cent. zinc, has to be refined before it is suited for industrial use. The operation is carried on in a reverberatory furnace or in a kettle. In the reverberatory furnace, similar to the one used in softening, the lead is brought to a bright-red heat and air allowed to have free access. The zinc and some lead are oxidized; part of the zinc passes off with the fumes, part is dissolved by the litharge, forming a melted mixture which is skimmed off and reduced in a blast-furnace or a reverberatory smelting furnace. In the kettle covered with a hood the zinc is oxidized by means of dry steam, and incidentally some lead by the air which cannot be completely excluded. A yellowish powdery mixture of zinc and lead oxides collects on the lead; it is skimmed off and sold as paint. From the reverberatory furnace or the kettle the refined lead is siphoned off into a storage (market) kettle after it has cooled somewhat, and from this it is siphoned off into moulds placed in a semicircle on the floor. In the process the yield in metal, based upon the charge in the kettle, is lead 99 per cent., silver 100+ per cent., gold 98–100 per cent. The plus-silver is due to the fact that in assaying the base bullion by cupellation, the silver lost by volatilization and cupel-absorption is neglected. In the United States the cost of desilverizing a ton base bullion is about \$6.

STATISTICS.—The world's production of lead in 1899 was, according to *The Mineral Industry* (1900, p. 431), 803,273 metric tons, viz.: Austria, 9736; Belgium, 15,700; Canada, 9917; Chile, 171; France, 15,981; Germany, 129,225; Greece, 19,059; Hungary, 2166; Italy, 20,543; Japan, 1989; Mexico, 84,656; New South Wales, 70,000; Russia, 250; Spain, 184,007; Sweden, 1606; United Kingdom, 41,500; United States, 196,938.

(H. O. H.)

Lead Poisoning.—Lead poisoning has become important from the administrative point of view. Its occurrence among persons working in various industries has for some years engaged the attention of the Factory Department of the British Home Office, and from time to time "special rules" have been drawn up in the United Kingdom for workshops and workpeople, with the object of minimizing or preventing it. Previous to 1895, when an Act was passed for the compulsory notification of all cases, the extent of the evil was not at all accurately known; it could only be calculated from hospital records and from the Registrar-General's mortality returns. The number of deaths directly ascribed to lead poisoning, or "plumbism," is a very imperfect measure of its influence on health, as it acts also indirectly by causing or promoting organic disease, particularly of the nervous and urinary systems. The Supplement to the Registrar-General's 55th annual report contains the following table, showing the comparative mortality for 1890–91–92 in various industries:—

	Plumbism.	Diseases of Urinary System.	Diseases of Nervous System.	Gout.	Phthisis.	Circulatory Diseases.	Respiratory Diseases.
Lead-worker	211	161	232	...	148	272	397
File-maker	75	104	212	4	402	204	423
Plumber	21	81	131	13	165	123	218
Painter and Glazier	18	83	132	9	232	147	225
Potter	17	63	123	1	333	227	668
Glass-maker	12	63	155	9	295	157	445
Copper-worker	8	60	85	...	294	186	406
Coachmaker	7	68	105	7	189	134	250
Gasfitter, Locksmith	6	50	108	5	223	104	205
Lead-miner	5	41	62	...	380	142	325
Printer	3	52	98	4	326	133	214
Cutler	3	56	91	...	382	167	518
Wool manufacturer	3	45	100	1	191	131	256

The table shows the association of plumbism with diseases of the urinary and nervous systems, and to a less degree with those of the circulatory system. Phthisis and respiratory diseases, on the other hand, are not so associated. They are highest among potters, cutlers, and file-makers, and are undoubtedly due to the inhalation of dust.

The symptoms of lead poisoning vary within very wide limits, from colic and constipation up to total blindness, paralysis, convulsions, and death. They are thus described by Dr Arlidge (*Diseases of Occupations*):—

The poison finds its way gradually into the whole mass of the circulating blood, and exerts its effects mainly on the nervous system, paralysing nerve-force, and with it muscular power. Its victims become of a sallow-waxy hue; and the functions of the stomach and bowels are deranged, appetite fails, and painful colic with constipation supervenes. The loss of power is generally shown first in the fingers, hands, and wrists, and the condition known as "wrist-drop" soon follows, rendering the victim useless for work. The palsy will extend to the shoulders, and after no long time to the legs also. Other organs frequently involved are the kidneys, the tissue of which becomes permanently damaged; whilst the sight is weakened or even lost.

As a rule the poisoning is gradually established by accumulation, and persons may have lead in the system for years before any symptoms manifest themselves. Dr M'Aldowie, senior physician to the North Staffordshire Infirmary, states that "in the pottery trade lead is very slow in producing serious effects compared with certain other industries." In his experience the average period of working in lead before serious lesions manifest themselves is 18 years for females and 22½ years for males.

But some individuals fall victims to the worst forms of plumbism after a few months' or even weeks' exposure to the danger. Young persons are more readily affected than those of mature age, and women more than men. In addition to age and sex influence, there seems to be an element of personal susceptibility, the nature of which is not understood. Some persons "work in the lead" for twenty, forty, or fifty years without the slightest ill effects; others succumb rapidly and persistently to the poison, having repeated attacks whenever they are brought into contact with it. This is ascribed to "idiosyncrasy"—a long word of little meaning. Possibly the difference is due to the general state of health; robust persons resist the poison successfully, those with impoverished blood and feeble constitution are mastered by it. The explanation is vague, but not without meaning if lead acts, as it is supposed to do, by destroying the red corpuscles in the blood. Robust persons, feeding heartily and keeping up an ample supply of red corpuscles, would naturally resist it better than the ill-nourished, weakly, and anæmic. The great susceptibility of pregnant women, whose nutritive functions are placed under a double strain, bears out this view, which points to the importance of good nutrition. But the different effects of contact with lead on different individuals have another explanation, which is probably more important than any factor of susceptibility—namely, the habits of the workpeople. Lead enters the body chiefly through the nose and mouth, being inspired in the form of dust or swallowed with food eaten with unwashed hands. It is very apt to get under the nails, and is possibly absorbed in this way through the skin. Personal care and cleanliness are therefore of the greatest importance. The dust may be minimized by mechanical appliances and ventilation, but so long as lead particles get on the hands and person they will be liable to be swallowed by careless workpeople. A factory surgeon of great experience in the Potteries reckons that seventeen out of twenty cases of lead poisoning in the china and earthenware industry are due to carelessness (*The Times*, 8th October 1898). This is one of the largest and most important industries affected by lead, and the one to which most attention has been drawn, mainly because of a somewhat sensational agitation in 1898. It was based on the occurrence of recent cases of a very severe and rapid character among women and girls employed in certain processes of manufacture in the Potteries district. It has had the effect of stimulating reforms in the conduct of the industry, and, incidentally, of promoting a manufacturing development of much commercial interest. The health of workpeople in the Potteries had already been the subject of a special inquiry by a scientific committee on behalf of the Home Office in 1893. The committee stated that "the general truth that the potteries occupation is one fraught with injury to health and life is beyond dispute," and that "the ill effects of the trade are referable to two chief causes—namely, dust and the poison of lead." Of these the inhalation of clay and flint dust is the more important. It leads to bronchitis, phthisis, and pneumonia, which are by far the most prevalent disorders among potters, and responsible for 70 per cent. of the mortality. That from lead the committee did not attempt to estimate, but they found that plumbism was less prevalent than in past times, and expressed the opinion "that a large part of the mortality from lead poisoning is avoidable; although it must always be borne in mind that no arrangements or rules, with regard to the work itself, can entirely obviate the effects of the poison to which workers are exposed, because so much depends upon the individual and the observance of personal care and cleanliness."

They recommended the adoption of certain special rules in the workshops, with the objects of protecting young persons from the lead, of minimizing the evils of dust, and of promoting cleanliness, particularly in regard to meals. Some of these recommendations were adopted and applied with good results. With regard to the suggestion that "only leadless glazes should be used on earthenware," they did not "see any immediate prospect of such glazes becoming universally applicable to pottery manufacture," and therefore turned their attention to the question of "fritting" the lead. It may be explained here that lead is used in china and earthenware to give the external glaze which renders the naturally porous ware watertight. Both "white" and "red" lead are used. The lead is added to other ingredients, which have been "fritted" or fused together, and then ground very fine in water, making a thick creamy liquid into which the articles are dipped. After dipping the glaze dries quickly, and on being "fired" in the kiln it becomes fused by the heat into the familiar glassy surface. In the manufacture of ware with enamelled colours, glaze is mixed with the pigment to form a flux, and such colours are used either moist or in the form of a dry powder, according to the style of goods. "Fritting" the lead means mixing it with the other ingredients of the glaze beforehand and fusing them all together under great heat into a kind of rough glass, which is then ground to make the glaze. Treated in this way the lead combines with the other ingredients and becomes less soluble, and therefore less dangerous, than when added afterwards in the raw state. The committee thought it "reasonable to suppose that the fritting of lead might ultimately be found universally practicable," but declared that though fritting "no doubt diminishes the danger of lead poisoning," they "could not regard all fritts as equally innocuous."

In the annual report of the chief inspector of factories for 1897, published in 1898, it was stated that there had been "material improvement in dust conditions" in the potting industry, but "of lead poisoning unfortunately the same could not be said, the number of grave cases reported, and particularly cases of blindness, having ominously increased of late." This appears to have been largely due to the erroneous inclusion among potting processes of "litho-transfer making," a new colour industry in which girls are employed. New special rules were therefore imposed, prohibiting the employment of persons under fifteen years of age in the dangerous processes, ordering a monthly examination of all women and young persons working in lead by the certifying surgeon, with power to suspend those showing symptoms of poisoning, and providing for the more effectual removal of dust and the better enforcement of cleanliness. At the same time a scientific inquiry was ordered into the practicability of dispensing with lead in glazes or of substituting fritted compounds for the raw carbonate. The scientific experts reported in 1899, recommending that the use of raw lead should be absolutely prohibited, and expressing the opinion that the greater amount of earthenware could be successfully glazed without any lead at all. These views were in advance of the opinions held by practical potters, and met with a good deal of opposition. By the enterprise of certain manufacturers, who had been working at the problem for years, considerable progress had been made in diminishing the use of raw lead and towards the discovery of satisfactory leadless glazes, and the movement had been much stimulated by the public agitation previously mentioned; but it is a long step from individual experiments to the wholesale compulsory revolution of the processes of manufacture in so large and varied an industry, and in the face of foreign competitors hampered by no

such regulations. The materials used by each manufacturer have been arrived at by a long process of experience, and they are such as to suit the particular goods he supplies for his particular market. He cannot change them suddenly without endangering the quality, and consequently risking the loss of the market. Nor does the experience of other manufacturers afford him much practical assistance, for a glaze which has been proved satisfactory for one class of goods may be quite unsuitable to another. And the varieties are endless, on account of differences in the composition of the ware and in firing. It is therefore difficult to apply a uniform rule without jeopardizing the prosperity of the industry, which supports a population of 250,000 in the Potteries alone. However, the bulk of the manufacturers agreed to give up the use of raw lead, and to fritt all their glazes in future, time being allowed to effect the change of process; but they declined to be bound to any particular composition of glaze for the reasons indicated.

In 1901 the Home Office brought forward a new set of special rules. Most of these were framed to strengthen the provisions for securing cleanliness, removing dust, &c., and were accepted with a few modifications. Strong objection, however, was raised to three of the proposed rules—namely, No. 1, which prohibited the use of unfritted lead; No. 2, which provided that “no glaze shall be used which yields to a dilute solution of hydrochloric acid more than 2 per cent. of its dry weight of a soluble lead compound calculated as lead monoxide”; and No. 6, which extended the monthly examination of women and young persons working in lead processes, with power of suspension, to men. The manufacturers objected to No. 1 and No. 2 as impracticable, and the workmen to No. 6 as unnecessary and a vexatious interference with their liberty. Arbitration between the Home Office and the objectors took place under the Factory Acts in November 1901. The arbitrator, Lord James of Hereford, after hearing the case for the Home Office, ruled that the questions in dispute should be left open for eighteen months and come up for reconsideration at the end of that time.

The arbitrator was influenced in this decision by the great diminution of lead poisoning in the industry. The number of cases notified in 1899 was 249; 1900, 200; 1901, 106. This diminution is attributed mainly to the monthly examination and the removal of dust by ventilating fans. The number of cases of lead poisoning notified in the various industries after the Act of 1895 was given in the annual report of the Chief Inspector of Factories for 1899 as follows:—

	1896.	1897.	1898.	1899.
China and Earthenware	432	446	457	249
White Lead	239	370	332	399
Smelting	56	102	82	61
Tinning and Enamelling	35	36	24	24
File-making	20	39	46	41
Paints and Colours	93	35	59	75
Glass	14	23	19	8
Coachmaking	15	18	45	65
Electric accumulator works	11	32
Litho-transfer works (only classified in 1899)	11
Other Industries	126	145	203	293
Total	1030	1214	1278	1258

These figures include all degrees of severity. In the return for 1899 they were classified, with the following result:—

	Severe.	Moderate.	Slight.	Not stated.
	Per cent.	Per cent.	Per cent.	Per cent.
Males	32·0	13·6	50·8	4·5
Females	21·0	17·6	54·5	6·3

The proportions of each class vary greatly in different industries. Those with the largest proportion of severe cases were file-

cutting with 53·9 per cent., certain painting trades with 51·1 per cent., sheet lead with 44·3 per cent., coach-painting with 43·1 per cent., paints and colours with 42·5 per cent. In the potting industry the majority of the cases were slight—namely, males 57·1 per cent., females 60·4 per cent. The percentage of severe cases was—males 29·4, females 19·8. In the white lead industry the proportions are still more favourable, the percentage being—slight, males 68·3, females 77·3; severe, males 23·2, females 13·6. In both these industries there is periodical examination of the workpeople. Out of the whole number of cases returned, 30·4 per cent. of the males and 21·5 per cent. of the females were classed as secondary attacks or chronic cases. In 1900 the percentages in the potting trade were—severe, males 18·5, females 23·8; slight, males 57·6, females 43·8. In 1901 they were—severe, males 33·8, females 20·4; slight, males 45·6, females 51·0.

The increase shown above in the annual returns since 1896 is largely due to a corresponding increase in the number of persons employed. For 1899 there was a very notable decrease—more than 45 per cent.—in the number of cases in the potting industry. It was partly due to the elimination of cases returned twice over, which unduly inflated the returns in previous years, and partly to the operation of the special rules established in 1898. The effect of the monthly examination of women was clearly shown by the fact that the female cases, which had previously exceeded the male, fell below them in 1899. The average number of examinations every month was 223, and of suspensions 10. In 1900 the average monthly number of suspensions was 8, and in 1901 it was 7.

The following notes refer to the more important of the other industries concerned. *White Lead.*—The increase of cases shown in 1899 was largely due to the engagement at one factory of a number of Italians previously employed in smelting works, and already charged with lead, in whom the white lead dust evoked active symptoms. New special rules were adopted in 1899 for the more efficient prevention of dust, promotion of cleanliness, and weekly examination of workers. The introduction of a new method of manufacture, called the Bischof process, whereby dust is avoided, promises to effect a large diminution of danger. *File-cutting.*—This is the most injurious of all the lead industries, and causes far more cases of paralysis than any other. The great majority of the cases are returned from Sheffield, where 2990 men are employed as hand cutters of files. *Smelting.*—In this industry men are exposed to the fumes of lead and other metals, as well as to dust, sulphur, dioxide gas, and great heat. It is under special rules, but the physical difficulty of protecting workmen from fumes has not been surmounted. *Printing.*—The number of cases is very small, and far less than in Germany. Eating with unwashed hands is the chief cause. *Tinning and Enamelling.*—Carbonate of lead in powder is used in the best quality of enamelling, and the process necessarily entails much scattering of the dust. The industry is under special rules. Fritted lead has not been introduced in place of the raw carbonate. *Paints and Colours.*—The danger is the inhalation of dust, which is to some extent met by the provision of ventilating fans. It is a large industry, employing, in 1897, 6019 persons in 354 factories. *Coach-painting.*—The percentage of severe and chronic cases is exceedingly high. The danger lies largely in the process of sand-papering a coat of paint to obtain a surface for another coat. The apparent increase in the number of cases is explained by the fact that notification was not at first understood, particularly in some large railway carriage works. *House-painters and Plumbers* do not come under the Factory Acts, but a considerable number of cases are notified. There is no doubt that a great deal of serious lead poisoning occurs among house-painters, but unless it is contracted in factory or workshop, as in grinding or mixing paints, the factory inspectors cannot interfere.

The regulations against industrial lead poisoning in the United Kingdom appear to be very much more complete and stringent than in any Continental country or in the United States.

Leadville, a city of Colorado, U.S.A., capital of Lake county, on the east side of the Arkansas valley, near the head of the river, at an altitude of 10,000 feet. It is the largest city at such an elevation in the United States, and probably in the world. It is situated on a gravel terrace, sloping westwards to the river, just north of California Gulch. It is regularly laid out, divided into three wards, and has a water-supply brought from the Arkansas river by gravity. It is entered by three railways, the Colorado Midland, the Denver and Rio Grande, and the Colorado Southern, which connect it with Denver, Colorado Springs, Pueblo, and Salt Lake. In 1859 gold in placers was discovered in California Gulch, just south of

the present city, and in the succeeding five years from \$12,000,000, to \$15,000,000 worth was taken from it. Indeed, in the heyday of its prosperity California Gulch was as busy and populous as was Leadville twenty years later; but on the exhaustion of its placers the region was almost deserted, 100 or 200 inhabitants, constituting the town of Oro, being all that were left. The accidental discovery here in 1878 of lead carbonates containing silver in vast quantities caused a mining excitement over the whole country, and a second stampede to California Gulch ensued, paralleled only by the first. Two years later, in 1880, Leadville had a population of 14,820. Many very rich mines were discovered and worked, and the district as a whole is still as productive as ever. The ore is mainly a carbonate of lead, but with many accessory metals and combinations. It lies in beds or sheets, between old rock strata much broken by faults and dislocations. The yield of the mines is about \$13,000,000 in silver annually, besides a vast amount of lead and other metals. Most of the ore is smelted at Leadville, and the matte transported east for refining. Population (1890), 10,384; (1900), 12,455, of whom 3802 were foreign-born.

Leamington, LEAMINGTON PRIORS, or ROYAL LEAMINGTON SPA, a municipal borough and inland watering-place of Warwickshire, England, on the Leam, 98 miles north-west of London by rail. In 1885 the boroughs of Warwick and Leamington were united in one constituency, returning one member to Parliament. The parish church of All Saints is mostly modern. Recent erections are a theatre and a town hall, containing a free library and a school of art. There is a municipal technical school. There are iron-foundries and brickworks. Area of civil parish, 1595 acres. Population (1891), 26,930; (1901), 26,888.

Lear, Edward (1812-1888), English artist and humorist, was born in London on 12th May 1812. His earliest drawings were ornithological. When he was twenty years old he published a brilliantly coloured selection of the rarer *Psittacidae*. Its power attracted the attention of the 13th earl of Derby, who employed Lear to draw his Knowsley menagerie. He became a permanent favourite with the Stanley family; and Edward, 15th earl, was the child for whose amusement the first *Book of Nonsense* was composed. From birds Lear turned to landscape, his earlier efforts in which recall the manner of J. D. Harding; but he quickly acquired a more individual style. About 1837 he set up a studio at Rome, where he lived for ten years, with summer tours in Italy and Sicily, and occasional visits to England. During this period he began to publish his *Illustrated Journals of a Landscape Painter*: charmingly written reminiscences of wandering, which ultimately embraced Calabria, the Abruzzi, Albania, Corsica, &c. His wider flights date from 1848-49, when he explored Greece, Constantinople, the Ionian Islands, the wildest recesses of Albania, Lower Egypt, and the desert of Mount Sinai. He returned to London, but the climate did not suit him. In 1854-55 he wintered on the Nile, and migrated successively to Corfu, Malta, and Rome, till he finally settled on the Riviera, building himself a villa at San Remo, where he closed a career of untiring industry. From Corfu Lear visited Mount Athos, Syria, Palestine, and Petra; and when over sixty, by the generous assistance of his intimate friend Lord Northbrook, then Governor-General, he saw the cities and scenery of greatest interest within a large area of India. From first to last he was, in whatever circumstances of difficulty or ill-health, an indomitable traveller. Before visiting new lands he studied their geography and literature, and then went straight for the mark; and wherever he went he drew most inde-

fatigably and most accurately. His sketches are not only the basis of more finished works, but an exhaustive record in themselves. Some defect of technique or eyesight occasionally left his larger oil painting, though nobly conceived, crude or deficient in harmony; but his smaller pictures and more elaborate sketches abound in beauty, delicacy, and truth. Lear modestly called himself a topographical artist; but he included in the term the perfect rendering of all characteristic graces of form, colour, and atmosphere. The last task he set himself was to prepare for popular circulation a set of some 200 drawings, illustrating from his travels the scenic touches of Tennyson's poetry; but he did not live to complete the scheme, dying at San Remo on 30th January 1888. Until sobered by age, his conversation was brimful of humorous fun. The paradoxical originality and ostentatiously uneducated draughtsmanship of his numerous nonsense books appealed to a wider public, and won him a more universal fame than his serious work. He had a true artist's sympathy with art under all forms, and might have become a skilled musician had he not been a painter. Swainson, the naturalist, praised young Lear's great red and yellow macaw as "equalling any figure ever painted by Audubon in grace of design, perspective, and anatomical accuracy." Murchison, examining his sketches, complimented them as rigorously embodying geological truth. Tennyson's lines "To E. L. on his travels in Greece," mark the poet's genuine admiration of a cognate spirit in classical art. Ruskin placed the *Book of Nonsense* first in the list of a hundred delectable volumes of contemporary literature, a judgment endorsed by English-speaking children all over the world. (F. L*.)

Leavenworth, a city of Kansas, U.S.A., capital of Leavenworth county, on the west bank of the Missouri river, at an altitude of 765 feet. It is laid out regularly in the bottom-lands of the river, and is divided into six wards. It is the fourth city of the state in population, and one of the most important railway centres west of the Mississippi river, no fewer than nine railways entering it. These, with the steamboats on the river, give the city a large trade. Its manufactures are also prominent, and are varied in character. Two miles north of the city is Fort Leavenworth, a United States military post, associated with which is a military prison and a well-known military school. Population (1890), 19,768; (1900), 20,735, of whom 3402 were foreign-born and 2925 were negroes.

Lebanon.—Since 1875 great progress has been made in that part of the Lebanon which was made an independent sanjak under a Christian governor in 1861. The population has almost doubled, villages have largely increased in size, nearly all available ground has been brought under cultivation, roads have been made, the Beirut-Damascus railway, opened in 1895, crosses the district, and a short line runs northwards along the coast from Beirut to Mameltein. The steady growth of prosperity has been accompanied by a rapid increase of population, and this of late years has become larger than the land can support. The result has been emigration, which the Porte has vainly attempted to stop, of Druses to the Haurán, and of Christians to the United States and Egypt. It has been estimated that the annual number of emigrants, chiefly from the sanjak, is 10,000, and that of these one-fifth settle abroad. The others return to their homes after having earned enough for their simple requirements. Since the British occupation of Egypt the emigration to that country has assumed large proportions. There the Syrians fill many of the minor posts in the ministries and local governments, are employed as interpreters to the army, and work on the staffs of the Arabic newspapers published

at Cairo and Alexandria. Population, about 400,000—Christians (including 230,000 Maronites and 54,000 Orthodox Greeks), 320,000; Druses, 50,000; Moslems, Sunni, and Metawile, 30,000.

(c. w. w.)

Lebanon, a city of Pennsylvania, U.S.A., capital of Lebanon county, on Swatara Creek, in Cumberland Valley, south of Blue Mountain, at an altitude of 464 feet. Its site is rolling and its plan regular. It has three railways, the Philadelphia and Reading, the Cornwall, and the Cornwall and Lebanon. It is an iron manufacturing city, containing blast-furnaces, rolling-mills, and foundries. Population (1890), 14,664; (1900), 17,628, of whom 618 were foreign-born.

Lebœuf, Edmond (1809–1888), French soldier, was born at Paris on the 5th of November 1809, and received his military training at the Artillery School at Metz, becoming colonel in 1852. He commanded the artillery of the 1st French corps at the siege of Sebastopol, and was promoted in 1855 to the rank of general, and in 1857 to that of general of division. In the Franco-Italian war of 1859 he commanded the artillery, and by his action at Solferino materially assisted in the victory. In September 1866 he was despatched to Venetia to hand over that province, which had been ceded by Austria, to Victor Emmanuel. In 1869, on the death of Marshal Niel, General Lebœuf became Minister of War, and earned public approbation by his vigorous reorganization of the War Office and the civil departments of the service. In the spring of the fateful year 1870 he received the field-marshal's baton. On the declaration of war with Germany Marshal Lebœuf delivered himself in the Corps Législatif of the historical saying, "So ready are we, that if the war lasts two years, not a gaiter button would be found wanting." He took part in the campaign as major-general of the army of the Rhine, but after the reverses at Wissembourg and Woerth was deprived of this command and placed at the head of the 3rd corps, distinguishing himself by his personal bravery at the battles of Noiseville and St Privat. Shut up with Bazaine in Metz, on its fall he was confined as a prisoner in Germany. On the conclusion of peace he returned to France and gave evidence before the commission of inquiry into the surrender of that stronghold, when he strongly denounced Bazaine. After this he retired into private life to the Château du Moncel near Argentan, where he died on the 7th of June 1888.

Le Caron, Henri (whose real name was THOMAS MILLER BEACH) (1841–1894), British secret service agent, was born at Colchester, 26th September 1841. He was of an adventurous character, and when nineteen years old went to Paris, where he found employment in business connected with America. Infected with the excitement of the American Civil War, he crossed the Atlantic in 1861 and enlisted in the Northern army, taking the name of Henri Le Caron when he did so. In 1864 he married a young lady who had helped him to escape from some Confederate marauders; and by the end of the war he rose to be major. In 1865, through a companion in arms named O'Neill, he was brought into contact with Fenianism, and having learnt of the Fenian plot against Canada, he mentioned the designs when writing home to his father. Mr Beach told his local M.P., who in turn told the Home Secretary, and the latter asked Mr Beach to arrange for further information. Le Caron, inspired (as all the evidence shows) by genuinely patriotic feeling, from that time till 1889 acted for the British Government as a paid

military spy. He was a proficient in medicine, among other qualifications for this post, and he remained for years on intimate terms with the most extreme men in the Fenian organization under all its forms. His services enabled the British Government to take measures which led to the fiasco of the Canadian invasion of 1870 and Riel's surrender in 1871, and he supplied full details concerning the various Irish-American associations, in which he himself was a prominent member. He was in the secrets of the "new departure" in 1879–81, and in the latter year had an interview with Parnell at the House of Commons, in the course of which the Irish leader spoke sympathetically of an armed revolution in Ireland. For twenty-five years he lived at Detroit and other places in America, paying occasional visits to Europe, and all the time carrying his life in his hand. The Parnell Commission of 1889 put an end to this. Le Caron was subpoenaed by *The Times*, and in the witness-box the whole story came out, all the efforts of Sir Charles Russell in cross-examination failing to shake his testimony or to impair the impression of iron tenacity and absolute truthfulness which his bearing conveyed. His career, however, for good or evil, was at an end. He published the story of his life, *Twenty-five Years in the Secret Service*, and it had an immense circulation. But he had to be constantly guarded, his acquaintances were hampered from seeing him, and he was the victim of a painful disease, of which he died on 1st April 1894. The report of the Parnell Commission is his monument.

Lecce, a town, episcopal see, and capital of the province of Lecce, Apulia, Italy, 24 miles south-east of Brindisi by rail. In the prefecture there are collections of antique vases, coins, inscriptions, &c. In 1889 a monument of Victor Emmanuel II. by Maccagni was unveiled. The staple industry is the manufacture of tobacco. In 1900 Lecce was connected by electric tramway with San Cataldo, on the coast 6 miles to the east, where a small fishing port has been made. Population (1881), 22,051; (1901), 32,485.

Lecco, a town of the province of Como, Lombardy, Italy, on the east side of the south-east extension of Lake Como, and 27 miles north by east of Milan by rail. There are statues to Garibaldi (1881) and Manzoni (1891), whose house is called Galeotto, not Caleotto. Besides the silk, cotton, and iron industries, there are copper works, and factories for wax candles and tin boxes; also a school of the industrial arts and sciences. Population (1881), 7775; (1897), 6100.

Lech, a river of Bavaria, rising in the Vorarlberg Alps, at an altitude of 6120 feet. It winds out of the gloomy limestone mountains in a north-north-easterly direction, and enters the plains at Füssen (2580 feet), where it forms rapids and a fall, then pursues a northerly course past Augsburg (where it receives the Wertach), and joins the Danube from the right just below Donauwörth (1330 feet). Its total length is 177 miles. Its drainage basin has an area of 2550 square miles. It is not navigable, owing to its torrential character and the gravel beds which choke its channel. More than once great historic events have been decided upon its banks. On the Lechfeld, a stony waste some miles long, between the Lech and the Wertach, the Emperor Otho I. defeated the Hungarians in 955. Tilly, in attempting to defend the passage of the stream at Rain against the forces of Gustavus Adolphus, was fatally wounded, on 5th April 1632.

Lecky, William Edward Hartpole (1838—), Irish historian and publicist, was born at Newport Park, near Dublin, on 26th March 1838, being

the eldest son of John Hartpole Lecky, whose family have for many generations been landowners in Ireland. He was educated at Kingstown, Armagh, and Cheltenham College, and at Trinity College, Dublin, where he graduated B.A. in 1859 and M.A. in 1863, and where, with a view to becoming a clergyman in the Irish Protestant Church, he also went through a course of divinity. In 1860 he published anonymously a small book entitled *The Religious Tendencies of the Age*, but on leaving college he soon abandoned his first intention and turned to historical work. In 1861 he published *The Leaders of Public Opinion in Ireland*, a brief sketch of the lives and work of Swift, Flood, Grattan, and O'Connell, which gave decided promise of his later admirable work in the same field. This book, originally published anonymously, was republished in 1871; and the essay on Swift, rewritten and amplified, appeared again in 1897 as an introduction to a new edition of Swift's works. Two learned surveys of certain aspects of European history followed: *A History of the Rise and Influence of Rationalism in Europe* (2 vols., 1865), and *A History of European Morals from Augustus to Charlemagne* (2 vols., 1869). Some criticism was aroused by these books, especially by the last named, with its opening dissertation on "the natural history of morals," but both have been generally accepted as acute and suggestive commentaries upon a wide range of facts. Lecky then devoted himself to the chief work of his life, *A History of England during the Eighteenth Century*, vols. i. and ii. of which appeared in 1878, and vols. vii. and viii. (completing the work) in 1890. His object was "to disengage from the great mass of facts those which relate to the permanent forces of the nation, or which indicate some of the more enduring features of national life," and there can be no doubt that in the carrying out of this task Lecky displays many of the qualities of a great historian. The work is distinguished by the lucidity of its style, by the fulness and extent of the authorities referred to, and, above all, by the judicial impartiality maintained by the author throughout. These qualities are perhaps most conspicuous and most valuable in the chapters which deal with the history of Ireland, and in the cabinet edition of 1892, in 12 vols. (frequently reprinted) this part of the work is separated from the rest, and occupies five volumes under the title of *A History of Ireland in the Eighteenth Century*. A volume of *Poems*, published in 1891, was characterized by a certain frigidity and by occasional lapses into commonplace, objections which may also be fairly urged against much of Lecky's prose-writing. In 1896 he published two volumes on contemporary politics, entitled *Democracy and Liberty*, in which he considered, with special reference to Great Britain, France, and America, some of the tendencies of modern democracies. The somewhat gloomy conclusions at which he arrived provoked much criticism both in Great Britain and America, which was renewed when he published in a new edition (1899) an elaborate and very depreciatory estimate of Gladstone, then recently deceased. This work, though essentially different from the author's purely historical writings, has many of their merits, though it was inevitable that other minds should take a different view of the evidence. In *The Map of Life* (1900) he discussed in a popular style some of the ethical problems which arise in everyday life. Though always a keen sympathizer with the Irish people in their misfortunes and aspirations, and though he had criticized severely the methods by which the Act of Union was passed, Lecky was from the first strenuously opposed to Gladstone's policy of Home Rule, and in 1895 he was returned to Parliament as Unionist member for Dublin University. In 1897 he was made a privy councillor; and among the Coronation Honours in 1902 he was

nominated an original member of the new Order of Merit. His university honours include the degree of LL.D. from Dublin, St Andrews, and Glasgow, the degree of D.C.L. from Oxford, and the degree of Litt.D. from Cambridge. In 1894 he was elected corresponding member of the Institute of France. He contributed occasionally to periodical literature, and two of his addresses, *The Political Value of History* (1892) and *The Empire, its Value and its Growth* (1893), were published. He married in 1871 Elizabeth, baroness de Dedem, daughter of baron de Dedem, a general in the Dutch service. Mrs Lecky has contributed to various reviews a number of articles, chiefly on historical and political subjects.

Lecocq, Alexandre Charles (1832—), French musical composer, was born in Paris, 3rd June 1832. He was admitted into the Conservatoire in 1849, being already an accomplished pianist. He studied under Bazin, Halévy, and Benoist, winning the first prize for harmony in 1850, and the second prize for fugue in 1852. He first gained notice by dividing with Bizet the first prize in a competition for an operetta instituted by Offenbach. His operetta, *Le Docteur Miracle*, was performed at the Bouffes Parisiens in 1857. After that he wrote constantly for theatres, but produced nothing worthy of mention until *Fleur de Thé* (1868), which ran for more than a hundred nights. *Les Cent Vierges* (1872) was favourably received also, but all his previous successes were cast into the shade by *La Fille de Madame Angot* (Paris, 1873; London, 1873), which was performed for 400 nights consecutively, and has since gained and retained enormous popularity all over the civilized world. Since 1873 Lecocq has produced a large number of comic operas, though he has never equalled his early triumph in *La Fille de Madame Angot*. Among the best of his pieces are *Giroflé-Girofla* (Paris and London, 1874); *Les Prés Saint Gervais* (Paris and London, 1874); *La Petite Mariée* (Paris, 1875; London, 1876, revived as *The Scarlet Feather*, 1897); *Le Petit Duc* (Paris, 1878; London, as *The Little Duke*, 1878); *La Petite Mademoiselle* (Paris, 1879; London, 1880); *Le Jour et la Nuit* (Paris, 1881; London, as *Manola*, 1882); *Le Cœur et la Main* (Paris, 1882; London, as *Incognita*, 1893); *La Princesse des Canaries* (Paris, 1883; London, as *Pepita*, 1888). In 1899 a ballet by M. Lecocq, entitled *Le Cygne*, was produced at the Opéra Comique in Paris. Of late years his compositions, though produced somewhat less rapidly, have not equalled the success of his earlier works. His works have a finish, both as regards the vocal writing and the instrumentation, which it would be vain to seek in the productions of most of his contemporaries.

Lecote de Lisle, Charles Marie René (1818—1894), the most scholarly of modern French poets, was born in the island of Réunion, 23rd October 1818; he died at Paris, 17th July 1894. Most of his life, from at least his thirtieth year, was spent in Paris, where he lived a quiet life among books. In 1873 he was made librarian at the Luxembourg; in 1887 he was elected to the Academy in succession to Victor Hugo. His *Poèmes Antiques* appeared in 1852; the *Poèmes Barbares*, in their first form, in 1862; *Les Erinnyes*, a tragedy after the Greek model, in 1873; the *Poèmes Tragiques* in 1884; *L'Apollonide*, another classical tragedy, in 1888; and *Derniers Poèmes*, after his death, in 1899. In addition to his original work in verse, he published a series of admirable prose translations of Homer, Hesiod, Æschylus, Sophocles, Euripides, Virgil, Horace. In Lecote de Lisle the Parnassian movement seems to crystallize. His verse is clear, sonorous, dignified, deliberate in movement, classically correct in rhythm, full of exotic local colour, of savage names, of realistic rhetoric. It has

its own kind of romance, in its "legend of the ages," so different from Hugo's, so much fuller of scholarship and the historic sense, yet with so far less of human pity. Coldness cultivated as a kind of artistic distinction seems to turn all his poetry to marble, in spite of the fire at its heart. Most of Leconte de Lisle's poems are little chill epics, in which legend is fossilized. They have the lofty monotony of a single conception of life and of the universe. He sees the world as what Byron called it, "a glorious blunder," and desires only to stand a little apart from the throng, meditating scornfully. Hope, with him, becomes no more than this desperate certainty:—

"Tu te tairas, ô voix sinistre des vivants!"

His only prayer is to Death, "divine Death," that it may gather its children to its breast:—

"Affranchis-nous du temps, du nombre et de l'espace,
Et rends-nous le repos que la vie a troublé!"

The interval which is his he accepts with something of the defiance of his own Cain, refusing to fill it with the triviality of happiness, waiting even upon beauty with a certain inflexible austerity. He listens and watches, throughout the world, for echoes and glimpses of great tragic passions, languid with fire in the East, a tumultuous conflagration in the Middle Ages, a sombre darkness in the heroic ages of the North. The burning emptiness of the desert attracts him, the inexplicable melancholy of the dogs that bark at the moon; he would interpret the jaguar's dreams, the sleep of the condor. He sees nature with the same wrathful impatience as man, praising it for its destructive energies, its haste to crush out human life before the stars fall into chaos, and the world with them, as one of the least of stars. He sings the "Dies Irae" exultingly; only seeming to desire an end of God as well as of man, universal nothingness. He conceives that he does well to be angry, and this anger is indeed the personal note of his pessimism; but it leaves him somewhat apart from the philosophical poets, too fierce for wisdom and not rapturous enough for poetry. (A. S. Y.)

Leech.—The group of leeches, Hirudinea, are now certainly known to be related to the Oligochæta, and not, as was formerly thought, to the Platyhelminths. They share with the Oligochæta the following characters, the greater part of which are most pronounced in the genus *Acanthobdella*. The body is regularly segmented, and two or three segments are modified into a clitellum, which secretes the cocoon in which the eggs are contained. Paired setæ are present on five of the anterior segments of *Acanthobdella* (Fig. 1), which have the form of Oligochæta setæ, and are much hooked at the tip and proportionately large, as in the tail setæ of the earthworm genus *Onychochæta*. The

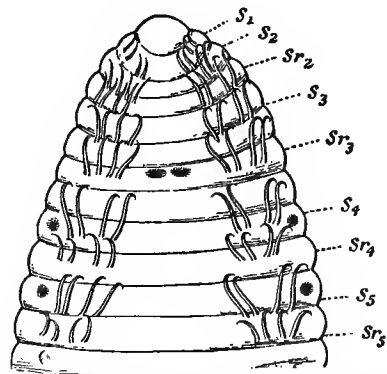

FIG. 1.—*Acanthobdella*, from the ventral surface, showing the five sets of setæ (S_1 to S_5) and the replacing setæ (Sr_1 to Sr_5) behind them. The three pairs of pigmented spots show the position of the eyes on the dorsal surface. (After Kowalevsky.)

existence of branchiæ in *Branchiobdella* and *Cystobranchus* is paralleled in the Oligochæta, the more complex gills of the former genus being comparable to those of *Alma*, and the simpler gills of *Cystobranchus* to

those of *Branchiura* and *Hesperodilus*. The universal sucker of the leeches and the chitinous jaws characteristic of many of them are to be found also in the undoubted Oligochæta family Discodrilidæ. The generative pores are median and single, the male pore being in front of the female pore. This is not so general in the Oligochæta, but is found in various genera, and in the Eudrilid *Polytoreutus* there is the same relative position of male and female pore coupled with their median position. All leeches possess a cœlom (Fig. 2)

FIG. 2.—Section of *Acanthobdella* (after Kowalevsky). c , cœlom; $c.ch.$, cœlom epithelium (yellow-cells); cp , glandular cells; cl , muscle cells of lateral line; ep , pigment cells; ep , ectoderm; g , nerve cord; m , intestine; mc , circular muscle; ml , longitudinal muscle; vd , dorsal vessel; vv , ventral vessel.

which is (in the embryo, and permanently in the case of *Acanthobdella*) arranged in a series of chambers, separated by septa, as in the Oligochætes. The large obliteration of the cœlom, in the majority of forms, led to the comparison of these animals with the Platyhelminths, where the cœlom seems to be limited to the intra-gonadial chambers, and perhaps to a few scattered lacunæ in the "mesenchyme" (though these latter spaces are possibly more comparable to a feeble and commencing vascular system). The nephridia are paired and of the same structure as in the Oligochætes. There is a complex vascular system, consisting of at any rate a dorsal and a ventral trunk, with capillary networks in the body wall and upon the walls of the gut. In general this is comparable to that of the Oligochæta. The organs of reproduction are at first sight different, and do differ in detail from those of the Oligochæta. The testes are either a number of separate pairs of round bodies or (in *Acanthobdella*) a single pair of elongated structures lying along the sides of the body (Fig. 3). They lie in

FIG. 3.—Section of *Acanthobdella* (after Kowalevsky). Identical letters as in Fig. 2; in addition, cn , nerve cord; in , intestine; nf , parts of nephridium; on , external opening of nephridium; ov , ova; t , testis.

chambers which are undoubtedly cœlomic, but their ducts are continuous with them. This is also the case with the ovaries

and oviducts. It seems to be possible that we have here to do with a state of affairs which is different from that of most earthworms, but comparable to what is found in the Eudrilidæ. There is, in short, no salient feature which distinguishes all leeches from all earthworms. Indeed, even in the smallest particulars unexpected resemblances occur. Thus in both groups the epidermis may be invaded by blood capillaries, and the structure of the muscle fibres once regarded as peculiar to the leeches is also characteristic of earthworms. In the limited clitellum, which generally occupies segments ix., x., xi., in the forward position of the gonads, and the external apertures of their ducts, tenth and eleventh (seventh and eighth in *Acanthobdella*), and in the limited number of segments of which the body is composed (not more than thirty-three), the leeches seem to be particularly like certain of the lower aquatic Oligochaeta.

The leeches are characterized by their form, which is generally somewhat or very much flattened, and wider at the posterior than at the anterior end. There are an anterior and a posterior sucker as a rule. The anus opens dorsally to the posterior sucker; the mouth is in the middle of the anterior sucker. The characteristic form of the body is lost in *Lumbricobdella*, which lives in the soil and which has no posterior sucker at all.

The anterior end of the body is provided with eyes, which appear to be simply specializations of sense-organs found upon other segments of the body, and arranged with accurate reference to the segmentation. In the majority of leeches the body cavity is much modified, and reduced by the abundant growth of connective tissue in the body-wall to the state of a complex system of tubes. It has been asserted, denied, and reasserted, that this system of tubes which represents the coelom is in communication with the vessels of the vascular system. The observations of Goodrich appear to have conclusively shown that this connexion exists. The leeches possess paired and metamerically-disposed nephridia. In *Pontobdella* alone, so far as is known, the nephridial system forms a network from segment to segment. It is interesting to note that in *Branchobdella* the nephridia lie behind the limits of the coelom between the testes and the coelom. In the Capitellidæ the nephridia are in the same way retroperitoneal. A pervious funnel may or may not exist; in *Hirudo* the representative of the funnel is a "cabbage-head-like mass" of cells which has not a coelomic orifice at all. In the more simple organized *Glossiphonia* there is a plain internal aperture.

The mouth cavity has or has not sharp-edged chitinous jaws; the canal which follows is either more simple or complicated by lateral diverticula; in *Aulastoma* there is but one pair of these diverticula. The gonads, as already mentioned, are hollow and continuous with their ducts. Generally there are six to ten pairs of globular and metamerically-arranged testes, whose products are collected by means of a branch apiece into a longitudinal sperm duct which opens anteriorly into a muscular penis. A remarkable fact concerning the spermatophores has been discovered by Whitman. It appears that in *Glossiphonia plana* the spermatophore is attached anywhere to the body of another individual, and that the spermatozoa issuing therefrom find their way through the body-wall into the interior of the body. Like the Oligochaeta, leeches are hermaphrodite; the ovaries are small rounded bodies or long masses of germinal tissue, and they are contained in a sac which communicates with a duct which becomes muscular before the external orifice, and constitutes a vagina. There are no structures corresponding to the spermathecæ of Oligochaeta. A cocoon is not always, but is often, formed. Some leeches carry their eggs about

with them, and others deposit them upon stones and such like places.

The Hirudinea may be divided into three families:—

(1) *Rhynchobdellidæ*.—A protrusible proboscis exists, but there are no jaws. The blood is colourless. Marine and fresh-water forms. *Pontobdella*, *Piscicola*, *Glossiphonia*, *Branchellion*, *Batrachobdella*, &c.

(2) *Gnathobdellidæ*.—Hirudinea with no proboscis, but with well-developed or vestigial jaws. The blood is red. Fresh-water or terrestrial. *Trocheta Hirudo*, *Aulastomum*, *Nepheleis*, *Hemadipsa*, &c.

(3) *Acanthobdellidæ*.—A protrusible proboscis present, but short. On five anterior segments setæ of the oligochaetous pattern are present, accompanied by reserve setæ. Male and female pores more anterior in position than in other families. Coelom divided into twenty compartments by septa. Testes form a pair of continuous tubes. *Acanthobdella*, &c. (F. E. B.)

Leeds, a city (1893), municipal, county (1888), and parliamentary borough of Yorkshire, England, on the Aire, 25½ miles by rail south-west of York, 185 miles by rail north-west of London; station on the Great Northern, Midland, North-Eastern, North-Western, and Lancashire and Yorkshire railways. In 1885 the parliamentary borough was parcelled out into five divisions, returning each one member. In 1897 the chief magistrate was raised to the dignity of Lord Mayor. The city is practically cut into halves by the river Aire, over which there are now eight bridges. There are more than 60 Established and 7 Roman Catholic churches, and about 150 Dissenting places of worship. Yorkshire College, erected on its new site of 3½ acres in 1885 at a cost of £150,000 became in 1887 one of the constituent colleges of the Victoria University, Manchester. Important additions, as well in its buildings as in its departments and equipments of study, include a hall of residence, an engineering department (1886), a central hall and library (1894), a medical department (1894), and a textile department. The attendance at the college during the session 1900–01 numbered 795 day and 339 evening students. Other educational institutions are a day training college (1891), as a branch of the Yorkshire College; the Yorkshire Ladies' Council of Education, for the promotion of female education and the instruction of girls and women of the artisan class of domestic economy, &c. The School Board has 64 schools and 4 industrial schools under its control, with a number on roll of 54,750 and an average attendance of 49,100. There are also 39 National and 10 Catholic schools. Amongst newer buildings may be mentioned the municipal offices (1884), costing £120,000; the city art gallery (1888); the Coliseum (1885); five sets of corporation baths (1895); corporation Turkish baths (1898); general post office (1896); extension of general infirmary (1892), costing £48,671; Mauston Hall (97 acres), for fever patients, purchased 1896; cattle market (1886); meat market (1899), costing £42,000. The corporation has expended large sums of money on street improvements, clearing of insanitary areas, electrical equipment of tramways, and provision of additional parks and recreation grounds in various parts of the city. The city fever and smallpox hospitals are being extended at a cost of upwards of £200,000. New general markets are also being built at the estimated cost of £100,000. Leeds is the largest producer of leather in England, though no sole leather is tanned. The largest source of supply of hides is British India, from which some 20,000 arrive every week half-tanned in India and finished in Leeds, and about 15,000 every week raw or "arsenic-cured." Other industries include machine-made clothing, hats and caps, boots and shoes, nails, and artificial silk. In 1891 there were 9208 persons engaged in the making of machinery; 7615 males and 9152 females in the manufacture of wool and worsted fabrics; 1398 males and 784 females in the production of mixed materials; 3204 persons in furriery, tannery, and

curriery; 9229 persons in the iron and steel manufactures; and 2520 in coal-mining. There are 5 daily newspapers. The rateable value of the city amounted (31st March 1901) to £1,741,373; and the income derived from the city rate, £174,457; from other sources, £84,423. The debt of the Urban District Council amounted (31st March 1901) to £7,218,816. Area of the municipal and parliamentary borough, which are coextensive, 21,572 acres. Population (1881), 309,119; (1891), 367,505; (1901), 428,968. (c. n.)

Leek, a market town in the Leek parliamentary division of Staffordshire, England, 24 miles north by east of Stafford by rail. Modern erections are Established and Roman Catholic churches, an institute (containing free library, lecture-hall, art galleries, and school of art), a technical school, and extensive almshouses. Sewing silk, braids, buttons of silk, &c., are manufactured. Area of civil parish (an urban district), 1440 acres. Population (1881), 12,863; (1891), 14,128; (1901), 15,484.

Leeuwarden, capital of the Dutch province of Friesland, on the Ee, 31 miles west of Groningen. Of modern foundation are the museum of the Frisian Society, with its ethnographical and antiquarian collections, and a commercial school. The law courts have been restored since 1895, and now contain the provincial library and archives. Population (1900), 32,203.

Leeward Islands, a group of British West India Islands, under one Governor-General, divided into five provinces, namely, Antigua (with Barbuda and Redonda), St Kitts (with Nevis and Anguilla), Dominica, Montserrat, and the Virgin Islands. There is one Federal Executive Council nominated by the Crown, and one Federal Legislative Council—ten nominated and ten elected members. Of the latter, four are chosen by the unofficial members of the local Legislative Council of Antigua, two by those of Dominica, and four by the non-official members of the local Legislative Council of St Kitts Nevis. In Antigua and Dominica the representative element in the legislature was suppressed in 1898. The Federal Legislative Council meets once a year. For details see articles on the separate islands.

Legal Education.—In England the teaching of English law was until recent times exclusively professional in character. It was left almost entirely in the hands of members of the legal profession. It is true that from the 12th century onwards law was taught in one or both of the great English universities. But the law so taught was the Roman law or the Canon law. Until Blackstone began to lecture at Oxford in 1754, the English universities gave no assistance in the teaching or in the scientific exposition of English law. This may have been, as was suggested by Chief Justice Fortescue, because the laws of the land were to be learned in three tongues, the English, the French, and the Latin, while the universities conducted their teaching in the Latin tongue alone. It may have been because, for centuries after the reign of Edward I., the law of England was a technical and obscure craft, incapable of forming part of a scheme of liberal education. Whatever the reason, it is certain that in the craft of the law, as in other crafts, the training of students and apprentices was left to those who were themselves members of the craft. As long as there was a real corporate life among the members of the Inns of Court, the work of education was regarded as one of the most important of the duties of the fellows of the society of each Inn, and practising lawyers took part actively and personally in that work. Students came together to reside in the Inns of Court and

Inns of Chancery, which were established in the regions near Holborn and Temple Bar. The convenience of this situation was remarked by Fortescue. The Inns were placed in the suburbs of the City, that the quietness of the students might not be disturbed, and near the King's Court, that students might daily have access thereto without weariness. Inns or hostels for students were certainly in existence in this quarter as early as the reign of Edward III. When Fortescue wrote his treatise *De Laudibus Legum Anglicæ* in the 15th century, the four Inns of Court and the ten Inns of Chancery were fully organized. A student entered first at an Inn of Chancery, and later, growing to ripeness, he was admitted to an Inn of Court. The Inns together constituted, according to Fortescue, "an university or schoole of all commendable qualities requisite for noblemen." At the Inns of Court readings were delivered by the benchers, generally, it is to be observed, on a statute, rather than on fundamental legal principles. Such famous names as Littleton, Coke, and Bacon are to be found among the names of the readers. At the Inns of Chancery the education of students was undertaken by barristers from the Inns of Court. Besides the readings, there were regular moots and bolts, at which the acquisition of the art of advocacy was encouraged by the arguing of fictitious legal cases.

Inns of Court.

In the 16th and 17th centuries the corporate life of the Inns of Court became less and less active. The general decay of the organization of crafts and guilds showed itself among lawyers as among other craftsmen. Successful barristers, sharing in the general prosperity of the country, became less and less able and willing to devote their time to the welfare of their profession as a whole. The Inns of Chancery, though some of their buildings still remain—picturesque survivals in their "suburbs"—have long ceased to be used as places for the education of students. The benchers of the Inns of Court, until the revival towards the middle of the 19th century, had wholly ceased to concern themselves with the systematic teaching of law.

The modern system of legal education may be said to date from the establishment, in 1852, of the Council of Legal Education, a body of twenty judges and barristers appointed by the four Inns of Court to control the legal education of students preparing to be called to the bar. The most important feature is the examination which a student must pass before he can be called. The examination serves the double purpose of fixing the compulsory standard which all must reach, and of guiding the reading of students who may desire, sooner or later, to carry their studies beyond this standard. The subjects in which the examination is held are divided into six groups: Roman Law; Constitutional Law and Legal History; Evidence, Procedure, and Criminal Law; Real and Personal Property; Equity; and Common Law. The subjects in the first three groups may be taken, either separately or together, earlier than the subjects in the last three groups. On each group of subjects a single paper of written questions is set, to be answered in three hours, and each candidate is also asked a few short questions *viva voce*. The Council of Legal Education also appoint a body of Readers and Assistant Readers, nine in number, who deliver lectures and hold classes on the subjects of the examinations. The Reader and Assistant Reader in Roman Law also give part of their time to instruction in Jurisprudence and International Law, but the time given to these subjects is necessarily limited. The Readers and Assistant Readers are all practising barristers, and the instruction given by them is intended not merely to enable their pupils to pass the examinations, but also to give them a practical preparation for actual work at the bar.

Council of Legal Education.

The lectures and classes, though primarily intended for students preparing for the bar, are open to persons who are not members of any Inn of Court. The Council of Legal Education also provide for occasional courses of evening lectures on special subjects, delivered by barristers who are recognized authorities on these subjects. These special courses of lectures are generally attended by large numbers of students, but they can hardly be said to form part of any definite system of education.

It is the general opinion of English lawyers that the best education in the principles and practice of the law is not and cannot be obtained from any lectures or formal instruction. Law, like other arts and sciences, is learnt rather than taught. For any one who is capable of learning, the text-books which now cover the whole ground of legal study afford opportunities which did not exist when Littleton and Coke lectured. Still more important is the universal custom by which a student reads for a year or more as a pupil in the chambers of some practising barrister. In the 18th century it first became usual for students to read with a solicitor or attorney, and after a

short time the modern practice grew up of reading in the chambers of a conveyancer, equity draftsman, or special pleader, or, in more recent times, in the chambers of a junior barrister. The value of the education so obtained varies in different cases. Sometimes the advantages gained consist only in the insight obtained into actual work and into the manner in which an experienced lawyer deals with it. Sometimes the relation between pupil and teacher gives rise to a close personal intercourse of the highest educational value. Reading in chambers is so far considered a necessary part of a barrister's education that it has been said that a barrister would no more think of beginning work at the bar without this previous training than a doctor would think of setting up in practice without having walked the hospitals. But before entering a barrister's chambers as a pupil, and still more before taking advantage of the courts themselves as a school of law, it is important that a student should have acquired a sound knowledge of the elementary principles of law, and the expression "legal education" is commonly used to signify the teaching, or the learning, of these elementary principles. It is the function of the Council of Legal Education to provide for instruction in these elementary principles. It does so almost entirely from a practical professional standpoint. It is very little concerned with instruction in what may be called non-professional law, with assisting in the philosophical study of jurisprudence, or the general principles of law as part of a liberal education. On the other hand, it takes no part in promoting the acquisition of the art of advocacy, but something is done, so far as fluent speaking is concerned, by debating societies, which carry on the traditions of the Oxford and Cambridge Unions. An attempt has been made to revive the ancient moots, and this experiment has been attended by a certain amount of success.

The education of solicitors suffered from the absence of any professional organization until the Incorporated

Incorporated Law Society.

Law Society was established in 1825 and the following years. So far as any professional education is provided for solicitors or required from them, this is due to the efforts of the Law Society. As early as 1729 it was required by statute that any person applying for admission as attorney or solicitor should submit to examination by one of the judges, who was to test his fitness and capacity in consideration of a fee of one shilling. At the same time regular preliminary service under articles was required, that is to say, under a contract by which the clerk

was bound to serve for five years. The examination soon became, perhaps always was, an empty form. The Law Society, however, soon showed zeal for the education of future solicitors. In 1833 lectures were instituted. In 1836 the first regular examinations were established, and in 1860 the present system of examinations—preliminary, intermediate, and final—came into effect. Of these only the last two are devoted to law, and both are of a strictly professional character. The final examination is a fairly severe test of practical acquaintance with all branches of modern English law. The Law Society makes some provision for the teaching of students, but this teaching is designed solely to assist in preparation for the examinations.

At the Universities of Oxford and Cambridge there has, since 1850, been an attempt to promote the study of law. The curriculum of legal subjects in which lectures are given and examinations held is calculated to give a student a sound fundamental knowledge of general principles, as well as an elementary acquaintance with the rules of modern English law. Jurisprudence, Roman Law, Constitutional Law, and International Law are taught, as well as the Law of Real and Personal Property, the Law of Contract and Tort, Criminal Law, Procedure, and Evidence. But the law tripos and the law schools do not attract a very large number of university students, and no doubt they suffer from remoteness from the law courts, and from the exclusively academical character of the teaching. Law is also taught, though not on a very large scale, at Owens College, Manchester, and at University College, Liverpool. London University has encouraged the study of law by its examinations for law degrees, at which a comparatively high standard of knowledge is required; and at University College, London, and King's College, London, some teaching is given in law and jurisprudence. In the new University of London it is hoped that one day there may be a faculty of Law in which the Inns of Court will co-operate. In this way it is possible that an adequate national system of legal education may be established, in which due attention will be given both to professional law and to non-professional law. But at present the four Inns of Court have declined to take any part in the new University, and the faculty of Law is not likely to be established in the immediate future.

(A. LL. D.)

Leghorn, an Italian city, chief town of the province of the same name, seat of a bishopric and of a large naval academy—the only one in Italy—and the third largest commercial port in the kingdom, situated on the west coast, 15 miles south-west of Pisa by rail. It is built along the seashore upon a healthy and fertile tract of land, which forms, as it were, an oasis in a zone of Maremma. Several improvements were carried out in the city and port during the last two decades of the 19th century. The naval school formerly established partly at Naples and partly at Genoa has been transferred to Leghorn. Some of the navigable canals connecting the harbour with the interior of the city have been either modified or filled up. Several streets have been widened, and a road along the shore has been transformed into a promenade worthy of comparison with the Promenade des Anglais at Nice, being shaded by tamarisks, stone-pines, oleanders, aloes, and countless evergreen shrubs, and adorned with luxuriant flower-beds. For Leghorn is the principal sea-bathing resort in this part of Italy, the season lasting from the end of June to the end of August. The *octroi* circle has been enlarged, large school buildings erected, and a covered market built on a scale almost too grandiose for the needs of the city. Dredging operations have been continued,

and are now proceeding in both the old and the new harbour, but still without effecting any considerable increase in the depth. The new rectilinear mole, sanctioned in 1881, has been built out into the sea for a distance of 600 yards from the old Vegliaia lighthouse, and the docking basin has been lengthened to 490 feet. Inside the breakwater the depth varies from 10 to 26 feet. In order partly to compensate the city for the losses occasioned by the abolition of the freedom of the port—a freedom which had rendered it one of the most flourishing in Italy—a bonded *dépôt* was established in 1881. The northern part of the old port was filled in, and upon the area thus created sheds and warehouses were built. Sufficient space was, however, left between the warehouses and the old breakwater to form a wharf for the discharge of cargoes. The total trade of the port increased from £3,861,250 in 1891 to £5,191,670 in 1900, the ratio of imports to exports being as three to two. The imports consist principally of tobacco, coal, wheat, fish, and hides, and the exports of hemp, hides, olive oil, soap, coral, candied fruit, and marble and alabaster. Since the year 1885 the decrease in the number of foreign vessels, which began towards the middle of the 19th century, has continued, although there has been a slight increase in the number of Italian vessels. In 1885 the total number of vessels that entered the port was 4281 of 1,434,000 tons; of these, 1251 of 750,000 tons were foreign. 591,620 tons of merchandise were loaded and unloaded. In 1900, after considerable fluctuations during the interval, the total number that entered was 4747 vessels of 1,839,954 tons; of these, 740 of 760,830 tons were foreign. In 1899, 901,726 tons of merchandise were loaded and unloaded, an increase of more than 300,000 tons over the total of 1885. A great obstacle to the development of the port is the absence of modern mechanical appliances for loading and unloading vessels. The older shipyards have been considerably extended, and shipbuilding is actively carried on, while new industries—namely, glass-making and copper- and brass-founding—have been established. The population of the city proper has decreased, namely, from 82,976 in 1881 to 79,526 in 1901, but the population as a whole has increased: in 1881 it numbered 97,615, and in 1901, 98,505. The former British “factory” here was closed in 1825. The two villages of Ardenza and Antignano, which form part of the commune, have acquired considerable importance, the former in part for sea-bathing. (A. R*.)

Legnago, a fortified town in the province of Verona, Lombardy, Italy, on the Adige, 29 miles by rail east of Mantua, one of the famous Quadrilateral fortresses. The present fortifications were planned and made in 1815, the older defences having been destroyed by Napoleon I. in 1801. There is a school of the industrial arts and sciences. It is the birthplace of G. B. Cavalcaselle, the art historian (1827–1897). Rice is extensively grown in the vicinity. Population (1881), 5448; (1897), about 3500.

Legnano, a town in the province of Milan, Lombardy, Italy, 17 miles north-west of Milan by rail. It is the seat of important cotton and silk industries, with machine-shops, boiler-works, and dyeing and printing of woven goods, and thread. Close by the Lombard League defeated Frederick Barbarossa in 1176; a monument in commemoration of the battle was erected on the field in 1876. Population (1881), 7153; (1897), about 5400.

Legouvé, Gabriel Jean Baptiste Ernest Wilfrid (1807—), French dramatist, the son of the poet Gabriel Legouvé (1764–1812), was born in Paris on 5th February 1807. He was left an orphan at an

early age, his mother dying in 1810, and his father almost immediately afterwards being removed to a lunatic asylum. The child, however, inherited a considerable fortune, and was very carefully educated. The celebrated Jean Nicolas Bonilly (1763–1842) was his tutor, and early instilled into the young Legouvé a passion for literature, to which, indeed, the example of his father and of his grandfather, J. B. Legouvé (1729–1783), predisposed him. As early as 1829 he carried away a prize of the French Academy for a poem on the discovery of printing; and in 1832 he published a curious little volume of verses, entitled *Les Morts Bizarres*. In those early days M. Legouvé brought out a succession of novels, of which one at least, *Edith de Falsen*, enjoyed a considerable success. In 1847 he began the work by which he will be best remembered, his contributions to the development and education of the female mind, by lecturing at the College of France on the moral history of women: these discourses were collected into a volume in 1848, and enjoyed a great success. M. Legouvé wrote considerably for the stage, and in 1849 he collaborated with Scribe in *Adrienne Lecouvreur*, one of the most admired and most widely accepted of modern French tragedies. M. Legouvé now became a prolific writer for the theatre, and in 1855 he brought out his tragedy of *Médée*, the success of which had much to do with his election to the French Academy. He succeeded to the fauteuil of Ancelot, and was received by Flourens, who dwelt on the plays of M. Legouvé as his principal claim to consideration. As time passed on, however, M. Legouvé became less and less prominent as a playwright, and more and more so as a lecturer and propagandist on woman's rights and the advanced education of children, in both of which directions he has been a pioneer in French society. His *La femme en France au XIX^{me} siècle* (1864), reissued, much enlarged, in 1878; his *Messieurs les enfants* (1868), his *Conférences Parisiennes* (1872), his *Nos filles et nos fils* (1877), and his *Une éducation de jeune fille* (1884) were works of wide-reaching influence in the moral order. In 1886–87 M. Legouvé published, in two volumes, his *Soixante ans de souvenirs*, an excellent specimen of autobiography. He was raised in 1887 to the highest grade of the Legion of Honour, and held for many years the post of inspector-general of female education in the national schools. M. Legouvé was always an advocate of physical training. He was long accounted one of the best shots in France, and although, from a conscientious objection, he never fought a duel, he made the art of fencing his lifelong hobby. In the beginning of 1900 M. Legouvé was knocked down by a vehicle in the streets of Paris. The worst was feared for the results of this accident on a man of ninety-three, but the veteran was soon seen walking and fencing as usual. After the death of Désiré Nisard in 1888, M. Legouvé became the “father” of the French Academy.

Legros, Alphonse (1837—), painter and etcher, was born at Dijon on 8th May 1837. His father was an accountant, and came from the neighbouring village of Veronnes. Young Legros frequently visited the farms of his relatives, and the peasants and landscapes of that part of France are the subjects of many of his pictures and etchings. He was sent to the art school at Dijon at an early age, with a view to qualifying for a trade, and was ultimately apprenticed to Maître Nicolardo, house decorator and painter of images. In 1851 Legros left for Paris to take another situation; but passing through Lyons he worked for six months as journeyman wall-painter under the decorator Beuchot, who was painting the chapel of Cardinal Bonald in the cathedral. In Paris he studied with Cambon, scene-painter and decorator of theatres, an experience

which developed a breadth of touch such as Stanfield and Cox picked up in similar circumstances. At this time he attended the drawing-school of M. Lecoq de Boisbaudran. In 1855 Legros attended the evening classes of the *École des Beaux Arts*, and perhaps gained there his love of drawing from the antique, some of the results of which may be seen in the Print Room of the British Museum. He sent two portraits to the Salon of 1857: one was rejected, and formed part of the exhibition of protest organized by M. Bonvin in his studio; the other, which was accepted, was a profile portrait of his father. This work was presented to the museum at Tours by the artist when his friend M. Cazin was curator. Champfleury saw the work in the Salon, and sought out the artist to enlist him in the small army of so-called "Realists," comprising (round the noisy glory of Courbet) all those who raised protest against the academical trifles of the degenerate Romantics. In 1859 Legros's "Angelus" was exhibited, the first of those quiet church interiors, with kneeling figures of patient women, by which he is best known as a painter. "Ex Voto," a work of great power and insight, painted in 1861, now in the museum at Dijon, was received by his friends with enthusiasm, but it only obtained a mention at the Salon. Legros came to England in 1863, and in 1864 married an English wife, Miss Frances Rosetta Hodgson. At first he lived by his etching and teaching as before. He then became teacher of etching at the South Kensington School of Art, and in 1876 Slade Professor at University College, London. He was naturalized as an Englishman in 1881, and remained at University College seventeen years. His influence there was exerted to encourage a certain distinction, severity, and truth of character in the work of his pupils, with a simple technique and a respect for the traditions of the old masters, until then somewhat foreign to English art. He would draw or paint a torso or a head before the students in an hour or even less, so that the attention of the pupils might not be dulled. As students had been known to take weeks and even months over a single drawing, Legros ordered the positions of the casts in the Antique School to be changed once every week. In the painting school he insisted upon a good outline, preserved by a thin rub in of umber, and then the work was to be finished in a single painting, "*premier coup*." Experiments in all varieties of art work were practised; whenever the professor saw a fine example in the museum, or when a process interested him in a workshop, he never rested until he had mastered the technique and his students were trying their 'prentice hands at it. As he had casually picked up the art of etching by watching a comrade in Paris working at a commercial engraving, so he began the making of medals after a walk in the British Museum, studying the masterpieces of Pisanello, and a visit to the Cabinet des Médailles in Paris. Legros considered the traditional journey to Italy a very important part of artistic training, and in order that his students should have the benefit of such study he devoted a part of his salary to augment the income available for a travelling studentship. His later works, after he resigned his professorship in 1892, were more in the free and ardent manner of his early days—imaginative landscapes, castles in Spain, and farms in Burgundy, etchings like the series of "The Triumph of Death," and the sculptured fountains for the gardens of the duke of Portland at Welbeck.

Pictures and drawings by Legros, besides those already mentioned, may be seen in the following galleries and museums. "Amende Honorable" (see Plate), "Dead Christ," bronzes, medals, and twenty-two drawings, in the Luxembourg, Paris; "Landscape," "Study of a Head," and portraits of Browning, Burne-Jones, Cassel, Huxley, and Marshall, at the Victoria and Albert Museum, Kensington; "Femmes en prière," National

Gallery of British Art; "The Tinker," and six other works from the Ionides Collection, bequeathed to South Kensington; "Christening," "Barricade," "The Poor at Meat," two portraits, and several drawings and etchings, collection of Lord Carlisle; "Two Priests at the Organ," "Landscape," and etchings, collection of Rev. Stopford Brooke; "Head of a Priest," collection of Mr Vereker Hamilton; "The Weed-burner," some sculpture, and a large collection of etchings and drawings, Mr Guy Knowles; "Psyche," collection of Mr L. W. Hodson; "Snow Scene," collection of Mr G. F. Watts, R.A.; thirty-five drawings and etchings, the Print Room, British Museum; "Jacob's Dream" and twelve drawings of the antique, Cambridge; "Saint Jerome," two studies of heads, and some drawings, Manchester; "The Pilgrimage" and "Study made before the Class," Liverpool Walker Art Gallery; "Study of Heads," Peel Park Museum, Salford.

Legros had etched up to the year 1900 some 672 plates.

See Dr HANS W. SINGER. "Alphonse Legros," *Die graphischen Künste* (1898).—LÉONCE BÉNÉDITE. "Alphonse Legros," *Revue de l'Art*. Paris, 1900.—COSMO MONKHOUSE. "Professor Legros," *Magazine of Art* (1882).

Lègya, called by the Shans LAI-HKA, a state in the eastern division of the southern Shan States of Burma, lying approximately between 20° 15' and 21° 30' N. and 97° 50' and 98° 30' E., with an area of 1433·15 square miles. The population was estimated at 30,000 in 1881. On the downfall of King Thibaw civil war broke out, and reduced the population to a total of only a few hundreds. In 1891 the estimated population was 8928, living in 203 villages. The population was made up as follows:—Shans, 6731; Tsungthus, 1613; Yang, 437; Shan-Chinese, 76; Burmans, 71. In 1898 the budget of the Sawbwa, or chief, showed 529 villages, with a total of 4946 houses, paying a revenue of Rs.15,845. About seven-ninths of the land under cultivation consists of wet paddy cultivation. A certain amount of upland rice is also cultivated, and cotton, sugar-cane, and garden produce make up the rest. Laihka, the capital, is noted for its iron-work, both the iron and the implements made being produced at Pang Lông in the west of the state. This and lacquer-ware are the chief exports. The imports are chiefly cotton piece-goods and salt. The general character of the state is that of an undulating plateau, with a broad plain near the capital and along the Nam Têng, which is the chief river, with a general altitude of a little under 3000 feet. The state was formerly very prosperous, and is rapidly recovering.

Leicester, a parliamentary, county, and municipal borough of England, capital of Leicestershire, on the river Soar, 96½ miles north-north-west of London. In 1891 the Midland Company built here a fine new station, and the Great Central Company have also built a station. Amongst the new churches, nearly all built of red brick with stone dressings, may be mentioned two chapels-of-ease to St Mary Magdalene, St Peter's, St Hilda, the church of the Oxford martyrs, and St Michael and All Angels. St Martin's was restored through several years ending with 1898. The Roman Catholics have three churches, and there are numerous Nonconformist chapels and meeting-houses. The secular buildings erected since 1881 include the post office, the fire station, the poor-law offices, the Tivoli theatre of varieties, the Cook Memorial Hall, the Knighton public hall, the buildings of the Association for the Blind, the Vestry Street and Cossington Street baths, the children's hospital, and the isolation hospital. The institutions deserving of mention are the free library, with 35,000 volumes and six branches; the small but valuable town library, founded in the 17th century; the permanent library (20,000 volumes); the Opera House (1877); the Theatre Royal; the Borough Lunatic Asylum, to which new wings were added in 1890 and 1900; the infirmary of 200 beds, first established in 1771; the Borough Isolation Hospital; the children's hospital, opened in 1889; the Leicester Literary

"L'AMENDE HONORABLE." By ALPHONSE LEGROS.
(In the Luxembourg Gallery. From a Photograph by Levy and Sons.)

and Philosophical Society (1835); the municipal technical and art schools; the Wyggeston schools, with which is incorporated Queen Elizabeth's grammar school, namely, the boys' grammar school and the girls' high school (opened in 1878); and Alderman Newton's Greencoat day school for boys. The School of Art has been adapted for municipal purposes. Roman pavements were discovered in 1882 and 1889. There are four public parks and several new recreation grounds. The town has an excellent water-supply. The main sewerage system was completed in 1887. Since 1868 very extensive changes and alterations have been made in the river Soar and the canal; the Newarke bridge was opened in 1898. Malting and brick-making should be included among the industries of the town. In 1888 the municipal borough was for certain purposes made a county borough. On 1st January 1892 its bounds were extended so as to take in the old parishes of Aylestone, Belgrave, Braunstone, and New Found Pool, and the parishes of West Humberstone and North Evington, and part of Leicester Abbey, the whole being constituted one civil parish. Thus extended, it is governed by a mayor, 16 aldermen, and 48 councillors. Area, 8586 acres. Birth-rate (1900), 28·3; death-rate (1900), 17·0. Population (1891), 174,624; (1901), 211,574.

See *Records of the Borough of Leicester*, edited by MARY BATESON (1899).

Leicestershire.—One of the north midland counties of England, bounded on the N. by Derby, Nottingham, and Lincoln, on the E. by Lincoln and Rutland, on the S. by Northampton and Warwick, and on the W. by Stafford.

Area and Population.—In 1891 the area of the ancient (geographical) county was 527,124 acres, and the population 373,584 persons, of whom 180,044 were males and 193,540 females, an increase of 52,566, or at the rate of 14 per cent., during the ten years 1881–91, as compared with an increase at the rate of 16·1 per cent. in the period 1871–81. In 1901 the population was 433,994. In 1891 there were 0·71 persons to an acre and 1·41 acre to a person. In the same year the area of the registration county was 551,845 acres, and the population 379,286 (183,003 males, 196,283 females), and in 1901, 440,907. Particulars of the birth-rate, death-rate, and the number of persons married per 1000 inhabitants, with illegitimacy rate per 1000 births, are contained in the following table:—

	1871–80.	1881–90.	1889–98.	1899.
Birth-rate	37·2	34·0	31·6	30·1
Death-rate	21·8	18·4	17·4	17·1
Illegitimacy-rate	52·0	46·0	43·0	41·0
Marriage-rate	16·6	14·6	15·4	16·3

In 1891 there were 497 persons of Scottish birth, 1697 of Irish birth, and 574 foreigners in the county; also 281 blind persons, 156 deaf and dumb, and 1327 insane.

Administration.—For parliamentary purposes the ancient county is divided into four divisions (Eastern or Melton, Mid or Loughborough, Western or Bosworth, Southern or Harborough), each returning one member, and the parliamentary borough of Leicester, returning two members. The administrative county includes the county borough of Leicester and the municipal borough of Loughborough. It has one court of quarter sessions, and is divided into nine petty sessional divisions. The county borough of Leicester has a separate court of quarter sessions and a separate commission of the peace. The administrative county in 1891 contained 316 entire civil parishes and part of one other, and the county borough contained 17 entire civil parishes; at the same date its area was 528,986 acres. But on 30th September 1897 the parishes of Chilcote, Donisthorpe, Measham, Stretton-en-le-Field, and Willesley, and part of the parish of Appleby, amounting in all to 7831 acres, were transferred from Derbyshire to Leicestershire, and the parishes of Over and Nether Seal and Woodville were transferred from Leicestershire to Derbyshire; whilst at the same time part of the parish of Little Bowden, amounting to 513 acres, was transferred from Northamptonshire to Leicestershire; so that the area of the administrative county is 533,078 acres. Further, owing to changes made in the county borough of Leicester, the administrative county in 1900 contained 301 entire civil parishes

and parts of two others, and the county borough one civil parish. In 1891 the ancient county contained 239 entire ecclesiastical parishes or districts and parts of 13 others; it is included partly in the dioceses of Peterborough, Southwell, and Worcester.

Education.—There is a Deaf School at Leicester. The number of elementary schools in the county on 31st August 1900 was 259, of which 36 were board schools, and 223 voluntary schools, the latter including 198 national Church of England schools, 5 Wesleyan, 9 Roman Catholic, and 11 British and "other." The average attendance during the year was 34,960, out of 42,182 children on the registers. The total school board receipts for the year were £135,809, inclusive of £1399 income under the Agricultural Rates Act.

Agriculture.—Since 1885 there has been an increase in the areas of both the permanent pasture and the meadow land, and since 1880 a slight decrease in the area planted with green crops and a large decrease in the area under corn crops and fallow. In 1900 a total of 417,114 acres was farmed by tenants, and 58,491 acres by the owners; the corresponding figures for 1889 being 404,008 and 69,842 acres respectively, and for 1895, 404,984 and 67,329 acres respectively.

The table immediately following shows the areas under the different kinds of crops at the periods named:—

Year.	Area in Cultivation.	Area under Corn Crops.	Area under Green Crops.	Area of Bare Fallow.
1880	472,720	94,090	21,885	15,709
1885	473,827	79,678	23,241	10,150
1890	473,485	73,182	21,784	8,662
1895	472,313	66,798	20,992	7,005
1900	475,605	67,340	20,847	5,131

The next table shows the numbers of live stock at the periods named:—

Year.	Cows and Heifers.	Other Cattle.	Total Cattle.	Horses.	Sheep.	Pigs.
1880	32,998	93,904	126,902	17,950	357,757	21,596
1885	42,270	107,475	149,745	17,813	322,571	26,694
1890	40,380	100,539	140,919	18,422	344,572	28,537
1895	38,699	93,025	131,724	20,587	304,589	31,321
1900	40,685	101,191	141,876	20,330	321,029	24,569

Industries.—The total number of persons employed in factories and workshops in 1897 was 80,264. Of these, 24,568 or 30 per cent. were employed in the textile industries, chiefly in the manufacture of hosiery (19,238), woollens, and cottons. The industry, however, which claimed the largest number of persons was the making of clothing, namely, 33,035; then came the making of machinery, tools, &c., with 5110 persons; bleaching and dyeing, with 2304; elastic webbing, &c., with 2098; tobacco, with 1623; paper and printing, with 1550; and wood industries, with 1400. In mines and quarries there were employed in 1900 a total of 11,157 persons. The output of the granite quarries amounted in the same year to 1,109,237 tons, of the coal mines to 2,106,443 tons, of iron ore to 750,708 tons, of clays to 527,542 tons, of limestone to 160,349 tons, and of gravel and sand to 17,345 tons. The value of all the minerals mined in the county in 1900 amounted to £1,558,977 (of which coal alone represented £1,140,936). In 1900 there were three blast furnaces active in the county (see LINCOLNSHIRE).

Authorities.—See *Records of the Borough of Leicester*, ed. by MARY BATESON, revised by W. H. STEVENSON and J. E. SROCKS. London, 1899.—A. B. EVANS. *Leicestershire Words* (English Dialect Society). London, 1881. (J. T. BE.)

Leidy, Joseph (1823–1891), American naturalist, was born in Philadelphia on the 9th September 1823. He studied mineralogy and botany without an instructor, and graduated in medicine at the University of Pennsylvania in 1844. Continuing his work in anatomy and physiology, he visited Europe in 1848, but both before and after this period of foreign study lectured and taught in American medical colleges. In 1853 he was appointed professor of anatomy in the University of Pennsylvania, paying special attention to comparative anatomy. In 1884 he promoted the establishment in the same institution of the department of biology, of which he became director, and meanwhile taught natural history in Swarthmore College, near Philadelphia. His papers on biology and palæontology were very numerous, covering both fauna and flora, and he was the recipient of various American and foreign

degrees and honours. His *Cretaceous Reptiles of the United States* (1865) and *Contributions to the Extinct Vertebrate Fauna of the Western Territories* (1874) were the most important of his larger works; the best known and most widely circulated was an *Elementary Treatise on Human Anatomy* (1860, afterwards revised in new editions). He died in Philadelphia on the 30th April 1891.

(C. F. R.)

Leigh, a municipal borough (1899) and market town in the Leigh parliamentary division of Lancashire, England, 6 miles south-east of Wigan by rail. Modern erections are a theatre and a technical school and public library. There are a town hall and public baths. Area, 6349 acres. Population (1881), 21,733; (1891), 30,815; (1901), 40,001.

Leighton, Frederick Leighton, BARON (1830–1896), English painter and sculptor, was born at Scarborough on 3rd December 1830, the son of a physician. His grandfather, Sir James Leighton, also a physician, was long resident at the Court of St Petersburg. He was taken abroad at a very early age, and did not return to live in England till he was thirty years old. In 1840 he learnt drawing at Rome under Signor Meli. The family moved to Dresden and Berlin, where he attended classes at the Academy. In 1843 he was sent to school at Frankfort, and in the winter of 1844 accompanied his family to Florence, where his future career as an artist was decided. There he studied under Bezzuoli and Segnolini at the Accademia delle Belle Arti, and attended anatomy classes under Zanetti; but he soon returned to complete his general education at Frankfort, receiving no further direct instruction in art for five years. He went to Brussels in 1848, where he met Wiertz and Gallait, and painted some pictures, including "Cimabue finding Giotto," and a portrait of himself. In 1849 he studied for a few months in Paris, where he copied Titian and Correggio in the Louvre, and then returned to Frankfort, where he settled down to serious art work under Edward Steinfeld, whose pupil he declared he was "in the fullest sense of the term." Though his artistic training was mainly German, and his master belonged to the same school as Cornelius and Overbeck, he loved Italian art and Italy, and the first picture by which he became known to the British public was "Cimabue's Madonna carried in Procession through the Streets of Florence," which appeared at the Royal Academy in 1855 (see Plate). At this time the works of the Pre-Raphaelites almost absorbed public interest in art—it was the year of Holman Hunt's "Light of the World," and the "Rescue," by Millais. Yet Leighton's picture, which was painted in quite a different style, created a sensation, and was purchased by Queen Victoria. Although, since his infancy, he had only visited England once (in 1851, when he came to see the Great Exhibition), he was not quite unknown in the cultured and artistic world of London, as he had made many friends during a residence in Rome of some two years or more after he left Frankfort in 1852. Amongst these were Giovanni Costa, Robert Browning, James Knowles, George Mason, and Sir Edward Poynter, then a youth, whom he allowed to work in his studio. He also met Thackeray, who wrote from Rome to the young Millais: "Here is a versatile young dog, who will run you close for the presidentship one of these days." During these years he painted several Florentine subjects—"Tybalt and Romeo," "The Death of Brunelleschi," a cartoon of "The Pest in Florence according to Boccaccio," and "The Reconciliation of the Montagues and the Capulets." He now turned his attention to themes of classic legend, which at first

he treated in a "Romantic spirit." His next picture, exhibited in 1856, was "The Triumph of Music: Orpheus by the Power of his Art redeems his Wife from Hades." It was not a success, and he did not again exhibit till 1858, when he sent a little picture of "The Fisherman and the Syren" to the Royal Academy, and "Samson and Delilah" to the Society of British Artists in Suffolk Street. He still lived abroad, but in 1858 he visited London and made the acquaintance of the leading Pre-Raphaelites—Rossetti, Holman Hunt, and Millais. In the spring of 1859 he was at Capri, always a favourite resort of his, and made many studies from nature, including a very famous drawing of a lemon tree. It was not till 1860 that he settled in London, when he took up his quarters at 2 Orme Square, Bayswater, where he stayed till, in 1866, he moved to his celebrated house in Holland Park Road, with its Arab hall decorated with Damascus tiles. There he lived till his death. He now began to fulfil the promise of his "Cimabue," and by such pictures as "Paolo e Francesca," "The Star of Bethlehem," "Jezebel and Ahab taking Possession of Naboth's Vineyard," "Michael Angelo musing over his Dying Servant," "A Girl feeding Peacocks," and "The Odalisque," all exhibited in 1861–63, rose rapidly to the head of his profession. The two latter pictures were marked by the rhythm of line and luxury of colour which are among the most constant attributes of his art, and may be regarded as his first dreams of Oriental beauty, with which he afterwards showed so great a sympathy. In 1864 he exhibited "Dante in Exile" (the greatest of his Italian pictures), "Orpheus and Eurydice," and "Golden Hours." In the winter of the same year he was elected an Associate of the Royal Academy. After this the main effort of his life was to realize visions of beauty suggested by classic myth and history. If we add to pictures of this class a few Scriptural subjects, a few Oriental dreams, one or two of tender sentiment like "Wedded" (one of the most popular of his pictures, and well known by not only an engraving, but a statuette modelled by an Italian sculptor), a number of studies of very various types of female beauty, "Teresina," "Biondina," "Bianca," "Moretta," &c., and an occasional portrait, we shall nearly exhaust the two classes into which Lord Leighton's work (as a painter) can be divided.

Amongst the finest of his classical pictures were—"Syracusan Bride leading Wild Beasts in Procession to the Temple of Diana" (1866), "Venus disrobing for the Bath" (1867), "Electra at the Tomb of Agamemnon," and "Helios and Rhodos" (1869), "Hercules wrestling with Death for the Body of Alceste" (1871), "Clytemnestra" (1874), "The Daphnephoria" (1876), "Nausicaa" (1878), "An Idyll" (1881), two lovers under a spreading oak listening to the piping of a shepherd and gazing on the rich plain below; "Phryne" (1882), a nude figure standing in the sun; "Cymon and Iphigenia" (1884; see Plate), "Captive Andromache" (1888), now in the Manchester Art Gallery; with the "Last Watch of Hero" (1887), "The Bath of Psyche" (1890), now in the Chantry Bequest collection; "The Garden of Hesperides" (1892), "Perseus and Andromeda" and "The Return of Persephone," now in the Leeds Gallery (1891); and "Clytie," his last work (1896). All these pictures are characterized by nobility of conception, by almost perfect draughtsmanship, by colour which, if not of the highest quality, is always original, choice, and effective. They often reach distinction and dignity of attitude and gesture, and occasionally, as in the "Hercules and Death," the "Electra," and the "Clytemnestra," a noble intensity of feeling. Perhaps, amidst the great variety of qualities which they possess, none is more universal and

"CIMABUE'S MADONNA CARRIED IN PROCESSION THROUGH THE STREETS OF FLORENCE." By LORD LEIGHTON.
(Buckingham Palace.)

"CYMON AND IPHIGENIA." By LORD LEIGHTON.
(Published by permission of the Fine Art Society, London.)

more characteristic than a rich elegance, combined with an almost fastidious selection of beautiful forms. It is the super-eminence of these qualities, associated with great decorative skill, that make the splendid pageant of the "Daphnephoria" the most perfect expression of his individual genius. Here we have his composition, his colour, his sense of the joy and movement of life, his love of art and nature at their purest and most spontaneous, and the result is a work without a rival of its kind in the British School.

Leighton was one of the most thorough draughtsmen of his day. His sketches and studies for his pictures are numerous and very highly esteemed. They contain the essence of his conceptions, and much of their spiritual beauty and subtlety of expression was often lost in the elaboration of the finished picture. He seldom succeeded in retaining the freshness of his first idea more completely than in his last picture—"Clytie"—which was left unfinished on his easel. He rarely painted sacred subjects. The most beautiful of his few pictures of this kind was the "David musing on the Housetop" (1865). Others were "Elijah in the Wilderness" (1879), "Elisha raising the Son of the Shunammite" (1881), and a design intended for the decoration of the dome of St Paul's Cathedral, "And the Sea gave up the Dead which were in it" (1892), now in the Tate Gallery, and the terrible "Rizpah" of 1893. His diploma picture was "St Jerome," exhibited in 1869. Besides these pictures of sacred subjects, he made some designs for Dalziel's Bible, which for force of imagination excel the paintings. The finest of these are "Cain and Abel," and "Samson with the Gates of Gaza."

Not so easily to be classed, but among the most individual and beautiful of his pictures, are a few of which the motive was purely æsthetic. Amongst these may specially be noted "The Summer Moon," two Greek girls sleeping on a marble bench, and "The Music Lesson," in which a lovely little girl is seated on her lovely young mother's lap learning to play the lute. With these, as a work produced without any literary suggestion, though very different in feeling, may be associated the "Eastern Slinger scaring Birds in the Harvest-time: Moon-rise" (1875), a nude figure standing on a raised platform in a field of wheat.

Leighton also painted a few portraits, including those of Signor Costa, the Italian landscape painter, Mr F. P. Cockerell, Mrs Sutherland Orr (his sister), Amy, Lady Coleridge, Mrs Stephen Ralli, and (the finest of all) Sir Richard Burton, the traveller and Eastern scholar, which was exhibited in 1876 and is now in the National Portrait Gallery.

Like other painters of the day, notably Mr G. F. Watts, Lord Leighton executed a few pieces of sculpture. His

"Athlete struggling with a Python" was exhibited at the Royal Academy in 1877, and was purchased for the Chantrey Bequest collection. An illustration of this fine work is given in the article SCULPTURE, *Ency. Brit.* vol. xxi. p. 562. Another statue, "The Sluggard," of equal merit, was exhibited in 1886; and a charming statuette of a nude figure of a girl looking over her shoulder at a frog, called "Needless Alarm," was completed in the same year, and presented by the artist to Sir John Millais in acknowledgment of the gift by the latter of his picture, "Shelling Peas." He made the beautiful design for the Reverse of the Jubilee Medal of 1887. It was also his habit to make sketch models in wax for the figures in his pictures, many of which are in the possession of the Royal Academy. As an illustrator in black and white he also deserves

to be remembered, especially for the cuts to Dalziel's Bible already mentioned, and his illustrations to George Eliot's *Romola*, which appeared in the *Cornhill Magazine*. The latter are full of the spirit of Florence and the Florentines, and show a keen sense of humour, elsewhere excluded from his work. Of his decorative paintings, the best known are the elegant compositions (in spirit fresco) on the walls of the South Kensington Museum, representing "The Industrial Arts of War and Peace." There, also, is the refined and spirited figure of "Cimabue" in mosaic. In Lyndhurst church are mural decorations to the memory of Mr Pepys Cockerell, illustrating "The Parable of the Wise and Foolish Virgins."

Leighton's life was throughout marked by distinction, artistic and social. Though not tall, he had a fine presence and manners, at once genial and courtly. He was welcomed in all societies, from the palace to the studio.

He spoke German, Italian, and French, as well as English. He had much taste and love for music, and considerable gifts as an orator of a florid type. His Presidential Discourses were full of elegance and culture (published, London, 1896). For seven years (1876-83) he commanded the 20th Middlesex (Artists) Rifle Volunteers, retiring with the rank of honorary colonel, and subsequently receiving the Volunteer Decoration. Yet no social attractions or successes diverted him from his devotion to his profession, the welfare of his brethren in art, or of the Royal Academy. As president he was punctilious in the discharge of his duties, ready to give help and encouragement to artists young and old, and his tenure of the office was marked by some wise and liberal reforms. He frequently went abroad, generally to Italy, where he was well known and appreciated. He visited Spain in 1866, Egypt in 1868, when he went up the Nile with Ferdinand de Lesseps in a steamer lent by the Khedive. He was at Damascus for a short time in 1873. It was his custom on all these trips to make little

LORD LEIGHTON.

(From a photograph by Elliott and Fry, London.)

lively sketches of landscape and buildings. These fresh little flowers of his leisure used to decorate the walls of his studio, and at the sale of its contents after his death realized considerable prices. It was when he was in the full tide of his popularity and success, and apparently in the full tide of his personal vigour also, that he was struck with *angina pectoris*. For a long time he struggled bravely with this cruel disease, never omitting except from absolute necessity any of his official duties except during a brief period of rest abroad, which failed to produce the desired effect. His death occurred on 25th January 1896.

Leighton was elected an Academician in 1868, and succeeded Sir Francis Grant as President in 1878, when he was knighted. He was created a baronet in 1886, and was raised to the peerage in 1896, a few days only before his death. He held honorary degrees at the Universities of Oxford, Cambridge, Dublin, Edinburgh, and Durham, was an Associate of the Institute of France; a Commander of the Legion of Honour, and of the Order of Leopold. He was a Knight of the Coburg Order, "Dein Verdienste," and of the Prussian Order "Pour le Mérite," and a member of at least ten foreign Academies. In 1859 he won a medal of the second class at the Paris Salon, and at the Exposition Universelle of 1889 a gold medal. As a sculptor he was awarded a medal of the first class in 1878 and the Grand Prix in 1889.

Leipa. See BÖHMISCH-LEIPA.

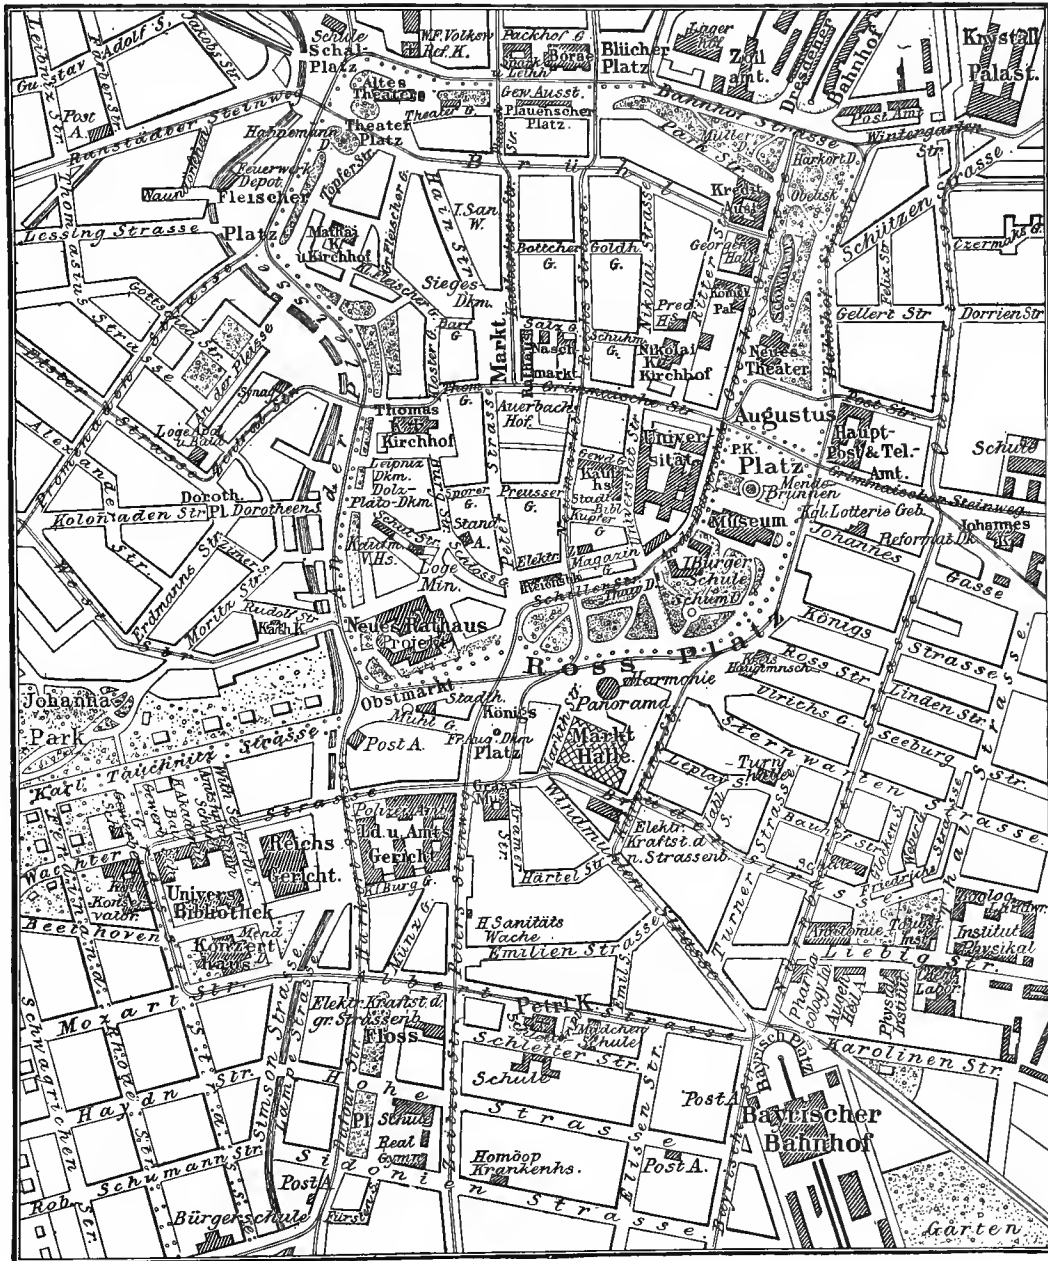

Leipzig, a town of the kingdom of Saxony, Germany, situated 101 miles by rail south-south-west of Berlin, one of the most important commercial centres of Germany, a town of very considerable and growing industrial enterprise, the seat of the Supreme Court of the empire and of one of the oldest and most influential of its universities. During the last twenty years of the 19th century an unusual number of new public buildings were erected. On Augustus Platz are the museum, to which two spacious wings were added in 1883–86; the post office, rebuilt in 1883; the university buildings, reconstructed in 1894–97; the Pauliner Kirche, also rebuilt in 1897–99; and the monumental Mende fountain (1886). The museum contains a fine picture gallery and a collection of sculpture. The university was in 1900 attended by 3269 students, a number exceeded by only Berlin and Munich; the number of professors was 220. In 1896 the old Gewandhaus or concert hall was converted into a kind of market hall for use at the fairs, a new Gewandhaus having been built, to the south-west of the old town, in 1880–84. Immediately opposite to it is the new university library (1891), which now contains some 500,000 volumes and 5000 MSS. Behind that again is the Academy of Art, one wing of which accommodates the industrial art school; and close beside it are the industrial school and the conservatory of music. Between the university library and the new Gewandhaus stands a monument of Mendelssohn (1892). Immediately to the east of the industrial art school rises the supreme court of justice of the empire (Reichsgericht), a pile which compares with the great and monumental edifice of the Reichstag in Berlin. It was built in 1888–95 from plans by Ludwig Hoffmann, and is distinguished for the symmetry and harmony of its proportions. It bears an imposing dome, 225 feet high, crowned by a bronze figure of Truth by O. Lessing, 18 feet high. In the same quarter stands the Grassi Museum (1893–96) for industrial art and ethnology, and south from it the

Gothic Petri Kirche (1885). Farther towards the north come St Thomas's church (1496; rebuilt by Lipsius in 1885–89), with a lofty roof; the historical musical museum; and a bronze statue of Leibnitz (1883). A short distance away is the Renaissance building of the Imperial Bank (1885); and the Markt Platz is adorned by a fine monument of Victory (war of 1870–71), designed by Siemering and put up in 1888. On the north side of the old town the new exchange (1884–86) and the Reformed church (1896–99) stand close together. On the east the church of St John, in which is the tomb of J. S. Bach, and outside it the tomb of Gellert, was restored in 1894–97. Opposite its main entrance is a bronze group of Luther and Melanchthon, by Schilling, unveiled in 1883 as a monument of the Reformation. A little farther to the east stand close together the German Booksellers' House, a German Renaissance structure (1886–1888), and the Book-trade House (opened in 1900). The former contains a booksellers' museum, with several fine specimens of early printing. South-west of these buildings, on the other side of the Johannisthal Park, are clustered together the medical institutes and hospitals of the university—the infirmary, women's and other hospitals, physico-chemical institute, pathological institute, physiological institute, ophthalmic hospital, pharmacological institute, the anatomy schools, chemical laboratory, the zoological institute, the physico-mineralogical institute, the botanical garden, and also the veterinary schools, deaf and dumb asylum, agricultural college, and astronomical observatory (12° 23' 30" E., 51° 20' 6" N.). In the Johanna Park are the Luther church (1883–86) and a bronze statue of Bismarck (1897); in the large park of Rosenthal (north of town) are the zoological gardens and monuments to Fechner (1897) and Gellert. It should also be mentioned that in 1897 the citadel of Pleissenburg (1213) was pulled down, with the exception of the tower, which is to be used in the construction of a projected town hall. The first commercial high school in Germany was opened here in 1898 (250 students in 1900). Since 1878 Leipzig has grown into an industrial town of the first rank. The book trades still maintain their pre-eminence, and in 1895 gave employment to over 15,000 persons. The iron and machinery trades employed 4500 persons in the same year; the textile industries (cotton and yarn-spinning, hosiery), nearly 6000; and the making of scientific and musical instruments, including pianos, 2650. Other industries, the manufacture of artificial flowers, wax-cloth, chemicals, ethereal oils and essences, beer, mineral water, tobacco and cigars, lace, india-rubber wares, rush-work, paper, the preparation of furs, and numerous other branches. These industries are mostly carried on in the suburbs of Plagwitz, Reudnitz, Lindenau, and Gohlis, all of which, along with Eutritzsch and Konnewitz, were incorporated with Leipzig in 1889–91. In respect of its commerce Leipzig ranks after Hamburg, and probably after Berlin also, but not after any other German town. The chief objects of traffic remain unaltered, but to them there have been added paper and tobacco. The annual turnover of the fur trade is estimated at 3 to 3½ million pounds sterling. Population (1885), 251,224; (1890), 295,025, or, including half a dozen suburban communes (1885), 354,899; (1895), 399,963; (1900), 455,089. (For *Plan* see p. 191.)

Leith, a municipal and parliamentary burgh, seaport, fishing port, and commercial centre, Midlothian, Scotland, on the Firth of Forth. Up till near the middle of the 19th century Leith was separated from Edinburgh by nearly two miles of open country, but in the vicinity of the main thoroughfares the ground is now built over. A considerable area in the centre of the town in the

South Leith division, which contained many antique houses and tenements, has been cleared under an Improvement Scheme authorized by the Artisans' Dwellings Act. Open spaces for playgrounds, grass plots, shrubs, and trees were railed off, and an undoubted improvement was effected, at a cost of about £120,000 Leith Links, one

of the homes of golf in Scotland, has under a Provisional Order been enclosed by railings and laid out as a public park. The old Leith High School, erected in 1806 on the south side of the links, has been demolished, and on its site the Leith School Board have erected the new Leith Academy. It is a handsome building.

PLAN OF CENTRAL LEIPZIG.

It has basement and three upper floors, and comprises physical, mechanical, and chemical laboratories. To the academy are drafted senior pupils from the other schools under the board for free instruction in the higher branches of education. The accommodation is for 946 pupils, exclusive of the science and art departments. The work of the Leith Technical College, which in 1899 had enrolled 759 individual students in its numerous evening classes, is also carried on in the academy. The Leith School Board has under its care twelve schools, affording accommodation for a total of 13,428 pupils. Secondary education is given in Craighall Road School as in the

academy. Engineering, shipbuilding, wood-sawing, twine, rope, sailcloth, hosiery, soap and chemical manure manufactures, flour-milling, biscuit-baking, are some of the industries that have made noteworthy progress; but it is as a distributing centre that the town holds the more important position. Imports of grain, flour, butter, cheese, eggs, wines, brandies, fruits, and timber increase from year to year. Exports of coal reach from seven to eight hundred thousand tons yearly. Leith is the largest centre of the whisky trade in Great Britain, and many wholesale houses have built up an export trade to the British colonies, the Continent, the United States, Canada, and

India. With the completion of the Edinburgh Dock in 1881, the dock accommodation of the port had reached nearly 43 acres, with ample quays adjoining. The steady increase of the shipping trade, and the larger tonnage of steamers trading with the Baltic, the United States, and the British colonies, made it incumbent on the Dock Commission to anticipate in good time the varied requirements of the port. It has been found practicable to make substantial reductions in the rates or port dues from time to time, and for this reason the dock revenues are an inexact index of the progress of the port. An additional dock was projected in 1890, involving the reclamation from the sea on the east side of the piers of 75 acres of the beach. The cost of the new works, including the construction of two additional graving docks, is expected to be close upon one million sterling. New works by the Leith Dock Commission have also been carried out at Newhaven, the well-known fishing village. On ground reclaimed from the sea a commodious fish market has been erected, and it is intended to carry the existing pier seawards into deep water, so that trawler steamers may have quay conveniences at any state of the tide. The value of fish landed at Newhaven and sold for the most part by auction in the early morning exceeds £40,000 yearly. The tonnage of the port of Leith in 1881 consisted of 189 vessels of 86,509 tons gross; in 1899 it was 207 vessels of 193,749 tons gross. The number and tonnage of vessels entering and leaving the port with cargoes and in ballast during the year ending 15th May 1881 was 8797 vessels of 1,946,052 tons. For the year ending at same date in 1899 the figures were 12,676 vessels of 3,743,140 tons. The customs revenue collected at the port in 1881 was £479,805, and in 1900, £1,096,438. The dock rates on shipping for the year to 15th May 1899 yielded £30,066; on imported goods, £35,840; and on exported goods, £15,709; total, £81,615. The Dock Commission had also a revenue from graving docks, cranes, rails, bridges, ballast, rents, fees, &c., amounting to £27,860. In 1900 the imports amounted to £12,931,781, and the exports to £5,297,990. Population (1881), 59,485; (1891), 68,707; (1901), 76,667.

Leitmeritz, an episcopal see and chief town of a district of the same name in Bohemia, Austria. Steam navigation on the Elbe begins at this town, which has an important transit trade, as well as in the products (corn, fruits, hops, and wines) of an exceptionally fertile agricultural district. The principal industries are brewing and the manufacture of malt, leather, tiles, straw hats, and flour. Population (1890), 11,342; (1900), 13,075.

Leitomischi, the chief town of a government district, Bohemia, Austria, on the right bank of the Louchna, near the Moravian frontier. It has a Renaissance château of the 16th century, and the oldest Piarist college in Bohemia. Its manufactures include linen, cloth, sugar, shoes, pianos, flour, and beer, and it has a trade in corn and flax as well as in those products. Population (1900), 8075, chiefly Czech.

Leitrim, a maritime county of Ireland, province of Connaught.

Population.—The area of the administrative county in 1900 was 376,510 acres, of which 76,879 were tillage, 216,457 pasture, 44 fallow, 3074 plantation, 20,488 turf-bog, 4070 marsh, 30,159 barren mountain, and 25,339 water, roads, fences, &c. The new administrative county, under the Local Government (Ireland) Act, 1898, is identical with the old judicial county. The population in 1881 was 90,372, and in 1891, 78,618, of whom 39,715 were males and 38,903 females, divided as follows among the different religions:—Roman Catholics, 71,098; Protestant Episcopalians, 6447; Presbyterians, 246; Methodists, 784; and other denominations, 43. The

decrease of population between 1881 and 1891 was 13·00 per cent. The average number of persons to an acre was 20, and 172 to each square mile under crops and pasture. The population in 1901 was 69,201 (Roman Catholics, 62,604; Protestant Episcopalians, 5668; Presbyterians, 224; Methodists, 685; others, 20), being a decrease of 12·0 per cent. The following table gives the degree of education in 1891:—

	Males.	Females.	Total.	Percentage.			
				R.C.	Pr.Ep.	Presb.	Meth.
Read and write	25,829	24,262	50,091	69·4	86·1	89·4	93·5
Read only	3,946	4,862	8,808	13·0	7·8	6·9	4·6
Illiterate	5,835	5,736	11,571	17·6	6·1	3·7	1·9

The percentage of illiterates among Roman Catholics in 1881 was 24·1. In 1891 there were 3 superior schools with 67 pupils (Roman Catholics 55, and Protestants 12), and 193 primary schools with 13,570 pupils (Roman Catholics 12,145, and Protestants 1425). The number of pupils on the rolls of the National schools on 31st December 1900 was 14,153, of whom 12,747 were Roman Catholics and 1406 Protestants.

The following table gives the number of births, deaths, and marriages in various years:—

Year.	Births.	Deaths.	Marriages.
1881	1951	1084	245
1891	1776	1194	302
1900	1397	1668	275

In 1900 the birth-rate per 1000 was 20·2, and the death-rate 15·4; the rate of illegitimacy was 5 per cent. of the total births. The total number of emigrants who left the county between 1st May 1851 and 31st December 1900 was 74,250, of whom 36,788 were males and 37,462 females. The only towns in the county which in 1891 had populations of over 1000 were Carrick-on-Shannon (1177) and Manor Hamilton (1061).

Administration.—The county is divided into two parliamentary divisions, North and South, the number of registered electors in 1901 being respectively 6561 and 7181. The rateable value in 1900 was £137,953, the smallest amount of any Irish county. By the Local Government (Ireland) Act, 1898, the fiscal and administrative duties of the grand jury were transferred to a county council, urban and rural district councils were established, and under that Act the county now comprises 5 rural sanitary districts.

Agriculture.—The following tables give the acreage under crops, including meadow and clover, and the amount of live stock in 1881, 1891, 1895, and 1900:—

Year.	Wheat.	Oats.	Barley, Rye, &c.	Potatoes.	Turnips.	Other Green Crops.	Meadow and Clover.	Total.
1881	806	13,750	869	19,323	943	1668	46,338	82,697
1891	37	11,687	530	16,302	1490	2376	50,113	82,535
1895	7	10,214	422	14,801	1304	1571	52,485	81,104
1900	13	8,254	389	13,441	879	2041	51,862	76,879

For 1900 the total value of the cereal and other crops was estimated at £496,762. The number of acres under pasture in 1881 was 208,644, in 1891, 209,711, and in 1900, 216,457.

Year.	Horses and Mules.	Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1881	4191	7984	84,914	11,347	19,302	6228	311,920
1891	4910	9042	95,769	20,087	27,321	9407	344,922
1895	4985	9050	91,956	17,882	27,335	9672	373,105
1900	4949	9825	98,210	17,521	25,854	9815	423,322

The number of milch cows in 1891 was 37,092, and in 1900 36,116. It is estimated that the total value of cattle, sheep, and pigs for 1900 was £1,243,741. In 1900 the number of holdings not exceeding 1 acre was 803, between 1 and 5, 883; between 5 and 15, 5154; between 15 and 30, 5229; between 30 and 50, 1817; between 50 and 100, 669; between 100 and 200, 163; between 200 and 500, 44; and above 500, 6; total, 14,768. The number of loans issued (the number of loans being the same as the number of tenants) under the Land Purchase Acts, 1885, 1891, and 1896, up to 31st March 1901, was 1649, amounting to £254,614. The number of loans for agricultural improvements, sanctioned under sec. 31 of the Land Act, 1881, between 1882 and 1901, was 625, and the amount issued was £35,084. The total amount issued on loan for all classes of works, under the Land Improvement Acts, from the commencement of operations in 1847 to 31st March 1901, was £76,506. (W. H. Po.)

Leixões, a seaport and harbour of refuge of Portugal, 3 miles north of the mouth of the Douro, being the outer port of Oporto. The harbour, which is of artificial construction, has an area of over 220 acres, and admits vessels of 5000 tons, the depth at the entrance being nearly 50 feet. The port is in the commune of Matosinhos, which in 1900 had a population of 7680.

Leland, Charles Godfrey (1824—), American author, son of a merchant, was born at Philadelphia, 15th August 1824, and educated at Princeton, where he graduated in 1846. He went to Europe, and studied at Heidelberg, Munich, and Paris. He was at Paris during the revolution of 1848, and took an active part in it. He then returned to Philadelphia, and after being admitted to the bar in 1851, devoted himself to contributing to periodicals, editing various magazines, and writing books. At the opening of the Civil War he started at Boston the *Continental Magazine*, which advocated the emancipation of the slaves. In 1868 he became known as the humorous author of *Hans Breitmann's Ballads* (1867–70), the work with which his name will be substantially associated. These dialect poems, burlesquing the German American, at once became popular. In 1869 he left America for Europe, and till 1880 was occupied, chiefly in London, with literary work, and after returning to Philadelphia for six years in 1880, he again made his home in Europe, chiefly at Florence. Though his humorous verses were most attractive to the public, Leland interspersed his lighter work with the serious study of folk-lore, particularly of the gypsies, his writings on the latter (*English Gypsies*, 1872; *The Gypsies*, 1883; *Gypsy Sorcery*, 1891, &c.) being recognized as invaluable contributions to the literature of the subject.

Lemberg (Polish *Lwów*), the capital of the Austrian crownland of Galicia, and now, according to its population, the fifth city of the Dual Monarchy (after Vienna, Budapest, Prague, and Trieste) and the fourth of Austria. The population in 1890 was 127,943; in 1900, 159,618 (Poles estimated at 82 per cent., Germans 10 per cent., and Ruthenians 8 per cent.; 52·6 per cent. Roman Catholic, 17 per cent. Greek Catholic, 28·4 per cent. Jewish, and 2 per cent. Protestant). Its garrison comprises 10,326 men. It is the seat of a Roman Catholic, a Greek, and an Armenian archbishop, and has 14 Roman Catholic churches, a Greek church, an Armenian church, and a Protestant church, two synagogues and 11 Hebrew houses of prayer, together with numerous Catholic and Greek religious communities, including 11 convents. In addition to the university (with over 100 professors and 2058 students in 1901), in which Polish has been the language of instruction since 1871, educational requirements are provided for by a polytechnic (711 students in 1901), a Roman Catholic, and a Greek Catholic theological seminary, 5 gymnasia, a *realschule*, 2 training colleges, and 5 other technical and special schools. Its industries now include the manufacture of machinery and iron wares, matches, stearin candles and naphtha, arrack and liqueurs, chocolate, chicory, leather, and plaster of Paris, as well as brewing, corn-milling, and brick and tile making. It has important commerce in linen, flax, hemp, wool, and seeds, and a considerable transit trade. It appears, from the statistics published by the municipal authorities, that the Jewish element is chiefly responsible for the large proportion of illegitimate births. In 1892 there were 1944 legitimate and 585 illegitimate Roman Catholic births, as compared with 489 legitimate and 938 illegitimate Jewish births, a ratio which roughly agrees with that prevailing at Cracow. From 350 to 400 children are annually legitimized.

Lemgo, a town of Germany, principality of Lippe, 58 miles by rail south-west of Hanover. It has several old gable-ended houses of the 15th century, a church rebuilt in 1290, a town hall (1589), and several religious and philanthropic institutions, as well as production of meerschaum pipes, cigars, and woollens. Lemgo once belonged to the Hanseatic League. Population (1885), 6443; (1900), 8840.

Lemnos, a historic island of the Ægean Sea, chief town of a sanjak of Turkey and the seat of a Greek bishop with jurisdiction over Lemnos and Aghios Strati. The valleys are fertile, and on the heights there is good grazing for sheep and goats. The chief exports are barley, sesame, cheese, and wool. Population, 27,079, mostly Greeks.

Lemoine, John (1815–1892), French journalist, was born, of French parents, in London, 17th October 1815, and educated first at an English school and then in France. In 1846 he began writing for the *Journal des Débats* on English and other foreign questions, and under the Empire his brilliant pen was actively employed in holding up to admiration the free institutions of England by contrast with Imperial methods. He became one of the most influential writers in Paris. After 1871 he supported Thiers, but his sympathies rather tended towards a Liberalized monarchy, until the comte de Chambord's policy made such a development an impossibility, and he then ranged himself with the Moderate Republicans. In 1875 John Lemoine was elected to the French Academy, and in 1880 he was nominated a life senator. Distinguished though he was for a real knowledge of England among the French journalists who wrote on foreign affairs, his tone towards English policy greatly changed in later days, and though he never shared the extreme French bitterness against England as regards Egypt, he maintained a critical attitude towards Great Britain which served to stimulate French Anglophobia. He was a frequent contributor to the *Revue des Deux Mondes*, and published several books, the best known of which is his *Études Critiques* (1862). He died in Paris 14th December 1892.

Lemur.—Important advances in our knowledge of the extinct members of this group have been made. In the first place, the French *Necrolemur* (*Ency. Brit.* vol. xiv. p. 444) has been identified generically with *Microchoerus* of the Hampshire Tertiaries. Secondly, *Adapis* (*l.c.*) has been proved to be a true lemur, closely related in the structure of the tympanic region of the skull to the Malagasy lemurs, and thereby different from the African galagos. In the North American Eocene lemurs are represented by *Anaptomorphus*, now known to have large eye-sockets and triangular upper molars of the tritubercular type. But the most important discoveries have been made in the superficial deposits of Madagascar. *Megaladapis*, of which two species are known, is the largest of all lemurs. The skull is distinguished by its elongation and the small size of the eye-sockets, the upper molars approximating to the tritubercular type, and presenting considerable resemblance to those of the living *Lepidolemur*. The brain is of a remarkably low type. In one species the approximate length of the skull is 250, and in the second 330 millimetres. Even more interesting are the two large species of *Nesopithecus*, which are likewise from Madagascar, and one of which was at first described as *Globilemur*. They show a very complicated type of brain, and were at first regarded as indicating Malagasy representatives of the Anthropoidea. In regard to the character of the tympanic region of the skull, this genus shows several features characteristic of the more typical Malagasy lemuroids; and the eye-sockets are

open behind, while the dentition is numerically the same as in some of the latter. On the other hand, in several features *Nesopithecus* resembles the Anthropoidea; the upper incisors are not separated in the middle line, and the upper molars present the pattern found in the *Cercopithecidae*. The resemblances to apes are not confined to the skull, but are found in almost all the bones. Probably the genus may be regarded as a specialized lemuroid.

Lenbach, Franz von (1836—), German painter, was born at Schrobenhausen, in Bavaria, on 13th December 1836. His father was a mason, and the boy was intended to follow his father's trade or be a builder. With this view he was sent to school at Landsberg, and then to the polytechnic at Augsburg. But after seeing one day Hofner, the animal painter, executing some studies, he made various attempts at painting, which his father's orders interrupted. However, when he had seen the galleries of Augsburg and Munich, he finally obtained his father's permission to become an artist, and worked for a short time in the studio of Gräffe, the painter; after this he devoted much time to copying. Thus he was already accomplished in technique when he became the pupil of Piloty, with whom he set out for Italy in 1858. A few interesting works remain as the outcome of this first journey—"A Peasant seeking Shelter from Bad Weather" (1855), "The Goatherd" (1860, in the Schack Gallery, Munich), and "The Arch of Titus" (in the Palfy collection, Budapest). On returning to Munich, he was at once called to Weimar to take the appointment of professor at the Academy, and there he became the friend of Begas, the sculptor, and of Böcklin. But he did not hold it long, having made the acquaintance of Count Schack, who commissioned him to paint a great number of copies for his collection. Lenbach returned to Italy the same year, and there copied Titian's "Sacred and Profane Love," his "Venus" in the Tribuna, and many other famous pictures. After copying, at Munich, Van Dyck's "Lady playing the Violoncello," he set out in 1867 for Spain. There he copied not only the famous pictures by Velasquez in the Prado, but also some landscapes in the museums of Granada and the Alhambra (1868), now in the Schack Gallery. In the previous year he had exhibited at the great Exhibition at Paris several portraits, one of which took a third-class medal. In 1878 he exhibited the "Portrait of Canon Döllinger." Lenbach exhibited frequently both at Munich and at Vienna, and in 1900 at the Paris Exhibition was awarded a Grand Prix for painting. He has painted many of the most remarkable personages of his time; for instance, the king of Bavaria, the empress of Austria, the queen of Italy, the Emperor William I., Frederick III., the Emperor William II., Bismarck (*q.v.*), Moltke, Gladstone, Böcklin, Stuck, Liszt, Wagner, Bülow, Andrassy, Count Schack (1870 and 1875), and Pope Leo XIII.

Lenormant, François (1837–1883), Assyriologist and archæologist, was born in Paris on 17th January 1837. His father, Charles Lenormant, distinguished as an archæologist, numismatist, and Egyptologist, was anxious that his son should follow in his steps. He made him begin Greek at the age of six, and the child responded so well to this precocious scheme of instruction, that when he was only fourteen an essay of his, on the Greek tablets found at Memphis, appeared in the *Revue Archéologique*. In 1856 he won the numismatic prize of the Académie des Inscriptions with an essay entitled

Classification des Monnaies des Lagides. In 1862 he became sub-librarian of the Institute. In 1859 he accompanied his father on a journey of exploration to Greece, an expedition destined to end sadly, for Charles Lenormant succumbed to fever at Athens (24th November). In spite of this unhappy event, Lenormant returned to Greece three times during the next six years, and gave up all the time he could spare from his official work to archæological research. These peaceful labours were rudely broken into by the war of 1870, when Lenormant served with the army and was wounded in the siege of Paris. In 1874 he was appointed professor of archæology at the National Library, and in the following year he collaborated with Baron de Witte in founding the *Gazette Archéologique*. As early as 1867 he had turned his attention to Assyrian studies, and was among the first to recognize in the cuneiform inscriptions the existence of a non-Semitic language, now known as Accadian. Lenormant's knowledge was of encyclopædic extent, ranging over an immense number of subjects, and at the same time thorough, though somewhat lacking perhaps in the strict accuracy of the modern school. Most of his varied studies were directed towards tracing the origins of the two great civilizations of the ancient world, which were to be sought in Mesopotamia and on the shores of the Mediterranean. He had a perfect passion for exploration. Besides his early expeditions to Greece, he visited the south of Italy three times with this object, and it was while exploring in Calabria that he met with an accident which ended fatally in Paris on 9th December 1883, after a long illness. The amount and variety of Lenormant's work is truly amazing when it is remembered that he died at the early age of forty-six. Probably the best known of his books are *Les Origines de l'histoire d'après la Bible*, and his ancient history of the East and account of Chaldean magic. For breadth of view, combined with extraordinary subtlety of intuition, he was probably unrivalled.

(A. Z.)

Lenox, a town of Berkshire county, Massachusetts, U.S.A., containing an area of 22 square miles of hill country. The principal village in the town, of the same name as the town, is at an altitude of 1200 feet, and about it are high hills—Yokun Seat (2080 feet), South Mountain (1870 feet), Bald Head (1583 feet), and Rattlesnake Hill (1540 feet). Lenox contains the summer houses of many wealthy and prominent persons. The village is principally built along the main street, but the villas are scattered over the surrounding hills in all directions, with fine carriage roads to and among them. The season is in the fall of the year, when outdoor amusements, such as horse-racing, golf, tennis, and polo, are rife. Population (1880), 2043; (1890), 2889; (1900), 2942.

Lens, town, arrondissement of Béthune, department of Pas-de-Calais, France, 12 miles south-east of Béthune by rail, on the Lens canal. It has important iron and steel foundries and forges, and manufactories of steel cables, and occupies a central position in the coalfields of the department, which produced in 1900, 14,594,575 tons of coal. Population (1881), 10,487; (1891), 13,730; (1901), 24,370. Two and a half miles west-south-west lies LIÉVIN, likewise a centre of the coalfield, with a traffic in 1900 of 289,721 tons. Population (1881), 8281; (1891), 11,704; (1901), 17,600.

Lentini (the ancient *Leontini*), a town of the province of Syracuse, Sicily, Italy, 36 miles by rail north-north-west of Syracuse, on a hill $1\frac{1}{2}$ miles south-east of the marshy lake Lentini or Biviere. This lake is about 20 miles in circumference, and generally thronged with water-birds, and full of eels, mullet, &c. The town manufactures pottery, and produces cheese, lime, and olive oil, and has a technical

school. Lentini and its citadel were almost entirely destroyed by an earthquake in 1693. Population (1881), 12,740; (1899), 11,000. About one mile to the south-east and higher up lies the town of CARLENTINI, founded by Charles V., but greatly injured by the earthquake of 1693. Population (1881), 6530; (1897), 5500.

Leo XIII. [VINCENT JOACHIM RAPHAEL LEWIS PECCI] (1810—), Pope, reckoned the 257th successor of St Peter, was born at Carpineto, 2nd March 1810. His family was Sienese in origin, and his father had served in the army of Napoleon. His earliest education he received from the Jesuits at Viterbo and in Rome. In the jubilee year 1825 he was selected by his fellow-students to head a deputation to Pope Leo XII., whose memory he subsequently cherished and whose name he assumed in 1878. Weak health, consequent on over-study, prevented him from obtaining the highest academical honours, but he graduated as doctor in theology at the age of twenty-two, and then entered the "Accademia," a college in which clergy of aristocratic birth are trained for the diplomatic service of the Roman Church. Two years later Gregory XVI. appointed him a domestic prelate, and bestowed on him, by way of apprenticeship, various minor administrative offices in the pontifical State. He was ordained priest 31st December 1837, and a few weeks later was made governor of Benevento, where he had to deal with brigands and smugglers, who enjoyed the protection of some of the noble families of the district. His success here led to his appointment in 1841 as governor of Perugia, which was at that time a centre of anti-papal secret societies. This post he held for eighteen months only, but in that brief period he obtained a reputation as a social and municipal reformer. In 1843 he was sent as Nuncio to Brussels, being first consecrated a bishop (19th February), with the title of archbishop of Damietta. During his three years' residence at the Belgian capital he gained the esteem of Leopold I. and was presented to Queen Victoria of England and the Prince Consort. He also made the acquaintance of many Englishmen, Archbishop Whately among them. In January 1846, at the request of the magistrates and people of Perugia, he was appointed bishop of that city; but before returning to Italy he spent the month of February in London (where he was present at one of Lord Palmerston's receptions), and the months of March and April in Paris. On his arrival in Rome he would, at the request of King Leopold, have been created cardinal but for the death of Gregory XVI. Seven years later, 19th December 1853, he received the red hat from Pius IX. Meanwhile, and throughout his long episcopate of thirty-two years, he foreshadowed the zeal and the enlightened policy later to be displayed in the prolonged period of his pontificate, building and restoring many churches, striving to elevate the intellectual as well as the spiritual tone of his clergy, and showing in his pastoral letters an unusual regard for learning and for social reform. His position in Italy was similar to that of Bishop Dupanloup in France; and, as but a moderate supporter of the policy enunciated in the Syllabus, he was not altogether *persona grata* to Pius IX. But he protested energetically against the loss of the Pope's temporal power in 1870, against the confiscation of the property of the religious orders, and against the law of civil marriage established by the Italian Government, and he refused to welcome Victor Emmanuel in his diocese. Nevertheless, he remained in the comparative obscurity of his episcopal see until the death of Cardinal Antonelli; but in 1877, when the important papal office of Camerlengo became vacant, Pius IX. appointed to it Cardinal Pecci, who thus returned to reside in Rome, with the prospect of having shortly responsi-

ble functions to perform during the vacancy of the Holy See, though the Camerlengo was traditionally regarded as disqualified by his office from succeeding to the papal throne.

When Pius IX. died (7th February 1878) Cardinal Pecci was elected Pope at the subsequent Conclave with comparative unanimity, obtaining at the third scrutiny (20th February) forty-four out of sixty-one votes, or more than the requisite two-thirds majority. The Conclave was remarkably free from political influences, the attention of Europe being at the time engrossed by the presence of a Russian army at the gates of Constantinople. It was said that the long pontificate of Pius IX. led some of the cardinals to vote for Pecci, since his age (within a few days of sixty-eight) and health warranted the expectation that his reign would be comparatively brief; but he had for years been known as one of the few "Papable" cardinals; and although his long seclusion at Perugia had caused his name to be little known outside Italy, there was a general belief that the Conclave had selected a man who was a prudent statesman as well as a devout churchman; and Newman (whom he created a cardinal in the year following) is reported to have said, "In the successor of Pius I recognize a depth of thought, a tenderness of heart, a winning simplicity, and a power answering to the name of Leo which prevent me from lamenting that Pius is no longer here."

The second day after his election Pope Leo XIII. crossed the Tiber *incognito* to his former residence in the Falconieri Palace to collect his papers, returning at once to the Vatican, where he continued to regard himself as "imprisoned" so long as the Italian Government occupied the city of Rome. He was crowned in the Sistine Chapel 3rd March 1878, and at once began a reform of the papal household on austere and economic lines which found little favour with the *entourage* of the former Pope. To fill posts near his own person he summoned certain of the Perugian clergy who had been trained under his own eye, and from the first he was less accessible than his predecessor had been, either in public or private audience. Externally uneventful as his life henceforth necessarily was, it was marked chiefly by the reception of distinguished personages and of numerous pilgrimages, often on a large scale, from all parts of the world, and by the issue of encyclical letters. The stricter theological training of the Roman Catholic clergy throughout the world on the lines laid down by St Thomas Aquinas was his first care, and to this end he founded in Rome and endowed an academy bearing the great schoolman's name, further devoting about £12,000 to the publication of a new and splendid edition of his works, the idea being that on this basis the later teaching of Catholic theologians and many of the speculations of modern thinkers could best be harmonized and brought into line. The study of Church history was next encouraged, and in August 1883 the Pope addressed a letter to Cardinals De Luca, Pitra, and Hergenröther, in which he made the remarkable concession that the Vatican archives and library might be placed at the disposal of persons qualified to compile manuals of history. His belief was that the Church would not suffer by the publication of documents. A man of literary taste and culture, familiar with the classics, a facile writer of Latin verses as well as of Ciceronian prose, he was as anxious that the Roman clergy should unite human science and literature with their theological studies as that the laity should be educated in the principles of religion; and to this end he established in Rome a kind of voluntary School Board, with members both lay and clerical; and the rivalry of the schools thus founded ultimately obliged the State to include religious teaching in their curriculum. The numerous encyclicals by which the pontificate of Leo XIII.

will always be distinguished were prepared and written by himself, but were submitted to the customary revision. His first (4th August 1879) was on the scholastic philosophy. In later ones, working on the principle that the Christian Church should superintend and direct every form of civil life, he dealt with the Christian Constitution of States (1st November 1895), with Human Liberty (20th June 1888), and with the Condition of the Working Classes (15th May 1891).

This last, entitled *Rerum novarum*, was slightly tinged with modern socialism; it was described as "the social Magna Charta of Catholicism," and it won for him the name of "the workingman's Pope." Translated into the chief modern languages, many thousands of copies were circulated among the working classes in Catholic countries. Other encyclicals, such as those on Christian Marriage (10th February 1880), on the Rosary (1st September 1883, and again 5th September 1898), and on Freemasonry (20th April 1884), dealt with subjects on which his predecessor had been accustomed to pronounce allocutions, and were on similar lines. It was the knowledge that in all points of religious faith and practice Leo XIII. stood precisely where Pius IX. had stood that served to render ineffectual others of his encyclicals, in which he dealt earnestly and effectively with matters in which orthodox Protestants had a sym-

pathetic interest with him and might otherwise have lent an ear to his counsels. Such were the letters on the Study of Holy Scripture (18th November 1893), and on the Reunion of Christendom (20th June 1894). He showed special anxiety for the return of England to the Roman Catholic fold, and addressed a letter *ad Anglos*, dated 14th April 1894. This he followed up by an encyclical entitled *Satis Cognitum*, on the Unity of the Church (29th June 1896); and the question of the validity of Anglican ordinations from the Roman Catholic point of view having been raised in Rome by Viscount Halifax, with whom the Abbé Duchesne and one or two other French priests were in sympathy, a commission was appointed to consider the subject, and on 15th

September 1896 a condemnation of the Anglican form as theologically insufficient was issued, and was directed to be taken as final.

The establishment of a diocesan hierarchy in Scotland had been decided upon before the death of Pius IX., but the actual announcement of it was made by Leo XIII. On 25th July 1898 he addressed to the Scottish Catholic bishops a letter, in the course of which he said that "many of the Scottish people who do

not agree with us in faith sincerely love the name of Christ and strive to ascertain His doctrine and to imitate His most holy example." The Irish and American bishops he summoned to Rome to confer with him on the subjects of Home Rule and of "Americanism" respectively. In India he established a diocesan hierarchy, with seven archbishoprics, the archbishop of Goa taking precedence with the rank of Patriarch.

With the Government of Italy his general policy was to be as conciliatory as was consistent with his oath as Pope never to surrender the "patrimony of St Peter"; but a moderate attitude was rendered difficult by partisans on either side in the press, each of whom claimed to represent his views. In 1879, addressing a congress of Catholic journalists in Rome, he exhorted them to uphold the necessity of the temporal power, and to proclaim to the world that the affairs of Italy would never

POPE LEO XIII.

prosper until it was restored; in 1887 he found it necessary to deprecate the violence with which this doctrine was advocated in certain journals. A similar counsel of moderation was given to the Canadian press in connexion with the Manitoba school question in December 1897. The less conciliatory attitude towards the Italian Government was resumed in an encyclical addressed to the Italian clergy (5th August 1898), in which he insisted on the duty of Italian Catholics to abstain from political life while the Papacy remained in its "painful, precarious, and intolerable position." And in January 1902, reversing the policy which had its inception in the encyclical, *Rerum novarum*, of 1891, and had further been developed ten

years later in a letter to the Italian bishops entitled *Graves de communi*, the "Sacred Congregation of Extraordinary Ecclesiastical Affairs" issued instructions concerning "Christian Democracy in Italy," directing that the popular Christian movement, which embraced in its programme a number of social reforms, such as factory laws for children, old-age pensions, a minimum wage in agricultural industries, an eight-hours' day, the revival of trade guilds, and the encouragement of Sunday rest, should divert its attention from all such things as savoured of novelty and devote its energies to the restoration of the temporal power. The reactionary policy thus indicated gave the impression that a similar aim underlay the appointment about the same date of a commission to inquire into Biblical studies; and in other minor matters Leo XIII. disappointed those who had looked to him for certain reforms in the devotional system of the Church. A revision of the breviary, which would have involved the omission of some of the less credible legends, came to nothing, while the recitation of the office in honour of the Santa Casa at Loreto was imposed on all the clergy. The worship of Mary, largely developed during the reign of Pius IX., received further stimulus from Leo; nor did he do anything during his pontificate to correct the superstitions connected with popular beliefs concerning relics and indulgences.

His policy towards all governments outside Italy was to support them wherever they represented social order; and it was with difficulty that he persuaded French Catholics to be united in defence of the Republic. In 1885 he successfully arbitrated between Germany and Spain in a dispute concerning the Caroline Islands. In Ireland he condemned the "Plan of Campaign," but he conciliated the Nationalists by appointing Dr Walsh archbishop of Dublin. His hope that his support of the British Government in Ireland would be met by the establishment of formal diplomatic relations between the Court of St James's and the Vatican was disappointed. But the jubilee of Queen Victoria in 1887 and the Pope's priestly jubilee a few months later were the occasion of friendly intercourse between Rome and Windsor, Mgr. Ruffo Scilla coming to London as special papal envoy, and the duke of Norfolk being received at the Vatican as the bearer of the congratulations of the queen of England. Similar courtesies were exchanged during the jubilee of 1897, and again in March 1902, when Edward VII. sent the Earl of Denbigh to Rome to congratulate Leo XIII. on reaching his ninety-third year and the twenty-fifth year of his pontificate.

The elevation of Newman to the College of Cardinals in 1879 was regarded with approval throughout the English-speaking world, both on Newman's account and also as evidence that Leo XIII. had a wider horizon than his predecessor; and his similar recognition of two of the most distinguished "inopportunist" members of the Vatican Council, Haynald, archbishop of Kalocsa, and Prince Fürstenberg, archbishop of Olmütz, was even more noteworthy. Dupanloup would doubtless have received the same honour had he not died shortly after Leo's accession. Dollinger he attempted to reconcile, but failed. An Armenian schism was healed by him, and he laboured much to bring about the reunion of the Oriental Churches with the see of Rome, establishing Catholic educational centres in Athens and in Constantinople with that end in view. He used his influence with the Tsar, as also with the emperors of China and Japan and with the shah of Persia, to secure the free practice of their religion for Roman Catholics within their respective dominions. Among the canonizations and beatifications of his pontificate that of Sir Thomas More, author of the *Utopia*, is memorable. His encyclical issued at Easter 1902,

and described by himself as a kind of will, was mainly a reiteration of earlier condemnations of the Reformation, and of modern philosophical systems, which by their atheism and materialism are responsible for all existing moral and political disorders. Society, he earnestly pleaded, can only find salvation by a return to Christianity and to the fold of the Roman Catholic Church.

The personal appearance of Leo XIII. in his later years is thus described by Mr Thaddeus, who painted his portrait:—"Pope Leo XIII. is of medium height. His attenuated figure is bent by study and the weight of years, but in every movement he is astonishingly quick and energetic. His head is a most remarkable one, once seen never to be forgotten, with its every feature out of strict proportion, yet with the harmony of the whole. The small, bright, rapid eyes, set close together, denote the man who is ever on the search; the largely developed aquiline nose a capacity for domination. The mouth, when under a pleasing influence, forms into an exceedingly wide, sweet smile, its benevolent expression brightening the whole face, and supplying the benignity which is less observable in the eyes. . . . The skin is so thin that a perfect network of blue veins is visible over all the white ascetic face. He is gifted with the fire and the impulses of youth, without its accompanying physical strength." Grave and serious in manner, speaking slowly, but with energetic gestures, simple and abstemious in his life,—his daily bill of fare being reckoned as hardly costing a couple of francs,—he distributed large sums in charity, and at his own charges placed costly astronomical instruments in the Vatican Observatory, providing also accommodation and endowment for a staff of officials. He always showed the greatest interest in science and in literature, and he would have taken a position as a statesman of the first rank had he held office in any secular government. He may be reckoned the most illustrious Pope since Benedict XIV., and under him the papacy acquired a prestige unknown since the Middle Ages.

Leoben, an old mining town, situated on a peninsula formed by the Mur river in Styria, Austria. Part of its old walls and towers still remain. It has a well-known academy of mining and a number of technical schools. Its extensive iron-works and trade in iron are a consequence of its position on the verge of the important lignite deposits of Upper Styria and in the neighbourhood of the iron mines and furnaces of Vordernberg and Eisenerz, with which it is connected by railway. The preliminary peace concluded at Leoben between Austria and France on the 18th of April 1797 is commemorated by a monument. Population (1890), 8127; (1900), 10,204.

Leominster, a municipal borough and market town in the Leominster parliamentary division (since 1885) of Herefordshire, England, 12 miles north of Hereford by rail. A free library has been erected. The district is rich in orchards, hop gardens, and agricultural land, and there are cider works in the town. Area of borough, 8284 acres. Population (1891), 5675; (1901), 5826.

Leominster, a town of Worcester county, Massachusetts, U.S.A., in a broken, hilly region, crossed by the New York, New Haven, and Hartford railroad. The principal village in the town bears the same name as the town, and is on the Nashua river. It has some manufactures of various kinds. Population (1880), 5772; (1890), 7269; (1900), 12,392, of whom 2827 were foreign-born.

Leon, an inland province in the north-west of Spain.

It is divided into 10 administrative districts and 234 parishes, covering 6166 square miles. The population was 384,197 in 1897, the average birth-rate being 3.89 per cent., the death-rate 3.11 per cent., and the proportion of illegitimate births 4.69 per cent. The main railway line from Madrid to Corunna passes through the province. From Leon City a branch runs to Oviedo, and to Gijon on the north coast, with a sub-branch to Vierzo. The chief exports are cattle, mules, iron, leather, coal, and butter.

The province is very rich in mines, but only 53 (51 coal) are worked, while 418 are unproductive. The coal-mines developed considerably towards the end of the 19th century, and employ more than a thousand hands. Five companies had an output in 1898 of 144,700 tons of coal and 29,230 tons of coke, besides 40,500 tons of anthracite. In 1898 the live stock included 9623 horses, 3056 mules, 16,220 asses, 159,604 cattle, 452,320 sheep, 26,584 pigs, and 108,127 goats. Agriculture is important, 136,135 acres being devoted to wheat, 312,552 to rye, oats, barley, and maize, 9200 to pod fruit, 51,407 to vines, and 3500 to garbanzos or chick-pea.

Leon, the capital of the above province, had a population of 15,300 in 1897. About the middle of the 19th century it seemed to be decaying fast, but a revival has set in. The churches and convents have been repaired, especially the noble cathedral, the restoration of which took ten years. The local industries, particularly those connected with chemicals, leather, foundries, machinery, and railway rolling and fixed stock, have much developed, as has also the trade in agricultural products. The new town has spread beyond the dilapidated walls of the Roman and mediæval boundaries. Leon has an institute, seminaries, and handsome municipal buildings and hospitals.

Leon, chief town of a province of Nicaragua, Central America, on the railway from Corinto to Lake Managua, 50 miles north-west of Managua. Until 1855 Leon was the capital of Nicaragua, and suffered severely in the civil wars; but owing largely to the advantage of railway communication, it has recovered much of its prosperity. Besides a large general trade, it has several extensive tanneries, which supply cheap leather for export. Population, about 34,000, or including that of the large Indian suburb of Subtiaba, from which the modern town had its origin, about 45,000.

Léonard, Hubert (1819–1890), Belgian violinist and teacher, was born at Bellaine on 7th April 1819. He studied under Habeneck at the Paris Conservatoire, gave concerts in the principal towns of Europe, and succeeded de Bériot as professor of the violin at the Brussels Conservatoire in 1851. It is especially as a teacher that Léonard acquired fame. He wrote a great deal for his instrument, and his published works include six concertos, studies, fantasias, &c., besides many duets in collaboration with Litolf, Grégoire, and Servais. He died in Paris, 6th May 1890.

Leonforte, a town of the province of Catania, Sicily, Italy, 52 miles west by north of Catania (49 miles by rail). It has sulphur-mines and flour mills. Altitude, 3400 feet above sea-level. Population (1881), 15,645; (1897), 15,000.

Leopold II. (LEOPOLD LOUIS PHILIPPE MARIE VICTOR), king of the Belgians (1835—), son of King Leopold I. and Princess Louise, daughter of Louis Philippe, king of the French, was born at Brussels, 9th April 1835. In 1846 he was created duke of Brabant and appointed a sub-lieutenant in the army, in which he

served until his accession, by which time he had reached the rank of lieutenant-general. On attaining full age he was made a member of the Senate, and distinguished himself by the keen interest he took in its proceedings, and especially in those which concerned the development of Belgium and its trade. On 22nd August 1853 he married Marie Henrietta, daughter of the late Archduke Joseph of Austria, and after making a tour round the chief towns of Belgium, the young duke and duchess travelled, in 1854–55, through Italy and Austria to Egypt, Palestine, and Greece. In 1860 the duke visited Constantinople, which, owing to the Crimean war, had necessarily been omitted from the programme in 1855; and two years later he went to Spain and Morocco, after spending a few days on the south coast of England. In the autumn of the same year he paid a second visit to Egypt, this time *via* Algiers and Tunis, and, proceeding to Mount Sinai, did not return to Brussels until June 1863. In the following year he made the most distant and most notable of his numerous journeys, visiting China and India. He returned in 1865 through London, in order to tender special thanks to Queen Victoria and the British Government for the courtesies received throughout the British dominions in Asia. On the death of his father, 10th December 1865, he succeeded to the crown as Leopold II., and on 28th January 1869 their majesties lost their only son, the Crown Prince Leopold, whereupon the king's brother, Philip, count of Flanders, became heir to the throne. During the Franco-Prussian war King Leopold preserved a strict and honourable neutrality in a period of unusual difficulty and danger. But the most notable and far-reaching event in his career was the foundation of the Congo Free State. While still duke of Brabant, Leopold II. was the first to call the attention of the Belgians to the need of enlarging their horizon beyond sea, and as king he gave the first impulse towards the development of this idea, by founding in 1876 the Association Internationale Africaine. This was followed in 1878 by the formation of the Comité d'Études du Haut-Congo, which in its turn developed into the Congo Free State. The history of these transactions, from 1878 to 1884, is given by Sir H. M. Stanley in *The Congo and the Founding of its Free State* (1885), which contains a full account of Stanley's explorations made under commission from King Leopold, who contributed £50,000 from his privy purse towards the expenses. It was in this connexion that King Leopold sought an interview with General Gordon in 1880, and obtained his promise, subject to the approval of the War Office, to enter the Belgian service on the Congo. Three years later his majesty claimed fulfilment of the promise, and Gordon was about to proceed to the Congo when the British Government claimed his services for the Sudan. An excellent linguist, King Leopold was also an ardent traveller, and a patron of art, literature, and science; he founded in 1874 a yearly prize of 25,000 francs for the best work on a given subject announced five years in advance. As duke of Brabant he held aloof from politics, and after his accession he followed the strict constitutional line to which his father always adhered.

Leprosy is now included among the parasitic diseases. The cause is believed to be infection by the bacillus lepræ, a specific microbe discovered by Hansen in 1871. This organism, which closely resembles the tubercle bacillus, is always found associated with leprosy, but all attempts to cultivate it and to produce the disease by experimental inoculation have failed or met with doubtful success. The proof of causation is, therefore, still incomplete. It is worthy of note that tuberculosis is very common among lepers, and especially attacks the serous

membranes. The essential character of leprosy is a great multiplication of cells, resembling the "granulation cells" of lupus and syphilis, in the tissues affected, which become infiltrated and thickened, with degeneration and destruction of their normal elements. The new cells vary in size from ordinary leucocytes to giant cells three or four times larger. The bacilli are found in these cells, sometimes in small numbers, sometimes in masses. The structures most affected are the skin, nerves, mucous membranes, and lymphatic glands.

The symptoms arise from the anatomical changes indicated, and they vary according to the parts attacked. Three types of disease are usually described—(1) nodular, (2) smooth or anæsthetic, (3) mixed. In the first the skin is chiefly affected, in the second the nerves; the third combines the features of both. It should be understood that this classification is purely a matter of convenience, and is based on the relative prominence of symptoms, which may be combined in all degrees. The incubation period of leprosy—assuming it to be due to infection—is unknown, but cases are on record which can only be explained on the hypothesis that it may be many years. The invasion is usually slow and intermittent. There are occasional feverish attacks, with the usual constitutional disturbance and other slight premonitory signs, such as changes in the colour of the skin and in its sensibility. Sometimes, but rarely, the onset is acute and the characteristic symptoms develop rapidly. These begin with an eruption which differs markedly according to the type of disease. In the nodular form dark red or coppery patches appear on the face, backs of the hands, and feet, or on the body; they are generally symmetrical, and vary from the size of a shilling upwards. They come with one of the feverish attacks and fade away when it has gone, but only to return. After a time infiltration and thickening of the skin become noticeable, and the nodules appear. They are lumpy excrescences, at first pink but changing to brown. Thickening of the skin of the face produces a highly characteristic appearance, recalling the aspect of a lion. The tissues of the eye undergo degenerative changes; the mucous membrane of the nose and throat is thickened, impairing the breathing and the voice; the eyebrows fall off; the ears and nose become thickened and enlarged. As the disease progresses the nodules tend to break down and ulcerate, leaving open sores. The patient, whose condition is extremely wretched, gradually becomes weaker, and eventually succumbs to exhaustion or is carried off by some intercurrent disease, usually inflammation of the kidneys or tuberculosis. A severe case may end fatally in two years, but as a rule when patients are well cared for the illness lasts several years. There is often temporary improvement, but complete recovery from this form of leprosy rarely or never occurs. The smooth type is less severe and more chronic. The eruption consists of patches of dry, slightly discoloured skin, not elevated above the surface. These patches are the result of morbid changes affecting the cutaneous nerves, and are accompanied by diminished sensibility over the areas of skin affected. At the same time certain nerve trunks in the arm and leg, and particularly the ulnar nerve, are found to be thickened. In the further stages the symptoms are those of increasing degeneration of the nerves. Bullæ form on the skin, and the discoloured patches become enlarged; sensation is lost, muscular power diminished, with wasting, contraction of tendons, and all the signs of impaired nutrition. The nails become hard and clawed; perforating ulcers of the feet are common; portions of the extremities, including whole fingers and toes, die and drop off. Later, paralysis becomes more marked, affecting the muscles of the face and

limbs. The disease runs a very chronic course, and may last twenty or thirty years. Recovery occasionally occurs. In the mixed form, which is probably the most common, the symptoms described are combined in varying degrees. Leprosy may be mistaken for syphilis, tuberculosis, ainhum (an obscure disease affecting negroes, in which the little toe drops off), and several affections of the skin. Diagnosis is established by the presence of the bacillus lepræ in the nodules or bullæ, and by the signs of nerve degeneration exhibited in the anæsthetic patches of skin and the thickened nerve trunks.

In former times leprosy was often confounded with other skin diseases, especially psoriasis and leucoderma; the white leprosy of the Old Testament was probably a form of the latter. But there is no doubt that true leprosy has existed from time immemorial. Prescriptions for treating it have been found in Egypt, to which a date of about 4600 B.C. is assigned. The disease is described by Aristotle and by later Greek writers, but not by Hippocrates, though leprosy derives its name from his "lepra" or "scaly" disease, which was no doubt psoriasis. In ancient times it was widely prevalent throughout Asia as well as in Egypt, and among the Greeks and Romans. In the Middle Ages it became extensively diffused in Europe, and in some countries—France, England, Germany, and Spain—every considerable town had its leper-house, in which the patients were segregated. The total number of such houses has been reckoned at 19,000. The earliest one in England was established at Canterbury in 1096, and the latest at Highgate in 1472. At one time there were at least 95 religious hospitals for lepers in Great Britain and 14 in Ireland (Sir James Simpson). During the 15th century the disease underwent a remarkable diminution. It practically disappeared in the civilized parts of Europe, and the leper-houses were given up. It is a singular fact that this diminution was coincident with the great extension of syphilis (see PROSTITUTION). The general disappearance of leprosy at this time is the more unintelligible because it did not take effect everywhere. In Scotland the disease lingered until the 19th century, and in some other parts it has never died out at all. At the present time it still exists in Norway, Iceland, along the shores of the Baltic, in South Russia, Greece, Turkey, several Mediterranean islands, the Riviera, Spain, and Portugal. Isolated cases occasionally occur elsewhere, but they are usually imported. The Teutonic races seem to be especially free from the taint. Leper asylums are maintained in Norway and at two or three places in the Baltic, San Remo, Cyprus, Constantinople, Alicante, and Lisbon. Except in Spain, where some increase has taken place, the disease is dying out. The number of lepers in Norway was 3000 in 1856, but has now dwindled to a few hundred. They are no longer numerous in any part of Europe. On the other hand, leprosy prevails extensively throughout Asia, from the Mediterranean to Japan, and from Arabia to Siberia. It is also found in nearly all parts of Africa, particularly on the east and west coasts near the equator. In South Africa it has greatly increased, and attacks the Dutch as well as natives. Leper asylums have been established at Robben Island near Cape Town, and in Tembuland. In Australia, where it was introduced by Chinese, it has also spread to Europeans. In New Zealand the Maoris are affected; but the amount of leprosy is not large in either country. A much more remarkable case is that of the Sandwich Islands, where the disease is believed to have been imported by Chinese. It was unknown before 1848, but in 1866 the number of lepers had risen to 230 and in 1882 to 4000 (Liveing). All attempts to stop it by segregating lepers in the settlement of Molokai appear to have been fruitless. In the West Indies and on the American continent, again, leprosy

has a wide distribution. It is found in nearly all parts of South and Central America, and in certain parts of North America—namely, Louisiana, California (among Chinese), Minnesota, Wisconsin and Dakota (Norwegians), New Brunswick (French Canadians).

It is difficult to find any explanation of the geographical distribution and behaviour of leprosy. It seems to affect islands and the sea-coast more than the interior, and to some extent this gives colour to the old belief that it is caused or fostered by a fish diet, which has been revived by Mr Hutchinson, but is not generally accepted. Leprosy is found in interiors where fish is not an article of diet. Climate, again, has obviously little, if any, influence. The theory of heredity is equally at fault, whether it be applied to account for the spread of the disease by transmission or for its disappearance by the elimination of susceptible persons. The latter is the manner in which heredity might be expected to act, if at all, for lepers are remarkably sterile. But we see it persisting among the Eastern races, who have been continuously exposed to its selective influence from the earliest times, while it has disappeared among the Europeans, who were affected very much later. The opposite theory of hereditary transmission from parents to offspring is also at variance with many observed facts. Leprosy is very rarely congenital, and no cases have occurred among the descendants to the third generation of 160 Norwegian lepers settled in the United States. Again, if hereditary transmission were an effective influence, the disease could hardly have died down so rapidly as it did in Europe in the 15th century. Then we have the theory of contagion. There is no doubt that human beings are inoculable with leprosy, and that the disease may be communicated by close contact. Cases have been recorded which prove it conclusively; for instance, that of a man who had never been out of the British islands, but developed leprosy after sharing for a time the bed and clothes of his brother, who had contracted the disease in the West Indies. Other single cases of communication from person to person have been established; and on a larger scale, the spread of the disease when introduced into countries by immigrants has been already noted. But a great number of observations go to show that the contagiousness of leprosy is very slight and quite personal. It seems, at any rate, insufficient to account for the rapid increase which has taken place in the Sandwich Islands in spite of the segregation. This case and some of the other facts noted, such as the extensive dissemination of the disease in Europe during the Middle Ages, and its subsequent rapid decline, suggest the existence of some unknown epidemic factor. Poverty and insanitation are said to go with the prevalence of leprosy, but they go with every malady, and there is nothing to show that they have any special influence. Vaccination has been blamed for spreading it, and a few cases of communication by arm-to-arm inoculation are recorded. The influence of this factor, however, can only be trifling. Vaccination is a new thing, leprosy a very old one; where there is most vaccination there is no leprosy, and where there is most leprosy there is little or no vaccination. In India 78 per cent. of the lepers are unvaccinated, and in Canton since vaccination was introduced leprosy has declined (Cantlie). On the whole we must conclude that there is still much to be learnt about the conditions which govern the prevalence of leprosy.

With regard to prevention, the isolation of patients is obviously desirable, especially in the later stages, when open sores may disseminate the bacilli; but complete segregation, which has been urged, is regarded as impracticable by those who have had most experience in

leprosy districts. Scrupulous cleanliness should be exercised by persons attending on lepers or brought into close contact with them. In treatment the most essential thing is general care of the health, with good food and clothing. The tendency of modern therapeutics to attach increasing importance to nutrition in various morbid states, and notably in diseases of degeneration, such as tuberculosis and affections of the nervous system, is borne out by experience in leprosy, which has affinities to both; and this suggests the application to it of modern methods for improving local as well as general nutrition by physical means. A large number of internal remedies have been tried with varying results; those most recommended are chaulmoogra oil, arsenic, salicylate of soda, salol, and chlorate of potash. In the later stages of the disease there is a wide field for surgery, which is able to give much relief to sufferers.

Lepsius, Carl Richard (1810–1884), Egyptologist, was born at Naumburg-am-Saale, 23rd December 1810, and in 1823 was sent to the "Schulpforte" school near Naumburg, where he came under the influence of Professor Lange. In 1829 he entered the University of Leipzig, and one year later that of Göttingen, where, under the influence of Otfried Müller, he finally decided to devote himself to the archaeological side of philology. From Göttingen he went to Berlin in 1832, where he graduated as doctor with the thesis *De tabulis Eugubinis*. In the same year he proceeded to study in Paris, and was commissioned by the duc de Luynes to collect material from the Greek and Latin writers for his work on the weapons of the ancients. In 1834 he took the Volney prize with his *Paläographie als Mittel der Sprachforschung*. Befriended by Bunsen and Humboldt, Lepsius threw himself with great ardour into Egyptological studies, and in 1835 presented to the Berlin Academy two dissertations on the Egyptian alphabet and numerals. Having greatly advanced his knowledge of hieroglyphics, he proceeded to Turin at the end of 1835. Here his meditative studies laid the foundation for his future splendid edition of the *Book of the Dead* (1842). It was by his advice that the Drovetti collection at Livorno was afterwards acquired for the Berlin Museum. In May 1836 he went to Rome, where Bunsen, who was engaged on his great work *Aegypten's Stelle in der Weltgeschichte*, had his collaboration. In 1837 Lepsius addressed a remarkable letter to Rosellini on the hieroglyphic alphabet, and in the following year left Rome to study the Egyptian collections at Leyden and to visit England. He then returned to Germany, where Humboldt and Bunsen united their influence to make his projected visit to Egypt a scientific expedition with royal support. A prolonged stay at Memphis gave Lepsius the opportunity of deep researches into early Egyptian history and chronology. At the end of 1845 he returned home, and the results of the expedition, consisting of some 1500 specimens and casts, far surpassed expectations. On 5th July 1846 he married Elisabeth Klein, and his appointment to a professorship in the Berlin University in the following August afforded him the leisure necessary for the completion of his work. In 1856 the twelve volumes of his vast *Denkmäler aus Aegypten und Aethiopien* were finished; they comprise the entire archaeological, palaeographical, and historical results of the Egyptian expedition, and their wealth of lithographed inscriptions renders them an indispensable corpus for the study of Egyptology. In the same year Lepsius detected the forgery of the lost work of Stephanus of Byzantium, *Αἰγυπτίων βασιλέων ἀναγραφῶν βιβλίοι τρεῖς*, which Simonides attempted to palm off upon the Berlin Academy for 2500 thalers. The next subject that engaged his

attention was metrology, but here the results of his investigations were warmly contested by Oppert and the younger school of Assyriologists. His editorship of the *Zeitung für Aegyptische Sprache und Alterthumskunde* soon raised that journal to the rank of an international organ. In 1866 Lepsius again went to Egypt, and brought back with him the famous Decree of Taxis or Table of Canopus, which was found among the ruins of Sān, one of the most important finds since the Rosetta Stone. In 1869 Lepsius visited Egypt for the third and last time, and in 1873 he succeeded Pertz as keeper of the Royal Library, Berlin, which, like the Berlin Museum, owes much to his care. About ten years later he was appointed Geheimer Oberregierungsrath. He died at Berlin, 10th July 1884. Lepsius was a fine specimen of the best type of German scholar, modest, patient, simple, and enthusiastic. (G. F. B.)

Lercara, a town of the province of Palermo, Sicily, Italy, 49 miles south by west of Termini by rail, 2166 feet above sea-level. It has important sulphur mines and manufactures of macaroni and lime. Population (1881), 13,324; (1897), 14,000.

Lerici, a small seaport town and summer resort of the province of Genoa, Liguria, Italy, on the east side of the entrance to the Gulf of Spezia, 4 miles south-east of Spezia. It has an old castle and three churches, and is a place of some industry, chiefly lead and silver refining (at Pertusola, but in the commune), shipbuilding, foundries, machine shops, macaroni factories, and olive-oil presses. Within its commune is San Terenzo, where Shelley lived. Population (1881), 5575; (1897), 6000.

Lérida, a province of Spain, on the French frontier. It has an area of 4772 square miles, and is divided into eight administrative districts and 325 parishes. The population decreased somewhat between 1887 and 1897, namely, from 285,417 in the former year to 284,693 in 1897. The birth-rate is 3·07 per cent., the death-rate 2·74 per cent., and the proportion of illegitimate births only 0·90 per cent., the lowest provincial average in Spain. The railway from Saragossa to Barcelona runs across the province for 65 miles. The Spanish Government has entered into an agreement with France to carry another line, putting Lérida into communication with Tarragona and the Mediterranean coasts, to the mouth of an international tunnel through the Pyrenees. Industries are in a more backward condition than in any other province of Catalonia, though there is abundant water power, and excellent wool is obtained. There are, however, 20 cotton and linen factories, 60 flour mills, 70 alcohol or liqueur manufactories, 18 paper mills, 16 soap works, 70 sawmills, and a few oil and leather factories. The local trade is active in wine, oil, wool, timber, cattle, mules, horses, and sheep. In 1898 the live stock included 2580 horses, 17,263 mules, 23,049 asses, 21,865 cattle, 158,915 sheep, 15,621 goats, and 16,815 pigs. Despite the backward state of agriculture, 129,735 acres were in 1898 devoted to the cultivation of wheat, 77,847 acres to barley, rye, oats, maize; 10,900 acres to chick-peas and beans; 103,000 acres to vines; and 135,627 acres to olive plantations. Mining is as yet unimportant, only four mines being worked, but there are 68 registered (chiefly lignite), though unproductive. LÉRIDA, the capital of the province, had a population of 21,337 in 1897. The aspect of the place has changed considerably since 1880, an extensive new suburb having sprung up on the left bank of the Segré, with broad, regular streets, squares, and promenades, forming a marked contrast to the old town on the right bank. There are good

schools, hospitals, public libraries, and some trade in the products of local industries and agriculture.

Leroy-Beaulieu, Henry Jean Baptiste Anatole (1842—), French publicist, was born at Lisieux in 1842. In 1866 he published *Une troupe de comédiens*, and afterwards *Essai sur la restauration de nos monuments historiques devant l'art et devant le budget*, which deals particularly with the restoration of the cathedral of Evreux. He visited Russia in order to collect documents on the political and economic organization of the Slav nations, and on his return published in the *Revue des Deux Mondes* (1882–89) a series of articles with the title “L'Empire des Tsars et les Russes.” The work entitled *Un Empereur, un Roi, un Pape, une Restauration*, published in 1879, was an analysis and criticism of the politics of the Second Empire. *Un homme d'état russe* (1884) gave the history of the emancipation of the serfs by Alexander II. Other works are *Les Catholiques Libéraux, l'Église et le Libéralisme* (1890), *La Papauté, le Socialisme et la Démocratie* (1892). In 1881 M. Leroy-Beaulieu was elected professor of contemporary history and Eastern affairs at the École Libre des Sciences Politiques, and in 1887 he became a member of the Académie de Sciences Morales et Politiques. From 1883 to 1891 he represented Auberive in the Conseil-Général of the Haute-Marne.

Leroy-Beaulieu, Pierre Paul (1843—), French economist, brother of the preceding, was born at Saumur on 9th December 1843, and educated in Paris at the Lycée Bonaparte and the École de Droit. He afterwards studied at Bonn and Berlin, and on his return to Paris began to write for *Le Temps*, *Revue Nationale*, and *Revue Contemporaine*. In 1867 he won a prize offered by the Academy of Moral Science with an essay entitled “L'influence de l'état moral et intellectuel des populations ouvrières sur le taux des salaires.” In 1870 he gained three prizes for essays on “La colonisation chez les peuples modernes,” “L'administration en France et en Angleterre,” and “L'impôt foncier et ses conséquences économiques.” In 1872 Leroy-Beaulieu became professor of finance at the newly-founded École Libre des Sciences Politiques, and in 1880 he succeeded his father-in-law, Michel Chevalier, in the chair of political economy in the Collège de France. Professor Leroy-Beaulieu is the author of several works which have made their mark beyond the borders of his own country. Among these may be mentioned his *Recherches économiques, historiques et statistiques sur les guerres contemporaines*, a series of studies published between 1863 and 1869, in which he calculated the loss of men and capital caused by the great European conflicts. Other works by him are—*La question monnaie au dix-neuvième siècle* (1861), *Le travail des femmes au dix-neuvième siècle* (1873), *Traité de la science des finances* (1877), *Essai sur la repartition des richesses* (1882), *L'Algérie et la Tunisie* (1888), *Précis d'économie politique* (1888), and *L'état moderne et ses fonctions* (1889). He also founded the *Économiste Français*, on the model of the English *Economist*. Leroy-Beaulieu may be regarded as the leading representative in France of orthodox political economy, and the most pronounced opponent of protectionist and collectivist doctrines. He has stood several times for election on the Municipal Council of Paris and the Chamber of Deputies, but always without success.

Lerwick, a burgh of barony, police burgh, and county town of Shetland, Scotland, on Bressay Sound, on the eastern shore of Mainland (or Pomona), the principal island of the group. It consists of one narrow street a mile long, and is 115 miles north-east of Kirkwall and 340 miles from

Leith by steamer. There are county buildings and a new town hall, which has a Queen Victoria Jubilee commemoration clock and chime of bells. Lerwick is an important fishing centre. (For statistics, see SHETLAND.) The other industries are connected with the retail trade among the islands and the knitting of woollen goods. There is steamer communication with Aberdeen, Leith, and Kirkwall. A new harbour has been built, giving 12 feet of water beside the pier at low tide. At the end of 1900, 38 vessels of 2111 tons were registered at the port. In 1888, 525 vessels of 85,826 tons entered; in 1900, 851 vessels of 135,180 tons. Exports were valued at £98,432 in 1888 and £449,746 in 1900. There is a secondary school with an elementary department. Population (1881), 4045; (1901), 4061.

Lesbos, or MITYLENE (Turkish, *Midilli*), a Turkish island in the Ægean Sea, separated by a strait from 7 to 10 miles wide from the coast of Asia Minor, north of the Gulf of Smyrna, and a sanjak of the Archipelago vilâyet. This beautiful island, surrounded by a sea teeming with fish, is rugged and mountainous, its highest point, Mount Olympus (*Hagios Elias*), rising to 3080 feet. The coast-line is broken on the south-east by Porto Iero or Olivieri, and on the south-west by the deeper inlet of Porto Kallone. The crops are almost exclusively olives, but figs, grapes, lemons, and oranges are also grown. Antimony, good marble, and a little coal are found in the island. The climate is healthy and temperate; the annual average rainfall is 26.6 inches, and the death-rate only 11 per 1000 inhabitants. The principal exports are olive oil, soap, and valonea. The total trade averages about £700,000 annually, the imports exceeding the exports by about £10,000. The population is about 130,000, of whom 13,000 are Turks and Moslems, and 117,000 Greeks.

Lesina (Slavonic, *Hvar*), an Austrian island in the Adriatic, off the Dalmatian coast, between the islands of Brazza in the north and Curzola in the south, and divided from the peninsula of Sabbioncello by the Narenta channel. It is about 42 miles long, with a maximum breadth of less than 4 miles. It has a steep, rocky coast with a chain of thinly wooded limestone hills, of which the highest point, Monte San Nicolo, is about 2070 feet above the level of the sea. The climate is mild, and not only the grape and olive, but dates, figs, and the carob or locust-bean flourish. The cultivation of these fruits, boat-building, fishing, and the preparation of rosemary essence and liqueurs are the principal resources of the inhabitants. The chief town and harbour of the same name is the seat of the government district (which includes Cittavecchia, Lissa, and some small neighbouring islands, with a total population of 27,928) and a bishop. It is a station of the Austrian Lloyd, and contains an arsenal, an observatory, and some interesting old buildings of the 16th century. Population, 3828.

Leskovatz, a town in Servia, between Nish and Vrania, on the railway line from Nish to Salonica, 3½ miles to the east of the river Morava. It is the centre of the Servian hemp industry, the extensive plain in which the town lies growing the best flax and hemp in all the Balkan peninsula. The plain is not only the most fertile portion of Servia, but also the best cultivated. Besides flax and hemp, excellent tobacco is grown. Five valleys converge on the plain from different directions, and the inhabitants of the villages in these valleys are all occupied in growing flax and hemp, which they send to Leskovatz to be stored or manufactured into ropes. After Belgrade and Nish, Leskovatz is the most prosperous town in Servia. Population (1895), 12,989.

Leslie, Fred [FREDERICK HOBSON] (1855–1892), English actor, was born at Woolwich, 1st April 1855. He began a connexion with the stage as an amateur in early life, and first appeared at a London theatre in 1878. He had a good voice, and gradually came to the front in light opera, and in 1882 made a great hit as Rip van Winkle in Planquette's piece of that name at the Comedy Theatre. In 1885 he appeared at the Gaiety as Jonathan Wild in the burlesque *Little Jack Sheppard*. His extraordinary success in this part determined his subsequent career, and thereafter he and Miss Nelly Farren were the pillars of Gaiety burlesque. Fred Leslie's Don Cæsar de Bazan in *Ruy Blas, or the Blasé Roué*, was perhaps the most popular of his later parts. In all of them it was his own versatility and entertaining personality which formed the attraction; whether he sang, danced, whistled, or "gagged," his performance was an unending flow of high spirits and ludicrous charm. Under the pseudonym of "A. C. Torr" he was acknowledged on the programmes as part-author of these burlesques, and their success at the Gaiety Theatre owed everything to him and Miss Farren, with whom he played in perfect association. Leslie acted on occasion in more serious comedy, for which he had undoubted capacity; but his fame rests on his connexion with the Gaiety burlesque of the 'eighties. In spite of such clever imitators of his methods as E. J. Lonnen and others, Fred Leslie's death on 7th December 1892 really involved the transition of "Gaiety burlesque" into the "musical comedy" of the 'nineties—a form of entertainment depending much less on genuine originality.

Lesseps, Ferdinand de (1805–1894).—Few lives have had greater vicissitudes than, or experienced such a manifold succession of triumphs and misfortunes as, that of Ferdinand de Lesseps. His French compatriots treated him by turns as a demi-god and a criminal, although he had never been other than a great man, nor had ever merited the trials that overwhelmed him during his closing years. History will give him a place of honour, for all his acts were dominated by an extraordinary zeal for the welfare of his fellow-men. The origin of his family has been traced back as far as the end of the 14th century. His ancestors, it is believed, came from Scotland, and settled at Bayonne when that region was occupied by the English. One of his great-grandfathers was town clerk and at the same time secretary to Queen Anne of Neuberg, widow of Charles II. of Spain, exiled to Bayonne after the accession of Philip V. From the middle of the 18th century the ancestors of Ferdinand de Lesseps followed the diplomatic career, and he himself occupied with real distinction several posts in the same calling from 1825 to 1849. His uncle was ennobled by King Louis XVI., and his father was made a count by Napoleon I.

Ferdinand de Lesseps was born at Versailles on the 19th of November 1805. His father, Mathieu de Lesseps, was a consul; his mother, Catherine de Grivègnée, was Spanish, and aunt of the countess of Montijo, mother of the Empress Eugénie. His first years were spent in Italy, where his father was occupied with his consular duties. He was educated at the College of Henry IV. in Paris. From the age of 18 years to 20 he was employed in the commissary department of the army. From 1825 to 1827 he acted as assistant vice-consul at Lisbon, where his uncle, Barthélemy de Lesseps, was the French chargé d'affaires. This uncle was an old companion of La Pérouse and a survivor of the expedition in which that navigator perished. In 1828 Ferdinand was sent as an assistant vice-consul to Tunis, where his father was consul-general. He courageously aided the escape of Youssouff, pursued by the soldiers of the Bey, of whom he was one of the

officers, for violation of the seraglio law. Youssouff acknowledged this protection given by a Frenchman by distinguishing himself in the ranks of the French army at the time of the conquest of Algeria. Ferdinand de Lesseps was also entrusted by his father with missions to Marshal Count Clausel, general-in-chief of the army of occupation in Algeria. The marshal wrote to Mathieu de Lesseps on the 18th of December 1830: "I have had the pleasure of meeting your son, who gives promise of sustaining with great credit the name he bears." In 1832 Ferdinand de Lesseps was appointed vice-consul at Alexandria. To the placing in quarantine of the vessel which took him to Egypt is due the origin of the great conception of a canal across the isthmus of Suez. In order to help him to while away the time at the lazaretto, M. Mimaut, consul-general of France at Alexandria, sent him several books, among which was the memoir written upon the Suez Canal, according to Bonaparte's instructions, by the civil engineer Lapère, one of the scientific members of the French expedition. This work struck de Lesseps's imagination, and gave him the idea of piercing the African isthmus. This idea, moreover, was conceived in circumstances that were to prepare the way for its realization. Mehemet Ali, who was the viceroy of Egypt, owed his position, to a certain extent, to the recommendations made in his behalf to the French Government by Mathieu de Lesseps, who was consul-general in Egypt when Mehemet Ali was a simple colonel. The Viceroy therefore welcomed Ferdinand affectionately, while Said Pacha, Mehemet's son, began those friendly relations that he did not forget later, when he gave him the concession for making the Suez Canal. In 1833 Ferdinand de Lesseps was sent as consul to Cairo, and soon afterwards given the management of the consulate-general at Alexandria, a post that he held until 1837. While he was there a terrible epidemic of the plague broke out and lasted for two years, carrying off more than a third of the inhabitants of Cairo and Alexandria. During this time he went from one city to the other, according as the danger was more pressing, and constantly displayed an admirable zeal and an imperturbable energy. Towards the close of the year 1837 he returned to France, and on the 21st of December married Mlle. Agathe Delamalle, daughter of the Government prosecuting attorney at the court of Angers. By this marriage M. de Lesseps became the father of five sons. In 1839 he was appointed consul at Rotterdam, and in the following year transferred to Malaga, the place of origin of his mother's family. In 1842 he was sent to Barcelona, and soon afterwards promoted to the grade of consul-general. In the course of a bloody insurrection in Catalonia, which ended in the bombardment of Barcelona, Ferdinand de Lesseps showed the most persistent bravery, rescuing from death, without distinction, the men belonging to the rival factions, and protecting and sending away not only the Frenchmen who were in danger, but foreigners of all nationalities.

From 1848 to 1849 he was minister of France at Madrid. In the latter year the Government of the French Republic confided to him a mission to Rome at the moment when it was a question whether the expelled Pope would return to the Vatican with or without bloodshed. Following his interpretation of the instructions he had received, de Lesseps began negotiations with the existing Government at Rome, according to which Pius IX. should peacefully re-enter the Vatican and the independence of the Romans be assured at the same time. But while he was negotiating, the elections in France had caused a change in the foreign policy of the Government. His course was disapproved; he was recalled and brought before the Council of State, which blamed his conduct without giving him a chance to justify himself. Rome, attacked by the French army, was taken by assault after a month's sanguinary siege. M. de Lesseps then retired from the diplomatic service, and never afterwards occupied any

public office. In 1853 he lost his wife and daughter at a few days' interval. Perhaps his energy would not have been sufficient to sustain him against these repeated blows of destiny if, in 1854, the accession to the vicerealty of Egypt of his old friend, Said Pacha, had not given a new impulse to the ideas that had haunted him for the last twenty-two years concerning the Suez Canal. Said Pacha invited M. de Lesseps to pay him a visit, and on the 7th of November 1854 he landed at Alexandria; on the 30th of the same month Said Pacha signed the concession authorizing M. de Lesseps to pierce the isthmus of Suez.

A first scheme, indicated by him, was immediately drawn out by two French engineers who were in the Egyptian service, MM. Linant Bey and

Mougel Bey. This project, differing from others that had been previously presented or that were in opposition to it, provided for a direct communication between the Mediterranean and the Red Sea. After being slightly modified, the plan was adopted in 1856 by an international commission of civil engineers to which it had been submitted. Encouraged by this approval, de Lesseps no longer allowed anything to stop him. He listened to no adverse criticism and receded before no obstacle. Neither the opposition of Lord Palmerston, who considered the projected disturbance as too radical not to endanger the commercial position of Great Britain, nor the opinions entertained, in France as well as in England, that the sea in front of Port Said was full of mud which would obstruct the entrance to the canal, that the sands from the desert would fill the trenches, that the two seas were not of the same level—no adverse argument, in a word, could dishearten Ferdinand de Lesseps. His faith made him believe that his adversaries were in the wrong; but how great must have been this faith, which permitted him to undertake the work at a time when mechanical appliances for the execution of such an undertaking did not exist, and when for the utilization of the proposed canal there was as yet no steam mercantile marine!

FERDINAND DE LESSEPS.

(From a photograph by Elliott and Fry, London.)

Impelled by his convictions and talent, supported by the Emperor Napoleon III. and the Empress Eugénie, he succeeded in rousing the patriotism of the French and obtaining by their subscriptions more than half of the capital of two hundred millions of francs which he needed in order to form a company. The Egyptian Government subscribed for eighty millions' worth of shares. The company was organized at the end of 1858. In 1859 the first blow of the pickaxe was given at Port Said, and on the 17th of November 1869 the canal was officially opened by the Khedive, Ismail Pacha. The machinery for digging it had been invented. Great Britain gave to steam navigation an impulse that transformed into a colossal success the work that had been so much discussed, and the Port Said mud, the sands of the desert, and the difference in the level of the two seas became legends of the past. Great Britain showed her powerful vitality in preserving her supremacy upon the sea, although at first sight the new water-way would have seemed to favour, to her detriment, the peoples whose shores are washed by the Mediterranean. As soon as the Suez Canal was finished, the British nation, with its characteristic energy and inexhaustible resources, derived from this enterprise advantages that no other nation on the globe would have succeeded in securing, and this new route, so ardently opposed, gave to British commerce an impetus unequalled in the past and probably not to be rivalled in the future. The opening of the Canal constitutes for the man who conceived and realized it an imperishable title to glory, and this was not forgotten when Ferdinand de Lesseps afterwards suffered so calamitously from the scheme for constructing a canal across the isthmus of Panama. Moreover, while in the interests of his canal he resisted the opposition of British diplomacy, he acted loyally towards Great Britain after Lord Beaconsfield had acquired the Suez shares belonging to the Khedive, by frankly admitting to the board of directors of the company three representatives of the British Government. The consolidation of interests which resulted, and which has been developed by the addition in 1884 of seven other British directors, chosen from among shipping merchants and business men, has augmented, for the benefit of all concerned, the commercial character of the enterprise.

Ferdinand de Lesseps steadily endeavoured to keep out of politics. If in 1869 he appeared to deviate from this principle by being a candidate at Marseilles for the Corps Législatif, it was because he yielded to the entreaties of the Imperial Government in order to strengthen its goodwill for the Suez Canal. Once this goodwill had been shown, he bore no malice towards those who rendered him his liberty by preferring Gambetta. He afterwards declined the other candidatures that were offered him: for the Senate in 1876, and for the Chamber in 1877. In 1873 he became interested in a project for uniting Europe and Asia by a railway to Bombay, with a branch to Peking. He subsequently encouraged Major Roudaire, who wished to transform the Sahara desert into an inland sea. The king of the Belgians having formed an International African Society, de Lesseps accepted the presidency of the French committee, facilitated M. de Brazza's explorations, and acquired stations that he subsequently abandoned to the French Government. These stations were the starting-point of French Congo. This function of acting as a patron of conceptions for bringing peoples together, by diminishing distances, improving their position, and rendering more easily attainable all articles of food, was a sufficiently noble employment to have satisfied his ambition. The extraordinary popularity that he had acquired was, to his mind, a force that should be employed for the world's progress. Might he not, therefore, have been able to

accomplish his mission without exposing himself to the misfortunes that befell him? *Dis aliter visum.* In 1879 a congress assembled in the rooms of the Geographical Society at Paris, under the presidency of Admiral de la Roncière le Noury, and voted in favour of the making of the Panama Canal. Public opinion, it may be declared, designated Ferdinand de Lesseps as the head of the enterprise. It was upon that occasion that Gambetta bestowed upon him the title of *Le Grand Français*. He was not a man to shirk responsibility, and notwithstanding that he had reached the age of 74, he undertook to carry out the Panama Canal project. The history of this enterprise is too recent, too complicated, is bound up with too many disasters and has roused too much anger, to be fully treated here. Politics, which de Lesseps had always avoided, was his greatest enemy in this matter. The winding-up of the Panama Company having been declared in the month of December 1888, the adversaries of the French Republic, seeking for a scandal that would imperil the Government, hoped to bring about the prosecution of the directors of the Panama Company. Their attacks were so vigorously made that the Government was obliged, in self-defence, to have judicial proceedings taken against Ferdinand de Lesseps, his son Charles, and his co-workers Fontane and Cottu. Charles de Lesseps, a victim offered to the fury of the politicians, tried to divert the storm upon his head and prevent it from reaching his father. He managed to draw down upon himself alone the burden of the condemnations pronounced. One of the consequences of the persecutions of which he was the object was to oblige him to spend three years, from 1896 to 1899, in England, where his participation in the management of the Suez Canal had won for him some strong friendships, and where he was able to see the great respect in which the memory and name of his father were held by Englishmen.

As for the work executed at Panama, Sir William Russell has given an interesting appreciation of its value in the following letter, addressed to Ferdinand de Lesseps:

New York, 9th July 1889.

Since visiting the work of the Panama Canal, and having mourned over it, being here on the way from the Pacific coast of South America, I have always desired to write to you. I was astounded by what I saw. I was angry at the idea that such false reports about the nature and progress of the work should have been spread abroad. Naturally, I am not an engineer, but the progress of the work appeared clearly before my eyes and free from the difficulties that I saw you overcome at the Salt Lakes, for example. I was surprised to find the work so far advanced. The surprise, however, was mingled with sorrow and pity in considering that the vast enterprise was in suspense. So many unproductive millions! Silence and solitude where there should be active life and the utilization of so much capital, industry, and thought! I cannot believe that this waste will last. It would be a dishonour for France and a loss for the whole world if the canal were not cut. For my own part, I am sure that it must be finished. I have heard repeated *ad nauseam* the old story about the lack of traffic, and about catastrophes and natural obstacles. I have replied to those who relate these stories that I had already heard the same objections made with even more force and upon greater authority before you accomplished the opening of the Suez Canal. I was told a great deal about the speculation of the contractors, the prodigalities and thoughtless expenditures, and negligence in the supervision. I could not form an opinion as to the value of these reports, but I was able to see that there was, from one end of the canal to the other, a wealth of machinery of all kinds—elevators, drags, lighters, steamboats—in short, a complete flotilla ready to start at the first sign, except what had been destroyed by bad usage or negligence. I cannot help writing to you to tell you of my sympathy and hopes. I pray that you may live to see finished and accomplished the *opus maximum* of your existence, so fertile in great works.

Ferdinand de Lesseps died at La Chenaie on the 7th of December 1894. He had contracted a second marriage in 1869 with Mlle Autard de Bragard, daughter of a former

magistrate of Mauritius; and eleven out of twelve children of this marriage survived him. M. de Lesseps was a member of the French Academy, of the Academy of Sciences, of numerous scientific societies, Grand Cross of the Legion of Honour and of the Star of India, and had received the freedom of the City of London. According to some accounts, he was unconscious of the disastrous events that took place during the closing months of his life. Others report that, feeling himself powerless to scatter the gathered clouds, and aware of his physical feebleness, he had had the moral courage to pass in the eyes of his family, which he did not wish to afflict, as the dupe of the efforts they employed to conceal the truth from him. This last version would not be surprising if we relied upon the following portrait, sketched by a person who knew him intimately:—"Simple in his tastes, never thinking of himself, constantly preoccupied about others, supremely kind, he did not and would not recognize such a thing as evil. Of a confiding nature, he was inclined to judge others by himself. This naturally affectionate abandonment that every one felt in him had procured him profound attachments and rare devotions. He showed, while making the Suez Canal, what a gift he possessed for levying the pacific armies he conducted. He set duty above everything, had in the highest degree a reverence for honour, and placed his indomitable courage at the service of everything that was beneficial with an abnegation that nothing could tire. His marvellous physical and moral equilibrium gave him an evenness of temper which always rendered his society charming. Whatever his cares, his work, or his troubles, I have never noticed in him aught but generous impulses and a love of humanity carried even to those heroic imprudences of which they alone are capable who devote themselves to the amelioration of humanity." No doubt this eulogy requires some reservations. The striking and universal success which crowned his work on the Suez Canal gave him an absoluteness of thought which brooked no contradiction, a despotic temper before which every one must bow, and against which, when he had once taken a resolution, nothing could prevail, not even the most authoritative opposition or the most legitimate entreaties. He had resolved to construct the Panama Canal without locks, to make it an uninterrupted navigable way. All attempts to dissuade him from this resolution failed before his tenacious will. At his advanced age he went with his youngest child to Panama to see with his own eyes the field of his new enterprise. He there beheld the Culebra and the Chagres; he saw the mountain and the stream, those two greatest obstacles of nature that sought to bar his route. He paid no heed to them, but began the struggle against the Culebra and the Chagres. It was against them that was broken his invincible will, sweeping away in the defeat the work of Panama, his own fortune, his fame, and almost an atom of his honour. But this atom, only grazed by calumny, has already been restored to him by posterity, for he died poor, having been the first to suffer by the disaster to his illusions. Political agitators, in order to sap the power of the Opportunist party, did not hesitate to drag in the mud out of the greatest citizens of France. But when the Panama "scandal" has been forgotten, for centuries to come the traveller in saluting the statue of Ferdinand de Lesseps at the entrance of the Suez Canal will pay homage to one of the most powerful embodiments of the creative genius of the 19th century. (DE B.)

Letters Patent.—It is a rule alike of common law and sound policy that grants of freehold interests, franchises, liberties, &c., by the sovereign to a subject should be made only after due consideration, and in a

form readily accessible to the public. These ends are attained through the agency of that piece of constitutional machinery known as "letters patent." It is here proposed to consider only the characteristics of letters patent generally. The law relating to letters patent for inventions is dealt with under the heading PATENTS.

Letters patent (*litteræ patentēs*) are letters addressed by the sovereign "to all to whom these presents shall come," reciting the grant of some dignity, office, monopoly, franchise, or other privilege to the patentee. They are not sealed up, but are left open (hence the term "patent"), and are recorded in the Patent Rolls in the Record Office, or in the case of very recent grants, in the Chancery Enrolment Office, so that all subjects of the realm may read and be bound by their contents. In this respect they differ from certain other letters of the sovereign directed to particular persons and for particular purposes, which, not being proper for public inspection, are closed up and sealed on the outside, and are thereupon called *writs close* (*litteræ clausæ*), and are recorded in the Close Rolls. Among grants made by letters patent the following may be enumerated: offices in the Herald's College; the dignities of knight bachelor, a peerage, or a baronetcy; the appointments of lord-lieutenant, custos rotulorum of counties, justices of the High Court, king's counsel, Crown livings; the offices of attorney- and solicitor-general, commander-in-chief, master of the horse, keeper of the privy seal, postmaster-general, king's printer; grants of separate courts of quarter sessions, royal charters, royal pardons (which may now be granted under the sign-manual), and patents for inventions. Formerly letters patent were always granted under the Great Seal. But now under the Crown Office Act, 1877, and the Orders in Council made under it, many letters patent are sealed with the wafer great seal. Letters patent for inventions are issued under the seal of the Patent Office. The procedure by which letters patent are obtained is as follows:—A warrant for the issue of letters is drawn up, and is signed by the Lord Chancellor; this is submitted to the law officers of the Crown, who countersign it; finally, the warrant thus signed and countersigned is submitted to His Majesty, who affixes his signature. The warrant is then sent to the Crown Office and is filed, after it has been acted upon by the issue of letters patent under the great or under the wafer seal as the case may be. The letters patent are then delivered into the custody of those in whose favour they are granted.

The construction of letters patent differs from that of other grants in certain particulars; (i.) Letters patent, contrary to the ordinary rule, are construed in a sense favourable to the grantor (*viz.*, the Crown), rather than to the grantee; although this rule is said not to apply so strictly where the grant is made for consideration, or where it purports to be made *ex certâ scientiâ et mero motu*. (ii.) When it appears from the face of the grant that the sovereign has been mistaken or deceived, either in matter of fact or in matter of law, as, *e.g.*, by false suggestion on the part of the patentee, or by misrecital of former grants, or if the grant is contrary to law or uncertain, the letters patent are absolutely void, and may be cancelled (except as regards letters patent for inventions, which are revoked by a special procedure, regulated by § 26 of the Patents Act, 1883) still, it would appear, by the procedure known as *scire facias*, an action brought against the patentee in the name of the Crown with the fiat of the Attorney-General.

A word should be added on patents of precedence. A patent of precedence is a grant to an individual by letters patent of a higher social or professional position than the precedence to which his ordinary rank entitles him. The principal instance in modern times of patents of grants

of this description has been the grant of precedence to members of the bar. In the days when acceptance of the rank of king's counsel not only precluded a barrister from appearing against the Crown, but, if he was a member of Parliament, vacated his seat, a patent of precedence was resorted to as a means of conferring similar marks of honour on distinguished counsel without any such disability attached to it. The patents obtained by Mansfield, Erskine, Scott, and Brougham were granted on this ground. After the order of the Coif lost its exclusive right of audience in the Court of Common Pleas, it became customary to grant patents of precedence to a number of the serjeants-at-law, giving them rank immediately after counsel of the Crown already created and before those of subsequent creation. Mr Justice Phillimore was, on his appointment as a judge of the Queen's Bench Division (1897), the only holder of a patent of precedence at the bar, except Serjeant Simon, who died in that year, and who was the last of the serjeants who held such a patent.

Under the Revised Statutes of Ontario, 1897 (c. 173, § 9), the Lieutenant-Governor is empowered to confer on any member of the bar a grant of precedence in the courts by letters patent under the great seal of Canada; and it was recently held by the Privy Council that this statutory provision was *intra vires* the provincial legislature.

As to letters patent generally, see BACON'S *Abridgment* ("Pre-rogative," F); CHITTY'S *Prerogative*; HINDMARSH ON *Patents*. As to patents of precedence, see PULLING'S *Order of the Coif*.

(A. W. R.)

Leven, a police burgh of Fifeshire, Scotland, on the Firth of Forth, at the mouth of the river Leven, 6 miles east of Thornton Junction by rail. A town hall was erected in 1892. A costly attempt to construct a wet dock has proved a failure, owing to the accumulation of sand. Flax-spinning and linen-weaving are carried on, and there are breweries, foundries, brick-works, and rope-works. In the immediate neighbourhood are large collieries. There is a fine golf course, and the town is much frequented by summer visitors. Population (1881), 3568; (1891), 4577; (1901), 5577.

Leven, Loch.—1. A lake in Kinross county, Scotland, $3\frac{1}{2}$ miles in extreme length and 2 miles in extreme breadth. The depth varies from 10 to 90 feet, the mean height above sea is 353 feet, and the area 3406 acres. It drains Kinross-shire by four streams, and the river Leven drains its surplus. There are seven islands, of which the largest, St Serf's, was the site of a Culdee settlement, and contains the ruins of a priory. On the Castle island, connected with the land by a submerged causeway, are the ruins of the castle in which Queen Mary of Scotland was imprisoned in 1567. The loch is noted for its trout. The fishings are controlled by an Angling Association, and the average annual catch for the years 1895–99 was 16,746 trout of 11,421 pounds weight. 2. **LOCH LEVEN** is also the name of an arm of the sea opening east off Loch Linnhe, at the north of Argyllshire and the south of Inverness-shire. North and South Ballachulish, on opposite shores of the loch, are well-known villages. The latter is famed for its slate quarries, and is also the point of call for steamers conveying tourists to or from Glencoe.

Levi, Hermann (1839–1900), German orchestral conductor, was born at Giessen on 7th November 1839, and was the son of a rabbi. He was educated at Giessen and Mannheim, and came under Vincenz Lachner's notice. From 1855 to 1858 Levi studied at the Leipzig Conservatorium, and after a series of travels which took him to Paris, he obtained his first post as music director at Saarbrücken, which post he exchanged for that at Mann-

heim in 1861. From 1862 to 1864 he was chief conductor of the German Opera in Rotterdam; then till 1872 at Carlsruhe, when he went to Munich, a post he held until 1896, when ill-health compelled him to resign. Levi's name is indissolubly connected with the propagation of the knowledge of Wagner's music. He conducted the first performance of *Parsifal* at Bayreuth in 1882, and was connected with the musical life of that place during the remainder of his career. He created a great impression as a concert conductor on the occasion of his visit to London in 1895.

Levi, Leone (1821–1888), English jurist and statistician, was born of Jewish parents on 6th June 1821, at Ancona, Italy. After receiving an early training in a business house in his native town, he came to Liverpool in 1844 in pursuit of commerce, became naturalized, and changing his faith, joined the Presbyterian Church. Perceiving the necessity, in view of the unsystematic condition of the English law on the subject, for the establishment of chambers and tribunals of commerce in England, he warmly advocated their institution in numerous pamphlets; and as a result of his strenuous labours the Liverpool Chamber of Commerce, of which Levi was made secretary, was founded in 1849. In 1850 Levi published his *Commercial Law of the World*, being an exhaustive and comparative treatise upon the laws and codes of mercantile countries. Appointed in 1852 to the chair of commercial law in King's College, London, he proved himself a highly competent and popular instructor, and his evening classes were a most successful innovation. He was called to the bar at Lincoln's Inn in 1859, and received from the University of Tübingen the degree of Doctor of Political Science. His *magnum opus*—*History of British Commerce and of the Economic Progress of the British Nation, 1763–1870*, is perhaps a rather too partisan account of British economic development, being a eulogy upon the blessings of Free Trade, but its value as a work of reference cannot be gainsaid. Among his other works are: *Work and Pay*; *Wages and Earnings of the Working Classes*; *International Law, with Materials for a Code*. He died on 7th May 1888.

Lévis, the chief town of Lévis county, Quebec, Canada, situated on the south bank of the St Lawrence, opposite Quebec city. It is the landing-place for transatlantic passengers, is on the Intercolonial railway, and is the eastern terminus of the Grand Trunk and Quebec Central railways. It contains a Dominion Government graving dock, 445 feet long, 100 feet wide, with a depth on the sill of 26½ and 20½ feet at high water spring and neap tide respectively. Population (1881), 7597; (1891), 7301; (1901), 7783.

Lewes, a municipal borough (1881), market town and county town, in the Lewes parliamentary division (since 1885) of Sussex, England, on the Ouse, 50 miles south of London by rail. St Michael's and St John's churches have been restored, and the county hall enlarged. Modern erections are the town hall, the corn exchange, and the public library. Area, 1024 acres. Population (1881), 11,199; (1901), 11,249.

Lewis and Harris form together the Long Island of the Outer Hebrides, Scotland, the former being in Ross-shire and the latter in Inverness-shire. Its area is 770 square miles, and it embraces in its civil parish St Kilda and a number of smaller islands. Though rents have been largely reduced by the Crofters' Commission, and considerable sums expended on improvements by Government, the bulk of the crofters still live in miserable huts, and show little enterprise in the development of the fisheries; but the fishermen on the east side have of late

years secured good boats of the newest type fitted with beam trawling gear. (For statistics, see STORNOWAY.) The making of kelp is no longer followed. A harbour has been built at Carloway and a pier at Bracadale; the harbour at Port Ness has been extended, and a road from Stornoway to Carloway was begun, but abandoned half-made. There are some good sheep farms in Harris. There are six parishes. Population of Lewis (1881), 24,876; (1891), 27,045, of whom 24,747 were Gaelic-speaking; (1901), 28,949: of the parish of Harris (1881), 4814; (1891), 5024, of whom 4195 were Gaelic-speaking; (1901), 5275.

Lewiston, a city of Androscoggin county, Maine, U.S.A., on the left bank of the Androscoggin river, at an altitude of 138 feet, on the Maine Central, the Grand Trunk, and the Portland and Rumford Falls railways. It has a fairly regular plan, is divided into seven wards, has a good water-supply obtained from Lake Auburn, and is also well sewered. By virtue of its fine water-power, it has great prominence in manufacturing, especially of cotton goods. In 1900 the total number of manufacturing establishments was 282, with a capital of \$10,984,871. They employed an average number of 7159 wage-earners, and their products were valued at \$8,581,354; of this sum more than one-half (\$4,638,115) represented cotton goods. Bates College, a Baptist institution situated here, had in 1899 a faculty of 24, and was attended by 307 students, more than one-third of whom were women. Population (1890), 21,701; (1900), 23,761, of whom 9316 were foreign-born.

Lexington, a city of Kentucky, U.S.A., capital of Fayette county, at an altitude of 946 feet. It is the meeting-place of five railways, the Chesapeake and Ohio, the Lexington and Eastern, the Louisville and Nashville, the Queen and Crescent Route, and the Southern. It is in the Blue Grass region, the home of Henry Clay, famous for its blooded horses and fine tobacco. In 1900 its manufactures were carried on by 271 establishments, with a capital of \$1,532,378. They employed an average number of 1441 wage-earners, and their products were valued at \$2,925,697. Lexington is the seat of Kentucky University, a Christian institution, founded in 1836. In 1899 this had a faculty of 35 and was attended by 425 students. The State Agricultural and Mechanical College is also situated here; in the same year it had a faculty of 25 and an attendance of 480 students. There are also two collegiate institutions for women, the Hamilton Female College and the Sayre Female Institute. Population (1890), 21,567; (1900), 26,369, of whom 924 were foreign-born and 10,130 were negroes.

Lexington, a town of Middlesex county, Massachusetts, U.S.A., 11 miles north-west of Boston. Its area comprises some 17 square miles, mainly level, but with occasional hills. It contains three villages, Lexington, East Lexington, and North Lexington. The village of Lexington was the scene of the first armed conflict of the Revolution. A British command, sent from Boston to destroy military stores collected at Concord by the colonists, was met, 18th April 1775, at Lexington by a small body of colonial militia. The latter were fired upon, and several were killed and wounded by the British soldiers, who then proceeded to Concord and destroyed the stores. On their return to Boston they were severely handled by the militia, who dogged their steps and picked them off as opportunity offered. Population (1880), 2460; (1890), 3197; (1900), 3831, of whom 959 were foreign-born.

Lexington, a city of Missouri, U.S.A., capital of Lafayette county, on the south bank of the Missouri river,

and the Atchison, Topeka, and Santa Fé, and the Missouri Pacific railways, at an altitude of 813 feet. Its site is the face and summit of the river bluffs, and it has a regular plan. It is the seat of two colleges for women. During the Civil War it was the scene of several minor military operations. Population (1880), 3906; (1890), 4537; (1900), 4190, of whom 283 were foreign-born and 1170 were negroes.

Leyden, or LEIDEN, a city of the Netherlands, in the province of South Holland, 10 miles north-north-east of The Hague. The highways along the dunes and the Rhine here cross each other. Steam tramways have been laid to Katwyk, a watering-place 5 miles to the north-west on the North Sea, to Haarlem, and to The Hague. There is also steamboat communication with Katwyk, Amsterdam, and Gouda. Among modern erections are the anatomical and pathological laboratories of the university, and the museum for geology and mineralogy has been restored; a monument (1884) to Burgomaster Van der Werf, who defended the town during the Spanish siege of 1574, raised in the "Ruine," lately transformed into Van der Werf's Park; and a new post office (1897). A seamen's training school is also of recent foundation. The local transit trade is still important, amounting annually to an average of 490 tons of butter and 590 tons of cheese. The woollen and linen manufactures employ about 1500 workmen. Population (1899), 53,658.

Lhasa.—The sources of information as to Lhasa which existed in 1875 were those derived from the records of Mauning, who visited the city in 1811, and of the Jesuit fathers Huc and Gabet, who were there in 1844-46. In 1874 the Indian pundit Nain Singh paid his second visit, and his account of the city formed a most substantial addition to previous authorities. In 1879 the explorer A. K. (Kishen Singh), on his way to Koko Nor, remained for some time in Lhasa; and since then several European explorers have essayed to reach it, notably Bower in 1891, de Rhins in 1893, and Littledale in 1895. Littledale reached the Goring Tang valley after crossing the Goring La from the north, and was then within fifty miles of the walls of the sacred city. He probably approached closer than de Rhins or Bonvalot, who (with Prince Henri d'Orleans) had also adopted the northern route in 1890. All of them were equally unsuccessful. Neither Chinese passports nor English gold have availed to open the gates of that stronghold of Tibetan exclusiveness, and for half a century no European visitor has been seen in the streets of Lhasa. But where Europeans have failed native Indian explorers have again been successful. Sarat Chandra Das, of the Bengal Educational Department, who was accompanied by a trained explorer, the Lama Ugyen, after crossing the Kanglachen pass on the western borders of Sikkim into Tibet, made his way to Tashilunpo (Shigatsi) in the autumn of 1881, and there remained for some months. During the summer of 1882 he paid a visit to Lhasa, travelling over the route which had been previously followed by Nain Singh, *via* Gyantsi and the Yamdok uplands, to the Chushul ferry across the Tsanpo. Thenceforward the track passes up the Ky-i-chu valley, which is described as the worst part of the journey. A mile and a half of very difficult passage (called Gaglam) follows along the river banks, in no way resembling the Gyantsi section of the route, which is classed by Chandra Das as equal to an ordinary unmetalled Indian road. Over the Gaglam, however, two elephants which had been presented by the Sikkim Raja to the Grand Lama of Tibet had already passed, before Chandra Das bent his steps that way. Much of the Ky-i-chu valley route consists of open plain, with an occasional spread of highly

irrigated country covered with crops and trees, and this again is varied with marsh land and bogs. At the last stage before reaching Lhasa, accommodation is to be found in the Gyakhang, or Chinese Amban's circuit house, which Chandra Das compares to the residence of a Calcutta native gentleman, with its wide verandah bedecked with flowers in pots.

In the month of May the Nehusing—the plain on which Lhasa stands—is gay with grass and flowers, and the scattered groves of poplar and willow afford a refreshing shade from the rays of the early summer sun. Lhasa is then at its best. The western gate (the Pargo Kaling) leads straight under the shadow of the royal Potala, the hill palace of Lhasa, to a small bridge and a second gateway called the Yutog Sampa, whereon is a guard-house, where the Korchaghas, headed by a monk sergeant, keep watch and ward. This is the real entrance to the city, and it is here that the chief difficulty lies with doubtful visitors. On the right of the road, before entering the city gates, on a low pedestal, stands the Doring monolith, eight to ten feet high, bearing an inscription in Chinese and Tibetan. The inscription is still legible, although it is nearly 1000 years old. The suburbs of Lhasa between the Potala palace and the city walls abound in picturesque detail. The broad straight road flanked by ancient trees and the scattered groups of stone-built houses following the fashion of Chinese architecture with "prismoidal" windows, painted cornices, and bluish-gray tiled roofs and turrets, the festoons of inscribed and painted bannerets stretching from turret to turret—all in the clear atmosphere and under the blue sky of the Tibetan early summer, make up a pretty picture enough, apart from the grandeur and glitter of gilded domes and spires where the palace of Potala crowns the hill. Within the city walls the streets are lined with shops of Tibetan, Nepalese, and Chinese merchants, the Chinese especially making a brave show with ornamental ware, although the Nepalese shops, built in three storeys, appear to be the most imposing. In front of all shops are small pyramids of clay, on which dried juniper and cones are burnt, wafting through the air sweet fumes of incense, which apparently are much wanted in remoter parts of the town. Apart from the principal streets, Chandra Das confirms the reports of other visitors that the backways and alleys are indescribably filthy, and the jostling crowd of persistent beggars is probably not to be rivalled for loud aggressiveness anywhere in the Eastern world. Next to the Potala, the chief feature of religious interest is the Kilkhording (also called Cho Kang), the sacred shrine where stands the image of Buddha, said to have been constructed in Magadha during his lifetime. According to Chandra Das, five sacred metals were used to form the alloy of which the figure (which represents Buddha as a prince—not as a priest) is made. The image is life size, well modelled and properly gilt. Four dragon pillars, silver gilt, support the canopy above his sacred head, and the bronze images of Mātreyā and Manjusi stand on guard on either side. Beyond are images innumerable, including the twelve Bodhisattvas and a host of minor saints. The shrine itself is a lofty three-storeyed edifice with a flat roof, exhibiting no trace of Chinese influence in its design. The shrine is situated about the centre of the city.

The palace of the Dalai Lama—the far-famed Potala, which covers with its imposing building a hill to the west of the city (see vol. xiv. p. 500)—proved to be a toilsome and difficult place of approach owing to the innumerable steps and staircases which lead up to it. The ceremony of a divine service in honour of a departed Lama served as an opportunity for the introduction of Chandra Das to the Dalai Lama, the incarnate head of Buddhism in Tibet. He is described as a child of eight, seated on a peat altar

resembling an Oriental throne, borne by lions carved in wood. "A yellow mitre hat covered the Grand Lama's head, the pendent bands of which veiled his ears, a yellow mantle covered his person, and he sat cross-legged with the palms of his hands joined together to bless us." His complexion was bright and fair, with rosy cheeks, his eyes were large and penetrating, and his features remarkably Aryan in spite of the obliquity of his eyes. He was emaciated, and looked fatigued and weary. The Grand Lamas of Tibet traditionally die young. The reception hall is spacious—40 feet by 30 by 15 high—lit by an open skylight. The roof is supported by three rows of wooden pillars, each row containing four pillars. Such in brief is the nature of that central light which illumines the mystic faith of Buddhism, the "holiest of all living holies."

Incidentally we have some new and interesting glimpses of the inner domestic life of the citizens from these latest explorers. The genial warmth of hospitality to strangers and the genuine character of the friendly interest which is taken in those who stand in the position of old friends; the rigid asceticism of the monks, their devotion to study and their simple and frugal habits—all these things, combined with courtly formalities and the stately etiquette which governs the social relations of the higher classes, are in welcome contrast to the weird tales of the ghastly surroundings of the enchanted city—the filthy outcast ragyabas (dagyeba of Kishen Singh), the loathsome corpse-eating swine, the gaunt and mangy dogs, and all the paraphernalia of misery, crime, and filth which seem inseparable from the villages and towns of all delectable mountains north of India.

On the whole the visits of these travellers fully support, if they do not largely increase, the information previously obtained, which has been so well epitomized in Sir H. Yule's article in the earlier volumes of this work. We have a more varied view of the inner life of Tibet, especially as connected with its sanctuaries, and some excellent geographical work executed by the Lama Ugyen (U. G.), though all visits have been of too ephemeral a character to add much to our stock of detailed knowledge. (т. н. н*.)

Libau, a seaport of Russia, on the Baltic Sea, in the government of Courland, 143 miles by rail south-west of Riga. Its population has more than doubled since 1881 (30,000), and attained 64,505 in 1897. New Libau, which is the centre of the industries, possesses several large factories for the making of colours, explosives, transmission belts in paper-pulp, sails and ropes, tobacco, furniture, matches, as well as several iron works, agricultural machinery works, tin-plate works, soap works, saw-mills, and flour mills. The number of ships yearly entering the port remains at about 1900 to 2000, but the exports have reached the annual value of from £3,600,000 to £4,000,000, oats being the chief item of export, while wheat is exported as flour. Flax, hay, spirit, eggs (from 45,000,000 to 56,000,000 a year), and swine meat are also important articles of foreign trade. Shipbuilding, including steamers for open-sea navigation, is also on the increase.

Libel.—Since the publication of the article on libel and slander in vol. xiv. of the *Encyclopædia Britannica* (9th edition) important legislation has been enacted relating to the question of privilege as applied to newspaper reports. It was there shown that certain classes of defamatory statements exist which are called "privileged," i.e., made on occasions when it is a man's duty to speak or write freely. This privilege may be either absolute or qualified. An absolute privilege arises in cases where for the public good the fullest liberty of expression is allowed

by the law, *e.g.*, papers published under the authority of Parliament. A qualified or partial privilege arises on occasions where the law considers it for the public benefit that freedom of publication should be permitted, provided that freedom is only used for the purpose for which it was given, *e.g.*, an answer to an inquiry as to the character of a servant. For the plaintiff to succeed in an action where it is apparent that publication is under this qualified privilege, it is necessary that he should prove express malice or an intention to injure, departing from the general rule in ordinary libels, where the absence of express or actual malice is no defence save in mitigation of damages. To constitute express malice there must be something in the act of the person to show that he published the libel, not with a view of doing that which was right or to punish a person because he deserved to be punished as an act of justice, but dishonourably and with a bye-motive of doing him an injury (*Capital and Counties Bank v. Henty, Grove, J., 5 C.P.D.*).

Both absolute and qualified privilege are given to newspaper reports under certain conditions by the Law of Libel Amendment Act, 1888. The reports must, however, be published in a newspaper as defined in the Newspaper Libel and Registration Act, 1881. Under this Act a newspaper must be published "at intervals not exceeding twenty-six days."

By section 3 of the Act of 1888 fair and accurate reports of judicial proceedings are absolutely privileged provided that the report is published contemporaneously with the proceedings, and no blasphemous or indecent matter is contained therein. By section 4 a limited privilege is given to fair and accurate reports (1) of the proceedings of a *bonâ fide* public meeting lawfully held for a lawful purpose and for the furtherance and discussion of any matter of public concern, even when the admission thereto is restricted; (2) of any meeting, open either to the public or to a reporter, of a vestry, town council, school board, board of guardians, board of local authority, formed or constituted under the provisions of any Act of Parliament, or of any committee appointed by any of these bodies; or of any meeting of any commissioners authorized to act by letters patent, Act of Parliament, warrant under royal sign manual, or other lawful warrant or authority, select committees of either House of Parliament, justices of the peace in quarter sessions assembled for administrative or deliberative purposes; (3) of the publication of any notice or report issued for the information of the public by any Government office or department, officer of state, commissioner of police or chief constable, and published at their request. But the privilege given in section 4 does not authorize the publication of any blasphemous or indecent matter; nor is the protection available as a defence if it be proved that the reports or notices were published maliciously, in the legal sense of the word, or the defendant has been requested to insert in the newspaper in which the report was issued a reasonable letter or statement by way of contradiction or explanation, and has refused or neglected to do so. Moreover, nothing in section 4 is to interfere with any privilege then existing, or to protect the publication of any matter not of public concern, or in cases where publication is not for the public benefit.

An alteration has also been made by the same Act in regard to criminal libel as affecting newspapers. As criminal proceedings for libel rest on the likelihood that a breach of the peace will result from the libel, no criminal prosecution should be commenced where the interests of the public are not affected. By the Law of Libel Amendment Act, 1888, sec. 8, no criminal prosecution for libel is to be commenced against any newspaper proprietor, publisher, or editor unless the order of a judge at chambers has been first obtained. This protection does not cover the actual writer of the alleged libel.

The law of slander has also been changed. In the former article it was shown that, save in a few cases, it is necessary in a slander action to prove special damage; in other words, that substantial or real damage has been caused to the plaintiff by the defendant's statement. The exceptions to this rule were the imputation of a criminal offence, of certain infectious disorders, or of incompetence

in a trade, profession, or employment. Here damage is presumed as in libel. A fourth exception has been added, for by the Slander of Women Act, 1891, it is not necessary to prove special damage to support an action for slander where a woman has been accused of unchastity. (H. S. S.)

Libellatici was the name given to a class of persons who, during the persecution of Decius, A.D. 250, evaded the consequences of their Christian belief by procuring documents which certified that they had satisfied the authorities of their orthodoxy (*i.e.*, as heathens), and which thus exempted them from punishment. As thirty-eight years had elapsed since the last period of persecution, the Churches had become in many ways lax, and the number of those who failed to hold out under the persecution was very great. On the other hand, the procedure of the courts which had cognizance of the matter was by no means strict, and the judges and subordinate officials were often not ill-disposed towards Christians, so that evasion in one way or another was fairly easy. Many of those who could not hold out were able to secure certificates which gave them immunity without actually renouncing the faith, just as "Parliamentary certificates" of conformity used to be given in England without any pretext of fact. It is to the persons who received such certificates that the name belonged. To calculate their number would be impossible, but we know from the writings of Cyprian and other contemporaries that they were a numerous class, and that they were to be found in Italy, in Egypt, and in Africa, and amongst both clergy and laity. Archbishop Benson is probably right in thinking that "there was no systematic and regular procedure in the matter," and that the *libelli*, as the documents in question were called, may have been of very different kinds. They must, however, as a general rule, have consisted of a certificate from the authorities to the effect that the accused person had satisfied them. [The name *libellus* has also been applied to another kind of document—to the letters which were given by confessors, or by those who were about to suffer martyrdom, to persons who had fallen, to be used to secure forgiveness for them from the authorities of the Church. With such *libelli* we are not here concerned.] The subject has acquired a fresh interest from the fact that two of these actual *libelli* have been recovered, in 1893 and 1894 respectively, both from Egypt: one is now in the Brugsch Pasha collection in the Berlin Museum; the other is in the collection of papyri belonging to the Archduke Rainer. The former is on a papyrus leaf about 8 by 3 inches, the latter on mere fragments of papyrus which have been pieced together. The former was first deciphered and described by Dr Fritz Krebs, the latter by Dr K. Wessely: both are given and commented upon by Dr Benson. There is a remarkable similarity between them: in each the form is that N. "was ever constant in sacrificing to the gods"; and that he now, in the presence of the commissioners of the sacrifices (*οἱ ἡρημένοι τῶν θυσίῶν*), has both sacrificed and drunk [or has poured libations], and has tasted of the victims, in witness whereof he begs them to sign this certificate. Then follows the signature, with attestations. The former of the two is dated, and the date must fall in the year 250. It is, of course, impossible to prove that either of the two actually refers to Christians: they may have been given to pagans who had been accused and had cleared themselves, or to former Christians who had apostatized. But no doubt *libelli* in this same form were delivered, in Egypt at least, to Christians who secured immunity without actual apostasy; and the form in Italy and Africa probably did not differ widely from this.

See Archbishop BENSON. *Cyprian*, London, 1897; *Theol. Literaturzeitung*, 20th January and 17th March 1894. (W. E. Co.)

Liberia, a negro republic in West Africa, extending along the coast for about 300 miles between 4° and 7° N. This strip of coast, which is watered by a number of parallel streams, consists for the most part of country of moderate elevation, ending seawards in a fairly high coast-line, the lower courses of the rivers being, however, fringed for a few miles by swamps, while forest seems to occupy a large part of the interior. The soil of the lowlands is generally sandy, except along the course of streams, where deep black fertile soil is found. The surface of the interior plateaux, which fall in a succession of steps towards the coast, consists largely of laterite. For a tropical country the climate is fairly moderate, the heat being lessened by the sea-breeze, which blows regularly during the day except in the Harmattan period. This lasts from December to the end of February, the Harmattan being a land wind marked by extreme dryness, with low temperature at night or in the early morning. The rainy season proper lasts from May to November, but no month passes without rain.

Coasts.—The coast of Liberia is much indented, though the lagoon formation so characteristic of other parts of the Guinea coast is little developed. Many of the capes rise abruptly from the sea. Cape Mount peninsula, on which Robertsport is placed, rises to about 1000 feet at the highest part, and Capes Mesurado and Palmas are also bold headlands. The largest lagoon (Fisherman Lake) is that enclosed by the Cape Mount peninsula. It is generally shallow. The remainder are much smaller, and are generally formed by expansions of the streams at their mouths. A tidal channel runs, however, behind Cape Mesurado parallel to the coasts as far as the mouth of the river Farmington—nearly 40 miles, connecting also with the river St Paul.

Interior.—Our knowledge of the interior of the country, and even of the courses of the main rivers, is still extremely scanty, and depends almost entirely on the journey of the negro Benjamin Anderson in 1868, and those of French explorers along the interior frontier. In the north-western half the head-streams of the rivers Lofa, Dé, or St Paul, and probably also those of the Manoh (which in part forms the frontier with Sierra Leone), rise at a distance of 200 miles from the coast, their upper basins widening fan-wise, while their lower courses approach each other within 35 miles. Their general direction is at right angles to the coast. The same is apparently the case with most of the rivers of the south-east, which have, however, much shorter courses, as the upper basin of the Kavalli (which forms the boundary of Liberia on the south-east) lies behind them, and, as shown by recent explorations of M. Hostains and others (1897-1900), closely approaches the headwaters of the St Paul. The lower courses of many of the smaller streams were explored by Büttikofer in 1879-82, but in few cases does our knowledge extend more than 25 miles from the coast, except in the case of the Sinoe, which was ascended in 1869 to the neighbourhood of the Gedeye mountains. A range named Nieta is also reported by M. Hostains west of the Upper Kavalli, and mountains are said to exist near the source of the rivers St John and Lofa. The courses of all the rivers are more or less broken by rapids, and even on the St Paul the limit of navigation is less than 50 miles from the sea. All have bars at their mouths, those of the Manoh, Lofa, and St Paul being almost impassable, communication between the sea and the last named being effected by a channel leading from the Mesurado lagoon.

Limits.—The boundaries, previously indefinite, have now been regulated by agreement with Great Britain and France. That towards Sierra Leone was laid down in 1887 as first following the left bank of the Manoh, and afterwards a continuation of the line to the north-east. The north-eastern and south-eastern frontiers were broadly defined by agreement with France in 1892 (ratified 1894). On the coast the boundary is the Kavalli, Liberian claims to the country east of its mouth being abandoned, while France waived her supposed rights to points within the Liberian limits. The interior frontier, running as it does through country unknown at the time of the Convention, had not in 1902 been demarcated, and may require revision. It was to follow the Kavalli to 6° 30' N. (the river being supposed here to be in 6° 52' W.), and then to run west along that parallel to its intersection with 7° 40' W.; to follow this meridian to 7° N. and then run in a straight line to the intersection of 8° 40' W. with the parallel passing through Tembi Kunda; and finally to follow the latter to the Sierra Leone frontier. Certain stipulations, however, might prove inconsistent with the line thus laid down; France, e.g., receiving the whole upper basin of the Niger, as well as that of the Fodedugu, a supposed upper branch of the Kavalli. The area of Liberia within the above limits is about 45,000 square miles.

Population.—Down to 1887 the American Colonization Society, which introduced the first settlement of freed slaves in 1820-22, is said to have spent over 2½ million dollars, and to have introduced from America some 12,000 coloured immigrants, over 1200 in addition having been brought by the Maryland Society. The number of the civilized negroes has been estimated at from 40,000 to 60,000, while the remaining black population is put down at a minimum of 2,000,000. The population of Monrovia, the capital, is about 5000; of Harper (with suburbs), 8000; of Buchanan (Grand Bassa) and Edina (on opposite sides of the river St John), 5000; and of Robertsport, 1200. At these ports, with Marshall (Junk river), Sesters River, Greenville, Settra Kru, and Half Cavalla, foreigners are allowed to trade.

Government.—The President and Vice-President of the Republic are elected by universal suffrage for a period of two years. The President controls the whole Government, and can dissolve the chambers at will; the Vice-President presides over the Senate, but takes the place of the President in case of the latter dying or going out of office before the expiration of his proper term. The cabinet consists of seven members, who are at the head of the seven departments of State. The Senate consists of nine members, two each for the counties of Bassa, Sinoe, and Maryland, and three for that of Mesurado, which contains the capital. The House of Representatives consists of thirteen members, one more for each county than are returned for the Senate. At the end of each session the two chambers meet jointly to pass the Bills which have been brought in before each of them. The judicial functions are discharged by four grades of officials, the local magistrates, the courts of common pleas, and the quarterly courts (one to each county town), and lastly the Supreme Court, presided over by the Chief Justice. The local administration is in the hands of superintendents, one each to the counties of Bassa, Sinoe, and Maryland, and one to each of the districts into which Mesurado is divided. Many parts, however, even along the coast, and all the interior more than 50 miles from the sea, are almost entirely beyond the influence of the Government. Schools exist in all the towns and villages, but, except at the West African College at Monrovia, the education given is very indifferent. In 1894 the revenue was estimated at £33,096 and the expenditure at £31,661.

Products and Trade.—Coffee is still the principal product, but the great fall in price and the insufficient preparation of the crops have lately ruined many cultivators. Experiments have since been made with the planting of cacao and caoutchouc. Wild rubber exists in large quantities in the forests. There are no industries on a large scale, though various civilized trades are carried on by the Liberians. Gold is said to exist, as also agates, rubies, and other precious stones. The foreign trade, though showing a decline, is still considerable, the largest share being in the hands of the Germans, while most of the remainder is divided between Great Britain and Holland. The principal lines of steamers run from Hamburg and Liverpool. The imports consist of articles of dress, food, &c., for the civilized negroes, and cotton goods for the native tribes. The principal exports are coffee, rubber (a monopoly of the English company called the Liberian Rubber Syndicate), piassava or raphia fibre (used for making brooms), palm oil and kernels, and a small amount of African mahogany. In addition to the Krumen, who engage themselves as crews of vessels, a large number of the natives of Liberia, especially the Vais, Golos, Bassas, and some Mandingos, emigrate to other parts of West Africa for labour on plantations, or for railway construction, or as police or militia. The majority go to Cameroon and Congo Free State.

Libourne, chief town of arrondissement, department of Gironde, France, 26 miles east-north-east of Bordeaux, on the railway from Paris to Bordeaux. Vineyards cover about 120,000 acres in the arrondissement. There are no textile manufactures of importance. The general coasting trade is brisk. In 1900, 283 coasting vessels entered and 308 cleared, total tonnage 20,939. Population (1881), 12,539; (1901), 19,175.

LIBRARIES.

THIS article is supplementary to that in the earlier volumes (ninth edition) of the *Encyclopædia Britannica* (1882), to which readers are referred for all historical particulars. The statistical tables appended to the article in vol. xiv. supplied details of 779 libraries (exclusive of those in the United States), containing about 50,225,000 volumes. All the libraries in the United Kingdom and its colonies were noticed, including those established under the Public Libraries Acts; but as regards the rest of the world, only those of 30,000 volumes and upwards, with a few exceptions, were described. The latter included 399 libraries, numbering 40,751,000 volumes. Taking the same limit of size, there were in 1902 outside the British islands, and excluding British colonies and the United States (see below), 595 libraries of 30,000 volumes and upwards, estimated to contain 61,378,000 volumes.

The following statistical abstract covers the same ground, with the same limitations and exceptions:—

COUNTRY.	1881.		1901.

THE UNITED KINGDOM.

The organized public libraries of Great Britain and Ireland in 1902 numbered 1341, containing 18,470,000 volumes; of these 677 were governmental, or belonged to universities, colleges, cathedrals, or societies and institutions, or were endowed or proprietary, and possessed 11,942,000 volumes. Since 1880 there has been an extraordinary growth in public libraries supported by the rates.

The number of towns and places possessing these institutions in Great Britain and Ireland increased from 96 to 444. In 1881 not one of the capital towns of the three kingdoms had adopted the Public Libraries Acts, with the single exception of Westminster (London). Dublin possesses municipal libraries, Edinburgh has enforced the provisions of the Acts, and Greater London in 1902 had established 70 or 80 libraries or branches. In 1880-81, eighty-one libraries in the United Kingdom returned their contents at 1,448,192 volumes. The rate-supported libraries and their branches in 1902 included about 6,528,000 volumes. Many of these libraries owe much to the munificence of generous benefactors, among whom the names of Mr John Passmore Edwards¹ and Mr Andrew Carnegie (*q.v.*) should not be forgotten. To some are attached art galleries and museums. In others courses of instruction are given and lectures delivered. Nearly all possess collections of books, pamphlets, and prints of local interest. Many have special juvenile and ladies' rooms. Some kind of indicator to inform the reader whether the book he desires to borrow is available or not is largely used. In other libraries, notably at Clerkenwell (London) and Croydon (Surrey), a system of "open access" of readers to books has been found successful.

[Many interesting facts respecting British libraries, with tables of the progress and actual condition of municipal libraries, are to be found in the *British Library Year Book, 1900-1*, by T. GREENWOOD; also J. J. OGLE, *The Free Library* (1897). Refer also to the article in these volumes on SOCIAL PROGRESS, *Libraries*.]

The following towns and places in the United Kingdom have adopted the general Acts, or have started libraries under local Acts; the dates of adoption are given within parentheses. In some places special legislation has been obtained to enable a higher rate than a penny in the pound (the authorized maximum) to be levied.

Aberdare (1901); Aberdeen (1884); Abergavenny (1900); Aberystwith (1874); Accrington (1899); Acton (1898); Airdrie (1853); Alloa (1885); Altrincham (1889); Andover (1896); Arbroath (1896); Arlecdon (1891); Ashton-on-Mersey (1896); Ashton-under-Lyme (1880); Aspatria (1902); Aston Manor (1877); Atherstone (1895); Ayr (1890); Banbridge (1890); Banff (1899); Bangor, Wales (1871); Barking (1888); Barnsley (1890); Barrow-in-Furness (1881); Barry and Cadoxton (1891); Bath (*Local Act*); Bebbington (1894); Bedford (1889) [Acts not put in force]; Belfast (1882); Bexley, Kent (1896); Bideford (1877); Bilston (1870); Bingley (1890); Birkenhead (1856); Birmingham (1860); Blackburn (1853); Blackpool (1879); Blackrock (1900); Blaenau Festiniog (1894); Bodmin (1895); Bolton (1852); Bolton Percy, Yorks (1895); Bootle (1884); Bournemouth (1893); Bradford (1871); Bray, Ireland (1899); Brechin (1890); Brentford (1889); Bridgend (1901); Bridgwater (1860); Brierley Hill (1875); Brighouse (1897); Brighton (1850-91, *Local Act*); Bristol (1874); Bromley, Kent (1892); Broughton, Wrexham (1895); Brynmawr (1897); Buckley (1902); Burnley (1898); Burslem (1863); Burton-on-Trent (1895); Burwell, Cambs (1895); Bury (1897); Bury St Edmunds (1895); Buxton (1886); Camborne (1894); Cambridge (1853); Campbeltown (1896); Canterbury (1858); Cardiff (1862); Carlisle (1890); Carlton, Notts (1888); Carnarvon (1887); Castle Douglas (1902); Chatbam (1893); Cheltenham (1883); Chester (1874); Chesterfield (1875); Chesterton (1897); Chiswick (1890); Chorley (1897); Clackmannan (1901); Claydon, East, and Botolph (1897); Claydon, Middle (1893); Claydon, Steeple (1901); Cleator Moor (1892); Cleethorpes (1900); Clitheroe (1878); Clonmel (1898); Clontarf, Dublin (1901); Coatbridge (1901); Colchester (1891); Coleraine (1881) [not carried into effect]; Colne (1894); Colwall (1898); Conway (1899); Cork (1855-92); Corwen, Wales (1896); Coventry (1867); Creich (1899); Croydon (1888); Dalkey (1894); Dalton-in-Furness (1899); Darlston (1875); Darlington (1883); Darwen (1871); Denton and Haughton (1887); Derby (1870); Devonport (1880); Dewsbury (1887); Dingwall (1902); Doncaster (1868); Douglas, I. of M. (1886); Drumcondra (1900);

¹ Mr Passmore Edwards (born in Cornwall, 1824) was for some years proprietor of the London *Echo*, and from 1880 to 1885 sat as a Liberal in Parliament for Salisbury. In later life he was a prominent donor of funds not only for libraries but also for convalescent homes and hospitals.

(1860); Stockton-on-Tees (1874); Stoke-upon-Trent (1875); Stornoway (1898); Stratford-on-Avon (1902); Stretford (1893); Stromness (1900); Stroud (1896); Sunderland (1860 *Local Act*); Sutton-in-Ashfield (1898); Swansea (1870); Tain (1899); Tamworth (1882); Tarbat (1899); Tarves (1883); Teddington (1896); Thornaby-on-Tees (1890); Thurso (1872); Tipton (1883); Todmorden (1896); Tonbridge (1882); Tottenham (1891); Trimdon (1895); Trumpington (1898); Truro (1886); Tunbridge Wells (1895); Tunstall (1885); Twickenham (1882); Tynemouth (1869); Wallasey (1898); Walsall (1857); Walthamstow (1892); Warrington (1848, *Museums Act*); Warwick (1865); Water Eaton (1896); Waterford (1894); Waterloo-with-Seaforth (1892); Watford (1871); Wednesbury (1876); Welshpool (1887); West Bromwich (1870); West Ham (1890); Weston-super-Mare (1886); Whitechurch (1900); Whitehaven (1887); Wick (1887); Widnes (1885); Wigan (1876); Willenhall (1877); Willesden (1891) [includes Kilburn, Harlesden, and Willesden Green]; Wimbleton (1883); Winchester (1851); Winsford (1887); Wolverhampton (1869); Wood Green (1891); Woolton (1890); Worcester (1879); Worthing (1890); Worksop (1895); Worthing (1892); Wrexham (1878); Yarmouth, Great (1885); York (1891).

[From list in *Library Association Year Book*, 1901, corrected to 1902.]

By the Public Libraries Act of 1892 all the Acts from that of 1855 to the Amendment Act of 1890 were consolidated in an amended form. This Act, which was promoted by the Library Association, simplified the steps necessary for the establishment of libraries; it also gave additional administrative powers to the library authority.

Law relating to public rate-supported libraries.

It settled some difficult questions as to the polling of ratepayers for the adoption of the Acts and the levying and collection of the library rate. Facilities were also afforded whereby neighbouring localities might combine for library purposes. A short Act passed in 1893 provided the first step towards placing directly in the hands of the elected representatives of the ratepayers the right of adopting the Acts, which had hitherto been subject to the popular vote. At first this change applied only to the urban district authorities, but the Local Government Act of 1894 gave somewhat similar powers to rural parishes, and further extended the means for combination, particularly helpful in the case of small districts with limited financial resources. In 1898 an Act was passed to provide for good order and the punishment of offences in libraries. The following year (1899) saw the passing of the London Government Act, which, in creating the metropolitan borough councils, gave to them the power of putting the Library Acts into force. In 1901 an Act promoted by the Library Association was passed which removed some difficulties in regard to rating, gave power for the making of by-laws, and applied the Museums and Gymnasiums Act of 1891 to the metropolis. In Scotland and Ireland library legislation has been dealt with principally by separate Acts, and the variety of enactments tends to create doubt and confusion. The Library Association, with the help of Lord Avebury, Lord Windsor, and others, has devoted many efforts towards remedying these and other defects, including the anomalous condition of the law in regard to libel as it affects libraries, and liability to assessment for rates and taxes. The penny rate limitation lies heavily upon the majority of libraries, although by means of special and costly legislation some have been enabled to rid themselves of the restriction.

Enactments and Regulations.

ENGLAND AND WALES.—Acts 55 and 56 Vict. cap. 53 (1892); 56 Vict. cap. 11 (1893); 61 and 62 Vict. cap. 53 (1898); 62 and 63 Vict. cap. 14 (1899); 1 Edw. VII. cap. 19 (1901).

Adoption.—(1) In City of London by a poll of the voters (1892, § 21). (2) In metropolitan boroughs (1899, § 4) and urban districts (1893, § 2) by a resolution of council. (3) In rural parishes by a parish meeting or, if demanded, a poll of the voters by ballot (1894, §§ 7 and 19). When adopted, notice must be sent to the Local Government Board (1901, § 8).

Library District.—City of London (1892, § 21), metropolitan boroughs (1899, § 4), urban districts (1892, § 1), parishes not in an urban district (1892, § 1).

Rate.—Not to exceed one penny in the £, with exceptions granted by local Acts of Parliament (1892, § 2). For list of these see *Library*, x. (1898), pp. 330-331. Museum expenses may be charged under the Museums and Gymnasiums Act, 1891, in addition to the penny rate (1901, § 7).

Authority.—In City of London: Common Council (1892, § 21). In metropolitan boroughs (1899, § 4) and urban districts (1892, § 4): the council. In parishes: parish council (1894, § 7), or where there is no parish council a committee (1894, § 19), or commissioners (1892, § 4).

Combination.—(1) Vestries (1892, § 9). (2) Parish and library districts (1892, § 10). (3) Urban districts (1893, § 4). (4) Library districts (1901, § 5). (5) Library authority and Charity Commissioners (1892, § 16).

Execution of Act.—Library authority may provide all or any: public libraries, public museums, schools for science, art galleries, and schools for art (1892, § 11).

Fees.—No charge for admission to library or museum or for use of lending library to the inhabitants of district, but use of lending library may be granted to persons not inhabitants of the district either gratuitously or for payment (1892, § 11).

Power to acquire and dispose of Land (1892, § 12).

General Management.—By library authority (1892, § 15). But an urban authority may appoint a committee, and delegate to it certain powers (1892, § 15). Persons appointed to be members of the committee need not be members of the urban authority (1892, § 15) nor of a London borough council (1899, § 8).

Expenses, how defrayed.—By a rate. See *Rate*.

Borrowing.—Authority may borrow on security of rate (1892, § 19).

Accounts and Audit.—Urban authority, as under Public Health Acts (1892, § 20). Commissioners, or parish authority, by district auditor (1892, § 20). Metropolitan borough, as London County Council (1899, § 14).

Bye-laws.—Authority may make. Penalties may be recovered under the Summary Jurisdiction Acts (1901, § 3).

Offences.—See also Library Offences Act (1898).

Damage to Buildings by Subsidence.—Not to be paid out of the penny library rate (1901, § 10).

SCOTLAND.—The Acts were amended and consolidated by the Public Libraries Consolidation (Scotland) Acts, 1887, 1894, and 1899.

IRELAND.—The original Act, 18 and 19 Vict. cap. 40, passed 1855, with amending Acts (1877, 1894). An Amending Act was in 1902 before Parliament.

[H. W. FOVARGUE and J. J. OGLE. *Public Library Legislation*, 1893. CHAMBERS and FOVARGUE, *Public Library Law*, 1899.]

The chief facts in the recent history of the great British national libraries may be briefly mentioned. The British

British Museum. Museum, which was estimated to include a million and a half of printed volumes and 50,000

MSS. in 1881, contained in 1902 upwards of two millions of printed volumes and 55,000 MSS., besides charters and rolls. The chief event in the later history of the institution was the completion in 1900 of the printing of the entire catalogue of the library, commenced in 1881. A supplement including the titles of all books added to the library while the general catalogue was in progress was also begun. Since 1888 the titles of new books are incorporated in the catalogue every fortnight. By the introduction of sliding presses in 1887 the space for the accommodation of books will eventually be more than doubled. The map catalogue has been completed; a revision of the rules for cataloguing has been issued. A special catalogue of English books printed before 1640 (1884), a synopsis of the French Revolutionary tracts (1899), and various excerpts from the printed catalogue have been published. There has been a marked improvement in the printed guides to the exhibited portion of the collection since 1890. In 1892 a separate department of Oriental books and MSS. was formed. The valuable *Subject Indexes of Modern Works*, prepared by Mr G. K. Fortescue, and Mr Robert Proctor's *Index to Early Printed Books* (not an official work), deserve special mention. A subject-index of all the books in the library published between 1881 and 1900 was passing through the press in 1902, and the question of compiling class catalogues of the entire library was under consideration. In the department of MSS. there have been most important

acquisitions in all branches, especially in papyri of classical authors from Egypt, including "Aristotle on the Constitution of Athens," "Herondas," "Bacchylides," published by the Trustees, numerous other papyri from Professor Flinders Petrie, Mr Jesse Haworth, and others. Among the most important of other acquisitions are the duke of Newcastle's papers, presented by the earl of Chichester in 1886; the Hardwicke MSS., purchased from the earl of Hardwicke in 1899; the Asburnham MSS., chiefly historical, 1883; the Nelson papers of Viscount Bridport, 1895-97; the Gibbon papers, 1895; the Sforza Book of Hours, bequeathed by John Malcolm, Esq., of Poltalloch, 1893; MSS. of Keats, from his sister Señora Llanos, and the autograph MSS. of some of George Eliot's works, from Mrs C. L. Lewes. The department has published catalogues of papyri, of Spanish MSS., of romances, and of seals. The Oriental department has published catalogues of Arabic and Indian books.

The Bodleian Library at Oxford contained in 1902 over 600,000 printed volumes and 31,000 MSS. The rate of increase is now considerably augmented, and the number of items received annually—including **Bodleian.** separate maps, parts of periodicals, &c.—exceeds 60,000, equivalent to about 17,000 volumes. A special feature of it is the entire body of dissertations or theses issued in the universities of Germany, Holland, Norway, Sweden, Denmark, Switzerland, and France. Since 1881 the further development has been very considerable. The number of week-days in the year during which the entire library is closed has been reduced from 29 to 6. The open reference-libraries in both reading-rooms have been materially increased. A very minute shelf-classification for current accessions was begun in 1883, and the corresponding shelf-lists are virtually subject-catalogues of the literature acquired since then. At the same time the preparation of a subject-catalogue of the entire library (compiled from a spare set of slips manifolded for the ordinary catalogue) has made great progress. A rough catalogue of *incunabula* (the work of Mr E. Gordon Duff and Mr R. Proctor) has also been formed. Six more volumes of catalogues of MSS. have been published, and considerable additions have been made to the collections of Sanskrit, Armenian, Hebrew, and Tibetan MSS. All current accessions of MSS. are now divided by language, with a subdivision by subject in the case of English, Latin, and Greek. The coin collection—the second largest in the empire—has been almost entirely reorganized; it numbered over 60,000 pieces in 1902. During the period under review the Savile and Music School libraries were added to the Bodleian, five colleges deposited their MSS. in it, and an important deposit collection was received from the Clarendon Press. The area occupied by the library includes the basements of the Sheldonian Theatre and of the Old Ashmolean building. The lending of volumes has been restricted by statute, so as to require the sanction of Convocation of the University: it may be said that printed books are never lent, and of manuscripts (never of prime value) only some half-dozen a year. The number of readers, both ordinary students and those engaged in research, has largely increased. In 1889 the gallery of the Radcliffe Camera was opened as an addition to the reading-room in that building. The three-hundredth anniversary of the opening of the Bodleian Library was in October 1902.

The contents of the University Library at Cambridge are estimated (perhaps excessively) by the University Calendar at half a million of volumes, but no enumeration has been made officially. The *Cambridge University.* *incunabula* are about 2150, being especially strong in books printed in Holland and Belgium and in Cologne. The MSS. number 7872, exclusive of the Taylor-Schechter collection of Hebrew documents and fragments

from Cairo, and of the Buxton collection of Norfolk court rolls, &c. The following catalogues of MSS. have been published: Persian (E. G. Browne), Syriac (W. Wright and S. A. Cook), Hebrew, vol. i. (S. M. Schiller-Szinessy), Hand-list of Mahomedan MSS. (E. G. Browne). Among recent additions are the Chinese library of the late Sir T. F. Wade, catalogued by Professor H. A. Giles; the library of H. Bradshaw, 1870 and 1886 (Irish, chiefly before 1800, probably 7000 numbers); R. Bensly's Oriental books and manuscripts, J. Venn's logic collection, J. C. Adams's collection of early printed mathematical works, Samuel Sandars's *incunabula*, early English, liturgical, books on vellum, &c. Volumes i. and ii. of the catalogue of English books before 1640, by C. Sayle (reaching No. 5909), had been published up to 1902.

The Advocates' Library in Edinburgh now includes 455,000 printed volumes and 3200 MSS. In 1884 an addition was made to the building capable of holding 85,000 volumes, and in 1899 a further extension to accommodate 380,000 volumes. The Signet Library now includes about 100,000 volumes. The third volume of the printed catalogue, with a subject index, was published in 1891.

The library of Trinity College, Dublin, in 1902 contained 255,000 volumes and 2027 MSS.; about 3000 volumes are added every year. The printed catalogue of books acquired before 1872 was completed in 1887, and a summary catalogue of the manuscripts has been published (1890).

The most remarkable instance of a great library established by private munificence is that of the John Rylands Library at Manchester, which was founded, erected, and endowed by Mrs E. A. Rylands in memory of her husband, and is contained in a magnificent building opened in 1899. The collection was formed largely on the famous Althorp Library, made by Earl Spencer (40,000 volumes), one of the most remarkable collections of early printed books and rare Bibles ever brought together. The present number of volumes is about 80,000, of which 2500 are *incunabula*. Over 5000 volumes, including many of great rarity, were added in 1901. A short-title catalogue, 3 vols. 4to, and one of English books, have been published. A supplement, describing about 25,000 books, was begun.

Since 1880 the usefulness of public libraries has been increased by the work of the Library Association, founded in 1877, during the first International Library Conference held in London in October 1877. A charter of incorporation was granted to the association in 1898. It holds monthly and annual meetings, publishes a journal, conducts examinations, issues certificates, holds classes for instruction, and has greatly helped to improve the public library law. The Library Assistants' Association publishes a journal. A second International Library Conference was held at London in 1897. Library associations have been started in Germany and Switzerland. The Library Association of Australia held its third annual meeting in 1901.

BRITISH COLONIES.

I. AUSTRALASIA.—In the Australasian states and colonies there were 1361 libraries in 1902 receiving a Government grant, and containing 2,552,995 volumes.

1. *Victoria* has 424 libraries, with 1,029,743 volumes. The Melbourne Public Library is the largest in Australasia (178,900 vols.). Among other libraries in Melbourne are—The Library of Parliament, for the use of members; the Supreme Court Library, with 24,000 vols., free to members of the legal profession; the Patent Office Library, with 7000 vols.; the Libraries of the University, the Royal Society, the Linnæan Society, the Royal Geographical Society, and other institutions.

2. *New South Wales* contains 350 libraries receiving Government aid, with 510,000 vols.; Sydney Public Library (151,141

vols.), with leading department for the benefit of country libraries; Sydney University Library (50,000 vols.); School of Art Library (60,000 vols.); a circulating library for subscribers.

3. *South Australia*.—Adelaide Public Library (46,266 vols.), with circulating system of book boxes; Parliamentary Library, Adelaide, for the use of members. Besides these, 160 country libraries with 220,538 vols.

4. *Queensland* contains 141 institutions, with 166,589 vols., mostly open to the public. Pending the opening of the Brisbane Public Library, the most important is the Parliamentary Library, Brisbane (31,835 vols.).

5. *Tasmania* has 45 libraries, with 90,000 vols.; Tasmanian Public Library, Hobart, 19,000; Launceston Public Library, 22,000 vols.; Parliamentary Library, for use of members.

6. *West Australia* has 55 literary institutions, with 24,000 vols.; Victoria Public Library, Perth (43,940 vols.).

7. *New Zealand* has 304 libraries, with 409,604 vols. There are no state libraries, but they are partly supported by rates and partly by subscription. The largest are Auckland Public Library (34,000 vols.), containing Sir George Grey's collection of 13,000 rare books and MSS.; Wellington Public Library; the Dunedin and Christchurch Libraries; the Parliamentary Library of Wellington (40,000), and several university libraries.

The Parliament of the Commonwealth of Australia intends to establish a Federal Public Library in the new capital, containing as a special feature works on Australasian history.

II. CANADA.—Between 1887 and 1902 the number of volumes accessible to the public in the Dominion increased by about 1,300,000. All the chief cities of the Dominion now possess fine public libraries. Two provinces—Ontario and British Columbia—have adopted a Public Libraries Act. Montreal has about thirty libraries, large and small, and Toronto about as many. Ottawa can draw upon the Parliamentary Library, which with those of the departments aggregate a quarter of a million volumes, and constitute the largest collection of books in the country.

The chief free public library in Canada is that of Toronto (110,000 vols.). The largest university library is that of Laval University, Quebec (110,000 vols.). Then follows McGill University, Montreal (81,000), with about 30,000 vols. of theological and patristic literature in its affiliated colleges. Travelling libraries have been organized in British Columbia. The Aberdeen Association, founded in 1890 through the instrumentality of the countess of Aberdeen, collects books for distribution in monthly parcels among settlers in outlying parts of the country. *Nova Scotia*—Halifax: Legislative Library (32,500 vols.), Dalhousie University (19,760), Citizens' Free Library (22,300), Garrison Library (15,000); Windsor: King's College (7500); Wolfville: Acadia College (8500). *New Brunswick*—St John: Free Library (12,000); Fredericton: Legislative Library (15,000), University of New Brunswick (8500); Sackville: Mount Allison College (8500). *Quebec (Province)*—Montreal: Fraser Institute (35,000), Château de Ramezay (6000), Montreal Free Library (20,000), Westmount Free Public Library (2500), Bibliothèque Paroissiale de Notre Dame (16,000), Mechanics' Institute (14,000), Grand Trunk Literary and Scientific Institute (7000), Ecole Normale Jacques Cartier (12,500), McGill University (including medical works, 81,000), four college libraries affiliated with McGill University, viz., Presbyterian (16,000), Congregational (3500), Diocesan (4700), Wesleyan (3000), Montreal College (Roman Catholic) (45,000), St Mary's (Jesuit) College (32,000), Seminary of St Sulpice (70,000), Natural History Society (6000), Advocates' Library (17,000), New York Life Law Library (6500); Quebec (city): Laval University (110,000), Legislative Library (50,000), Department of Public Instruction (11,000), Bar Library (13,000), Literary and Historical Society (19,000), Sherbrooke: Art Institute and Public Library (4000); Knowlton: Pettes Memorial Library (1400); Lennoxville: Bishop's College (7500); Stanstead: Public Library (3000); St Hyacinth: Collège de St Hyacinth (25,000); Ste Anne de la Pocatière: Collège de Ste Anne (13,000); Three Rivers: Seminaire des Trois Rivières (7000). *Ontario*—Toronto: Public Library (110,000), University Library (60,000), Legislative Library (70,000), Law Society of Ontario (30,000), Meteorological Office (Governmental) (5000); Kingston: Queen's University (36,000); Ottawa: University (35,000), four Governmental libraries, viz., Library of Parliament (200,000), Geological and Natural History Survey (16,000), Supreme Court (19,500), Archives (10,000). *Manitoba*—Winnipeg: Legislative Library (17,500), Literary and Historical Society (15,000), University of Manitoba (8000), Law Society (6000). *North-West Territories*—Regina: Legislative Library (3500). *British Columbia*—Victoria: Legislative Library (6000), Law Library (2000), Public Library (5000); New Westminster: Public Library (1500); Vancouver: Public Library (1000).

Summary of Canadian Libraries.

	Libraries.	Volumes.
Nova Scotia	9	90,000
Prince Edward Island	2	7,500
New Brunswick	6	50,500
Quebec	47	690,500
Ontario (including 5 Governmental libraries)	444	1,537,500
Manitoba	4	46,500
North-West Territories	1	3,500
British Columbia	5	17,000
	518	2,443,000

III. AFRICA.—*Cape Colony* has 126 libraries, with 421,732 vols., the chief being those of Cape Town (66,753 vols.), Graham's Town, Port Elizabeth (25,073 vols.); King William's Town (16,987 vols.); Kimberley (23,843 vols.); East London (7774 vols.); Cradock (7147 vols.); and Graaff-Reinet (8669 vols.). There is also a Parliamentary library in Cape Town (12,000 vols.).

Natal.—The Natal Society's library, Pietermaritzburg (11,500 vols.); a Parliamentary library, also at Pietermaritzburg; and a public library at Durban (12,000 vols.). There are also small libraries in the country districts.

IV. WEST INDIES.—The Institute of Jamaica (11,000 vols.); Trinidad Public Library (20,000 vols.); Nassau Public Library, Bahamas (13,000 vols.); Royal Agricultural and Commercial Society, British Guiana (20,000 vols.); Berbice Reading Society (5000 vols.); the Public Library of Grenada (4000 vols.); Public Library, St Lucia (3000 vols.).

V. EASTERN COLONIES.—*Ceylon* has 24 libraries, 4 of which are in Colombo. *The Straits Settlements* has 4 libraries (2 in Singapore and 2 in other parts of the colony). *Hong-Kong* has 2 libraries. *Mauritius*.—Public Library of Port Louis (12,000 vols.).

[See "The Libraries of Greater Britain," by J. R. BOOSÉ, in *The Library*, 1901; for Canada paper by J. BAIN (Public Library of Toronto) read at Montreal Library Conference 1900, with additional information from G. H. GOULD, McGill University Library, Montreal.]

GERMANY AND AUSTRIA-HUNGARY.

There are two libraries in Germany, Berlin and Munich, of nearly a million volumes, one of 600,000 volumes (Hamburg), two possessing about half a million (Göttingen and Leipzig). The following contain between a quarter and half a million volumes: Bamberg, Bonn, Breslau, Darmstadt, Dresden, Frankfurt on the Main, Freiburg in Bregau, Heidelberg, Munich (Univ. Lib.), Rostock, Stuttgart, Tübingen, Wolfenbüttel, and Würzburg. Libraries extending from 200,000 to 250,000 are at Augsburg, Gotha, Halle, Jena, Kiel, Königsberg, Mainz, Schwerin, and Weimar. Since 1892 the Royal Library at Berlin has issued a weekly accession list. A combined general catalogue of the great Prussian libraries, including since 1898 all the university libraries, is being compiled.

The largest collections in Austria-Hungary are the Royal Library (900,000 vols.) and the University Library (576,000) at Vienna, the Hungarian National Museum (400,000); and the University Library (222,000) at Budapest, and the Museum (200,000) and the University Library (269,000) at Prague.

FRANCE.

The Bibliothèques Municipales in the various departments are about 338, with an aggregate of 8,500,000 volumes. Within the period from 1879 to 1899 a million and a half of books and pamphlets were added. The various university libraries contain about 906,600 volumes. The number of Bibliothèques Populaires is a floating quantity, as many have but a brief existence. It is believed that the Bibliothèque Nationale possesses about three millions of volumes, a total which probably includes a great quantity of pamphlets reckoned as volumes. The separate entries in the catalogue of printed publications are close upon two millions. There are besides 250,000 maps, over 100,000 MSS., 250,000 engravings, and 150,000 coins and medals. The number of entries between 1879 and 1899 was 800,000. The most important work within recent years has been the preparation of the great general printed catalogue in octavo form, and the valuable

publications of M. Delisle on French and Latin MSS. The other great Paris libraries are: Bibliothèque de l'Université de Paris (430,358 vols.); B. Sainte Geneviève (300,000 vols.); B. de l'Arsenal (250,000 vols.); B. Mazarine (200,000 vols.). (H. R. T.)

THE UNITED STATES.

The early history of public libraries in the United States, and the statistics down to 1876, will be found in the earlier article in vol. xiv. (p. 534) of the *Ency. Brit.* (ninth edition). The progress since that date has included an extraordinary activity (1) in the creation of additional rate-supported libraries of the customary type; (2) in the establishment of libraries by private gift, to be maintained wholly or in part by endowment; (3) in the extension of state aid to the establishment of libraries designed for local service, and of the counsel of state authorities in their administration; (4) in the construction of new library buildings of elaborate design; (5) in the organization of persons engaged in library work or interested in public libraries as a part of the educational system of the country into associated effort for the study of library economy, for the discussion of problems of library administration, and for the furtherance in general of the library movement; and (6) in the establishment of systematic instruction for library work.

Statistics.—Statistics of individual libraries of note are appended in a table. From time to time the United States Bureau of Education has compiled statistics of public, society, and school libraries in the United States, which show not only the wide extent of library facilities, but also a remarkable growth in recent years. Some of the main results of these inquiries may be noted.

Year.	Libraries of 1000 volumes and over.		Increase per cent.		Libraries of 300 volumes and over.	
	Number.	Volumes.	Number.	Volumes.	Number.	Volumes.
1875	2039	11,487,778	3648	12,329,526
1885	2988	19,401,199	46·5	77·6	5338	20,722,393
1891	3503	25,977,643	17·2	33·9
1896	4026	33,051,872	14·9	27·2	7184	34,596,258
1900	6383	44,591,851 ¹	33·7	34·9	9261	46,610,509

¹ Exclusive of pamphlets, reported as 7,503,588.

It will be noted that the libraries having 1000 volumes were about two and a half times as numerous in 1900 as twenty-five years previously, while in the same period their contents had increased nearly fourfold. The above statistics include society and school libraries, these being "public" and very generally free for reference use. Of the 5383 libraries of 1000 or more volumes reporting in 1900, 1979 were classed as "general," 1725 as "school," and 689 as "college." Four had 500,000 volumes or over; three, 300,000 to 500,000; forty-seven, 100,000 to 300,000; ninety, 50,000 to 100,000; and the remainder fell below 50,000. The distribution by groups of states was as follows: North Atlantic, 2473; South Atlantic, 421; South Central, 374; North Central, 1728; Western division, 387. In general, throughout the United States there is one library having 1000 volumes for every 14,118 persons, though in the North Atlantic states they are as many as one for every 8510, while in New England the number is still greater. New Hampshire leads with one library for every 2878. More significant perhaps are figures in relation to the books. In the country at large the libraries contain 59 books for every 100 people. In the North Atlantic states the books outnumber the people, being 111 of the former for 100 of the latter; in Massachusetts, indeed, the number is as high as 236 for every hundred persons. In these comparisons with the population the extreme Western states as a group make a better showing than the average of the nation, while other groups fall below it. This is due in a large measure to the influence of California, which compares favourably with the Eastern states both in the number of its libraries and their size.

Income.—988 libraries reported an income for the year 1900 of \$2,213,755 from taxation; 1016, an income of \$2,349,294 from state, county, and city appropriations; while 714 reported an income of \$1,198,955. Other sources of income are reported, while a large number failed to specify the sources of income. The aggregate income reported by 3115 libraries was \$7,812,406. 645 libraries reported endowment funds aggregating \$25,267,643.

710 libraries reported the value of their buildings to be \$47,083,805, while 2972 reported an expenditure for books during the year of \$2,056,675.

Use.—During the year 1900 the records of 2405 libraries show 48,410,128 books issued for home use. The reference use is imperfectly recorded. Free access to shelves, at least to reference cases, and to periodicals, make a complete record impracticable, and there are only 783 libraries which make any report of books issued for use in the library (9,609,632). If all such use could be recorded and reported, it seems probable that the books used in the buildings would exceed those used at home. Circulation for home use reaches its highest point in the large cities, especially where the free libraries have a number of branches. Thus in Philadelphia and Chicago the circulation in 1900 reached one and three-fourth million books. The free circulating library of New York City circulated a million and a half of books, while the Boston Public Library and its branches had a circulation exceeding one and a quarter million. Several other city libraries have a circulation exceeding 500,000. These statistics, although imperfect, indicate a development unexampled in the history of education. This development has been fostered by legislation. In the fifty states and territories there were included in the report of 1900 before quoted only eleven in which libraries were not supported by taxation levied directly for such purpose. One of these—Delaware—has since passed a law authorizing taxation for the support of public libraries. The state of New Hampshire in 1897 enacted a law which, proceeding one step farther, made obligatory the establishment of free libraries by towns of a certain size. This carries to its extreme limit the theory, now generally accepted in the United States, that a free public library ranks with the common school as an agency for popular education whose maintenance is a duty of the community as a whole to its members. In certain towns the board of library commissioners is vested (by statute) with the authority to specify directly the amount to be levied for library purposes, being limited only to a certain maximum percentage of the assessed valuation. In general, however, the appropriations are made by the town councils.

State Library Commissions.—Twenty-one states, beginning with Massachusetts in 1890, have established commissions, which, acting on behalf of the state, encourage the formation of local libraries, particularly in towns and villages, and in many cases have authority to aid their establishment by the grant out of the state funds of a certain sum (usually \$100) towards the purchase of books, upon the appropriation of a similar sum by the local authorities. These commissions are prepared to aid further with select lists of desirable books, and with suggestions or advice in the problems of construction and maintenance. Such commissions are in existence in Connecticut, Delaware, Georgia, Idaho, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Vermont, Washington, and Wisconsin. In Massachusetts the efforts of the commission have been so successful that of the 346 towns and cities in the state only seven at present lack public library privileges. The report of the commission for 1899, together with the report of the Connecticut commission of 1895, affords a very full statement of the progress of the typical town library in New England. The result of fostering legislation is seen in the greater portion of free rate-supported libraries established since 1875, as against those established during the preceding twenty-five years. From 1850 to 1875 the number was but 257, as against 1983 professional, society, school, and college libraries. The present tendency is either to the discontinuance of proprietary libraries of the older type—excluding the Y. M. C. A. and the fraternity libraries and those merely professional—or to their merger with the free town library. Those now remaining independently prosperous are to be found chiefly in the large cities—for example, the Boston Athenæum, the Mercantile of New York, and the Brooklyn.

Travelling Libraries.—In certain of the states the state authorities, acting usually through the state commissions, maintain at the expense of the state collections of books, which are despatched to various localities upon application from the local authorities, remaining during a fixed period in each locality for the benefit of the residents there, and then being withdrawn and forwarded for service elsewhere. This system of travelling libraries, inaugurated in New York state, and having its most elaborate development there, is now in existence in at least twenty-one states—Alabama, Colorado, Delaware, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, New York, Ohio, Michigan, Minnesota, Missouri, New Jersey, Pennsylvania, Texas, and Wisconsin. To the service of books is sometimes added that of photographs, lantern-slides, and other illustrations. Communities are reached by these travelling libraries (as in Wisconsin) remote from the book centres, and either ignorant of the stimulus of books or unable to afford it.

Endowments.—The creation and endowment of public libraries by private gift has kept pace with their establishment at the

public expense. An annual report of donations to libraries is presented at the meeting of the American Library Association. The report for 1900-1 showed money gifts in the United States for general library purposes of \$3,616,962, and for buildings, \$15,217,702. Gifts of material aggregated 145,361 volumes. The total money value of gifts and bequests of money, buildings, and lands for library purposes since 1876 is estimated at nearly \$60,000,000. Mr Carnegie's gifts alone have exceeded \$20,000,000, and in 1901 he gave \$5,200,000 to New York City for the erection of sixty-five branch libraries. Among other notable gifts of individuals have been the following:—Enoch Pratt, gift to Baltimore, \$1,083,333; Walter L. Newberry, bequest to Chicago, \$3,000,000; Samuel J. Tilden, bequest to New York, \$2,125,000; John Crerar, bequest to Chicago, \$2,714,191; Seth Low, gifts to Columbia, say \$1,000,000. The gift of Enoch Pratt to Baltimore was a lump sum towards the establishment of the library, construction of the buildings, &c., with the condition that the city should appropriate for maintenance expenses a certain sum annually. This is a favourite form of gift, and was followed by Mr Carnegie in most of his benefactions. The Tilden, Newberry, and Crerar bequests went to the foundation of libraries which, while free, are administered by private corporate bodies.

Library Buildings.—The multiplication of these, both by private gift and at the public expense, has been extraordinary. In the smaller towns library buildings, costing from \$5000 to \$50,000, have now become the most popular form of memorial; pictures are given in the reports of the Massachusetts and Connecticut library commissions. Of the large buildings the result of gift, some of the most prominent are the Columbia University Library at New York (the gift of its president, at a cost of nearly \$1,000,000); that of Pittsburg, a composite building, costing, with branches, \$2,800,000, the gift of Mr Carnegie; the new library of Princeton University, costing \$600,000, the gift of W. Taylor Pyne; that of Cornell, costing \$250,000, the gift of Henry W. Sage (who added an endowment of \$300,000); and that for the public library at Providence, Rhode Island (the gift in part of John Nicholas Brown). Of other buildings for libraries of intermediate size, those erected at Milwaukee and at Madison, Wisconsin, and at Newark, N.J., are specially interesting, from their provision for administrative needs complex in character. Of larger buildings, erected at the expense of municipalities for municipal libraries, that at Boston (completed 1895) cost \$2,500,000; that at Chicago (completed 1897), \$2,000,000. The culmination of buildings of this type will be that for the New York Public Library—larger, more elaborate, and doubtless more costly than either of the foregoing. The most ambitious of existing library buildings is that erected by the Federal Government for the library of Congress at Washington, and opened in 1897. It covers 3½ acres of ground, contains 10,000,000 cubic feet of space, and has possible accommodation for over four million volumes. Its cost was \$6,500,000, or including the land, \$7,000,000. It is the largest, most ornate and most costly building in the world yet erected for library purposes. The library itself is now likely to become worthy of the building as the National Library of the United States. It contains already the largest mass of material of any library on the western hemisphere (see Table). The total appropriations in its behalf for the year 1900-1 reached \$563,000. This included \$75,000 for printing and binding, and \$156,000 for furniture and shelving and the care and maintenance of the building and grounds. \$71,000 was for the purchase of books and other material. The advantage of combining under one roof institutions cognate in aim or related in activity has led to the construction of certain buildings composite in character, containing provision for museums, art galleries, and perhaps music halls and society rooms. Examples of such are at Allegheny, Buffalo, Madison, Milwaukee, Minneapolis, Pittsburg, and elsewhere. Not merely in number, but from an artistic standpoint, the library buildings erected since 1880 are, as a class, amongst the most notable achievements of American municipal architecture.

Administration.—In the United States the tendency is constant towards the removal of restrictions upon use. In almost no case is any credential required as a preliminary to reference use. The deposit or guarantee, formerly a condition precedent to the withdrawal of books for home use, is no longer universally exacted; at Boston, for instance, a simple reference to a second resident (who assumes, however, no responsibility) is all that is required. In spite of this waiver of security, the annual loss to the library, out of a circulation of 1,200,000 volumes issued for home use, is less than 100 volumes unaccounted for, the money value of which would not exceed \$100. Direct access to the shelves is increasingly granted, not merely for purpose of reference, but for the selection of books for home use. Special provision for younger readers is a feature in all of the libraries undertaking a popular service, and children's reading-rooms, with direct access to a selected collection of books, are now provided in all the buildings erected for such libraries. A special educational service, highly developed of late

years, involves co-operation with the common schools in the supply to teachers and pupils of books, special topical lists, and special facilities for collateral and supplementary reading. In this way the library is closely associated with the common educational system, becomes auxiliary to the schools, and develops a constituency of readers early trained to its use. In the larger cities the facilities of the central library are supplemented by branches and delivery stations; the former containing permanent collections of books issued independently, the latter serving as conduits through which books are issued from the central collection. The system of branches has been developed more particularly in Baltimore, Philadelphia, and Pittsburg; that of delivery stations and branch reading-rooms at Chicago and St. Louis, and a composite system at Boston. For Chicago there are provided over forty delivery stations; at Boston, ten branches—five branch reading-rooms and thirteen delivery stations. Such cities support, therefore, not a mere library, but a *system* of libraries.

Library Associations.—The American Library Association, formed in 1876, has continued uninterruptedly, and now numbers over 500 members. It holds annual conferences at different places. It has done much to stimulate the interest in libraries, and to give form and expression to their needs. It has led to the formation of local clubs and associations, of which there now exist over twenty-five in the United States, with a total membership of more than 2000 persons. These, holding conferences at more frequent intervals than the A.L.A., have kept interest and enthusiasm active among smaller groups, and have been able to exert a potent influence in local library affairs. The publishing section of the A.L.A., among other undertakings, issues select lists for reading, and printed catalogue cards of current publications, and an index on cards of certain current scientific serials, compiled by five co-operating libraries. In general, effort among librarians is constant towards the economy both of specialization (as regards material) and co-operation (as regards service).

Library Schools.—Education for library work has been advanced by the establishment of schools giving instruction in library economy, and in some cases authorized to confer degrees (B.L.S.). The parent of these schools (now at Albany, N. Y.) was established in 1884. Others are now at Brooklyn, Philadelphia, the University of Illinois, and elsewhere. The admission requirements of two of them presuppose a college degree. The course covers a period varying from one to three years. The number of students graduating in a single year reaches perhaps twenty to each school.

Local Progress.—The multiplication and increasing elaboration of buildings for library uses is but suggestive of the general advance. The three largest cities in the United States no longer sniffer the reproach of being without adequate library facilities. Chicago, besides its municipal (public) library system, has two liberally endowed free reference libraries, the Newberry and the Crerar, which divide in part the field of literature, the Crerar confining itself to science and the technical arts. Philadelphia has now a free library system, the central building of which will cost at least a million dollars, and which meanwhile surpasses all records in the number of books issued to its readers. New York has had for some years a system of free libraries, enlarging by gift and appropriation, to the maintenance of which the city contributes, and which parallel in activity the system at Philadelphia. In 1895 there was brought about the notable consolidation of the Astor, Lenox, and Tilden foundations upon which the New York Public Library is to be based. This brought together two great reference collections, aggregating over 500,000 books, besides pamphlets, and endowments in buildings and funds aggregating more than \$8,000,000. The city assigned to it a superb site of ample dimensions, appropriated \$2,500,000 for the main building, and will doubtless contribute towards maintenance, at any rate upon the assumption by the library trustees of the work of the present free circulating libraries. The union of all these funds and forces will provide for New York City the most elaborate library system of any city in the world, the culmination to date of library progress in American municipalities.

Authorities.—FLETCHER, WILLIAM I. *Public Libraries in America*, 2nd edit., Boston, 1899. A convenient sketch and manual. The statistics are now compiled systematically by the Bureau of Education, and published in its special reports on the *Public Libraries of the United States and Canada*, of which the first in 1876 has been followed by others in 1886, 1891, and 1896. On library administration the papers contributed to the Library Conference at the Chicago Exposition, 1892, summarize the best experience of American librarians at that date. See also DANA, JOHN C. *A Library Primer*, Chicago, 1899.—PLUMMER, MARY W. *Hints to Small Libraries*, 2nd edit., New York, 1898.—But the entire subject, historical, statistical, and administrative, is most amply covered in the files of the *Library Journal* (New York, September 1876, to date and current), a monthly. This is the official organ of the American Library Association, and includes its proceedings. See also the file of *Public Libraries*, a monthly, published at Chicago 1896, to date and current.

LIST OF THE PRINCIPAL LIBRARIES IN THE UNITED STATES,

INCLUDING THE TWO LARGEST LIBRARIES OF EACH STATE, AND ALL OTHERS HAVING 50,000 VOLUMES AND UPWARDS.

The statistics are official, furnished in part by the libraries to date, in part taken from their latest accessible printed reports (1897–1901); for the other libraries, marked *, they are taken from "Public, Society, and School Libraries," Washington, 1901 (advance sheets from the *Annual Report of the United States Commissioner of Education, 1899–1900*). Under printed volumes are included pamphlets; when the number of the latter is large in proportion to the total it is noted under "Remarks." In that column libraries are also distinguished as T., supported by taxation; E., maintained by endowment or special funds; C., free circulating; R., reference only; C. and R., circulating and reference; F.R., free for reference; S., society or proprietary; Sub., subscription; special character is noted when not self-evident, e.g., Science. The list contains 224 libraries in all (including 67 libraries with 100,000 volumes and upwards). The reference "1897 report" or "1901 report" in the "Remarks" column is to the statistics of the Bureau of Education.

Library.	Founded.	Printed Vols.	Approximate Annual Accessions.	Approximate Annual Income.	Remarks.
Alabama—				\$

Licata, a seaport town of the province of Girgenti, Sicily, Italy, on the south coast, at the mouth of the river Salso, 24 miles south-east of Girgenti (54 miles by rail). The town, which stands below the level of the sea, is "a very miserable place to look at now, with its nooks and corners, its blind alleys and dark lanes, its dirty, ill-smelling, narrow, crooked streets" (Vice-consul Giglio in 1896). It has a Gothic church, a technical school, and the ruins of two ancient castles; one of these, San Angelo, was bought and repaired by the Italian Government in 1888, and equipped as a signalling tower. The people carry on live-stock breeding, the cultivation of fruits, flowers, and vegetables, cheese-making, sulphur mining and refining, the manufacture of pottery (porous jars) and macaroni, flour-milling, brick- and tile-making, and fish-curing, chiefly anchovies and sardines. Licata is one of the principal Sicilian ports for the exports of sulphur. In 1888 sulphur was exported to the value of £549,000; and £380,150 in 1898. The total exports were valued at £576,600 in 1888; £453,700 in 1899. The total imports fluctuate from £34,000 (1887) to £246,650 (1896); £125,600 in 1899. The port was cleared by an average of 933 vessels of 157,200 tons in the years 1893-99 inclusive. In 1896 the Government voted £66,730 for the improvement of the harbour (10-16 feet deep); and at the same time a concession was granted for the construction of an entirely new harbour, 2 miles from the old one, with every appliance of a first-class port. Population (1881), 17,478; (1899), 23,700.

Lichfield, a city, municipal borough, and county of itself in the Lichfield parliamentary division (since 1885) of Staffordshire, England, 118 miles north-west of London by rail. The restoration of the cathedral has been completed; the old church of St Chad at Stowe and that of St Michael have been restored. The house in which Dr Johnson was born has been acquired by the corporation through the generosity of Alderman Gilbert, and opened to the public in a similar manner to Shakespeare's birth-place at Stratford-on-Avon. Area, 3421 acres. Population (1881), 8349; (1891), 7864; (1901), 7902.

Liddell, Henry George (1811-1898), English scholar and divine, eldest son of the Rev. Henry George Liddell, younger brother of the first Baron Ravensworth, was born at Binchester, 6th February 1811, but his father becoming soon afterwards rector of Boldon, between Newcastle-on-Tyne and Sunderland, most of his childhood and boyhood was passed there. When eight years old he was sent to a private school near Ripon, from which he proceeded at the age of twelve to Charterhouse, and seven years later, May 1830, to Christ Church, Oxford. Gaining a double first in 1833, Liddell became a college tutor, and pursuing the study of divinity, was ordained in 1838. In the same year Dean Gaisford appointed him Greek reader in Christ Church, and in May 1846 he was appointed to the headmastership of Westminster School. Meanwhile his life work, the great *Lexicon* (based on the German work of Passow), which he and Robert Scott began as early as 1834, had made good progress, and after about ten years of hard work the first edition, which may more properly be termed the first draft, appeared in 1843. It immediately became the standard Greek-English dictionary and still maintains this rank, although, notwithstanding the great additions made of late to our Greek vocabulary from inscriptions, papyri, and other sources, scarcely any enlargement has been made since about 1880. It is nevertheless understood that Dean Liddell continued to labour upon it almost to the last day of his long life. As headmaster of Westminster Liddell enjoyed a period of great success, followed by trouble due to the outbreak

of fever and cholera in the school. When this was over he found time to write a *History of Ancient Rome*, and to take a very active part in the first Oxford University Commission. In 1855 he received the appointment of dean of Christ Church, with which his name will always be connected. His tall figure, fine presence, and aristocratic mien were for many years associated with all that was characteristic of Oxford life. Coming just at the transition period when the "old Christ Church," which Pusey strove so hard to preserve, was inevitably becoming broader and more liberal, it was chiefly due to Liddell that necessary changes were effected with the minimum of friction. With the buildings of Christ Church also his name will long be associated, especially with the much-needed restoration of the cathedral and the improvement of the services. In 1859 Dean Liddell welcomed the then prince of Wales when he matriculated at Christ Church, being the first holder of that title who had matriculated since Henry V. In conjunction with Sir Henry Acland, Dean Liddell did much to encourage the study of art at Oxford, and his taste and judgment gained him the admiration and friendship of Ruskin. In 1891, owing to advancing years, he resigned the deanery. The last years of his life were spent at Ascot, where he died 18th January 1898. Dean Liddell married in July 1846 Miss Lorina Reeve, by whom he had a numerous family.

Liddon, Henry Parry (1829-1890), English divine, was born at North Stoneham, Hampshire, on 20th August 1829. He was educated at King's College School, London, and at Christ Church, Oxford. He graduated, taking a second class, in 1850. In 1854 he was made vice-principal of the Theological College at Cuddesdon. His influence over the students was immense, and his sermons held some ten or twelve hearers as much enthralled as they afterwards did the vast congregations in St Paul's Cathedral. In 1859 he resigned the vice-principalship, in consequence of some divergence of opinion between him and Bishop Wilberforce. He returned to Oxford, and became a growing force there among the undergraduates, exercising his influence in strong opposition to the Liberal reaction against Tractarianism, which had set in after Newman's secession in 1845. In 1864 Bishop Hamilton of Salisbury, whose examining chaplain he had been, appointed him prebendary of Salisbury Cathedral. In 1866 he delivered his famous Bampton Lectures, in which, with a wide range of general knowledge, with remarkable clearness, brilliancy, and logical coherence, as well as with a considerable store of theological learning, he enforced and illustrated the doctrine of the Divinity of Christ. From that time his fame as a preacher, which had been steadily growing, may be considered to have been established. In 1870 he was made canon of St Paul's. He had before this published *Some Words for God*, in which, with great power and eloquence, he combated the scepticism of the day. His preaching at St Paul's soon attracted vast crowds. The afternoon sermon, which fell to the lot of the canon in residence, had usually been delivered in the choir of the Cathedral. But soon after Liddon's appointment it became necessary to preach the sermon under the dome, where as many as 4000 persons, it was estimated, used to gather to hear the preacher. Few orators belonging to the Church of England have acquired so great a reputation as Canon Liddon. Others may have surpassed him in originality, learning, or reasoning power. But for grasp of his subject, clearness of language, lucidity of arrangement, felicity of illustration, vividness of imagination, elegance of diction, and above all, for sympathy with the intellectual position of those whom he addressed, he has hardly a rival

among the celebrated preachers of the Anglican communion. In the elaborate arrangement of his matter he is thought to have imitated the great French preachers of the age of Louis XIV. In 1870 he was also made Ireland Professor of Exegesis at Oxford. These two appointments combined gave him extensive influence over the Church of England. Liddon at Oxford, and Liddon and Church at St Paul's, may be said to have restored the waning influence of the Tractarian school, and the former succeeded in popularizing the opinions which, in the hands of Pusey and Keble, had appealed to thinkers and scholars. Some clouds in connexion with the Pusey House at Oxford, where Liddon considered that a departure was being made from the line of thought laid down by Pusey himself, disturbed the repose of his later days. Illness seized him in 1889, and on 9th September 1890 he passed away at Weston-super-Mare, in the full vigour of his intellect and at the zenith of his reputation. He had undertaken an elaborate life of Dr Pusey, for whom his admiration was unbounded; and this work was completed after his death by other hands. Canon Liddon's character was as much a force as his eloquence. His strong advocacy of Church views, which were somewhat "advanced," raised up a host of opponents and critics. But there was none who could fail to entertain respect for his honesty, sincerity, and devotion, as well as for a combination of personal gifts only too rarely found in any branch of the Church.

(J. J. L*.)

Lie, Jonas Lauritz Edemil (1833—), Norwegian novelist, was born on 6th November 1833 close to Hougund (Eker), near Drammen. In 1838, his father being appointed sheriff of Tromsø, the family removed to that Arctic town. Here the future novelist enjoyed an untrammelled childhood among the shipping of the little Nordland capital, and gained acquaintance with the wild seafaring life which he was afterwards to describe. In 1846 he was sent to the naval school at Frederiksværn to become a cadet, but his extreme near-sight unfitted him for service, and he was transferred to the Latin school at Bergen. In 1851 he went up to the University of Christiania, where Ibsen and Björnson were among his fellow-students. Jonas Lie, however, showed at this time no inclination to literature. He pursued his studies as a lawyer, took his degrees in law in 1858, and settled down to practice as a solicitor in the little town of Kongsvinger. In 1860 he married his cousin, Thomasine Lie. In 1866 Lie published his first book, a volume of poems. Two years later, at the mature age of thirty-five, he abandoned the law, and came back to Christiania to try his luck as a man of letters. As a journalist he had no success, but in 1870 he published a melancholy little romance, *The Man with the Second Sight*, which enjoyed some favour with the public. Lie proceeded to Rome, and published *Tales* in 1871, and *The Three-master "The Future,"* a novel, in 1872. His first great book, however, was *The Pilot and his Wife* (1874), which placed Jonas Lie at the head of Norwegian novelists; it was written in the little town of Rocca di Papa in the Albano mountains. Lie spent the next few years partly in Dresden, partly in Stuttgart, with frequent summer excursions to Berchtesgaden in the Bavarian highlands. During his exile he produced the drama in verse called *Faustina Strozzi* (1876). Returning to Norway, Lie began a series of romances of modern life in Christiania, of which *Thomas Ross* (1878) and *Adam Schrader* (1879) were the earliest. He returned to Germany, and settled first in Dresden again, then in Hamburg, until 1882, when he took up his abode finally in Paris. The novels of his German period are *Rutland* (1881) and *Go Ahead!* (1882), tales of life in the Norwegian merchant navy. His later works, produced with great

regularity, have enjoyed an immense reputation in Norway. Two of the most successful of these have been *The Com-modore's Daughters* (1886) and *Niobe* (1894), both of which have been presented to English readers in the International Library, edited by Mr Gosse. One of the best of Lie's works is the romance called *When the Sun goes down* (1895). It has been said that "Jonas Lie stands, as a novelist, with those minute and unobtrusive painters of contemporary manners who defy arrangement in this or that school. He is with Mrs Gaskell or M. Ferdinand Fabre; he is not entirely without relation with that old-fashioned favourite of the public, Fredrika Bremer. His truthfulness, his simple pathos, his deep moral sincerity, have gradually conquered for him a place in the hearts of his countrymen and countrywomen which there is no one to dispute with him." He is by far the most popular of the living novelists of Norway. Among his later works must be mentioned the powerful novel of *Dyre Rein* (1896), the fairy drama of *Lindelín* (1897), *Faste For-land* (1899), a romance, and *When the Iron Curtain falls* (1902). Jonas Lie has resided for many years in Paris, spending every summer in his villa at Berchtesgaden in Tirol.

Lie, Marius Sophus (1842-1899), Norwegian mathematician, was born at Nordfjordeif, near Bergen, on 12th December 1842, and was educated at the University of Christiania, where he took his doctor's degree in 1868 and became extraordinary professor of mathematics four years later. In 1886 he was chosen to succeed Klein in the chair of geometry at Leipzig, but as his fame grew his countrymen began to feel that it was not right that one so distinguished should be obliged to work in a foreign land, and a special post was therefore arranged for him in Christiania. This, however, he did not live to enjoy very long, for his health was broken down by too assiduous study, and he died at Christiania on 12th February 1899, six months after his return. Lie's work exercised a great influence on the progress of mathematical science during the later decades of the 19th century. His primary aim has been declared to be the advancement and elaboration of the theory of differential equations, and it was with this end in view that he developed his theory of transformation groups, set forth in his *Theorie der Transformationsgruppen* (3 vols., Leipzig, 1888-93), a work of wide range and great originality, by which probably his name is best known. A special application of his theory of continuous groups was to the general problem of non-Euclidean geometry. The latter part of the book above mentioned was devoted to a study of the foundations of geometry, considered from the standpoint of Riemann and Helmholtz; and he intended to publish a systematic exposition of his geometrical investigations, in conjunction with Dr G. Scheffers, but only one volume made its appearance (*Geometrie der Berührungstransformationen*, Leipzig, 1896). The reader will find many references to Lie's work scattered through the mathematical articles in these volumes, e.g., DIFFERENTIAL EQUATIONS; GEOMETRY, LINE; GEOMETRY, NON-EUCLIDEAN; GROUPS, THEORY OF. Lie was a foreign member of the Royal Society, as well as an honorary member of the Cambridge Philosophical Society and the London Mathematical Society, and his geometrical inquiries gained him the much-coveted honour of the Lobatchewsky prize.

Lieben, a village and commune in the government district of Karolinenthal, Bohemia, north-east of Prague, and a station on the north-western and the Austro-Hungarian state railways. It immediately adjoins the Karolinenthal suburb, and is a busy industrial centre

with numerous textile and other factories, manufacturing among other things chemicals, colours, oil, pipes, gloves, leather, machinery, bricks, tiles, and beer. Population (1890) of the village, 9000, and of its commune, 12,536; (1900), 21,300, almost exclusively Czech and Catholic.

Liebkecht, Wilhelm (1826–1900), German Socialist, was born in Giessen, on 29th March 1826, of a respectable middle-class family. Left an orphan at an early age, he was educated at the gymnasium in his native town, and attended the universities of Giessen, Berlin, and Marburg. Before he left school he had become affected by the political discontent then so universal in Germany; he had already studied the writings of St Simon, from which he gained his first interest in Communism, and had been converted to the extreme Republican theories of which Giessen had long been a centre. He soon came into conflict with the established authorities—no difficult matter in those days—and was expelled from Berlin apparently in consequence of the strong sympathy he displayed for the Poles, who were being tried for high treason. Like so many of his countrymen, he proposed in 1846 to migrate to America, but went instead to Switzerland, where he earned his living as a teacher in the Froebel Institute. As soon as the Revolution of 1848 broke out he hastened to Paris, but the attempt to organize a Republican corps for the invasion of Germany was prevented by the Government. In September, however, in concert with Struve, he crossed the Rhine from Switzerland at the head of a band of volunteers, and proclaimed a Republic in Baden. The attempt collapsed; he was captured, and after suffering eight months' imprisonment, was brought to trial. Fortunately for him, a new rising had just broken out; the mob burst into the court, and he was acquitted. During the short duration of the Revolutionary Government he was an active member of the most extreme party, but on the arrival of the Prussian troops succeeded in escaping to France. Thence he went to Geneva, where he came into intercourse with Mazzini; but, unlike most of the German exiles, he was already an adherent of the Socialist creed, which at that time was more strongly held in France. Expelled from Switzerland, he went to London, where he lived for thirteen years in close association with Karl Marx. Like most of the other exiles, he endured great hardships, but secured a livelihood by teaching and writing; he was a correspondent of the *Augsburger Allgemeine Zeitung*. During his imprisonment in Freiburg he had won the affections of the gaoler's daughter, and in 1856 she came to London, where they were married. The amnesty of 1861 opened for him the way back to Germany, and in 1862 he accepted the post of editor of the *Norddeutsche Allgemeine Zeitung*, the founder of which was an old revolutionist. Only a few months elapsed before the paper passed under Bismarck's influence. There is no more curious episode in German history than the success with which Bismarck acquired the services of many of the men of 1848. Liebkecht remained faithful to his principles, and resigned his editorship. He became a member of the Arbeiterverein, and after Lassalle's death was the chief mouthpiece in Germany of Karl Marx, and was instrumental in spreading the influence of the newly-founded *International*. Expelled from Prussia in 1865, he settled at Leipzig, and it is primarily to his activity in Saxony among the newly-formed unions of workers that the modern Social Democrat party owes its origin. He was in 1867 elected member of the North German Reichstag, but in opposition to Lassalle's followers refused all compromise with the "capitalists," and avowedly used his position merely for purposes of agitation and to take every opportunity for making the Parliament ridicu-

lous. He was strongly influenced by the "great German" traditions of the Democrats of 1848, and, violently anti-Prussian, he distinguished himself by his attacks on the policy of 1866 and the "Revolution from above," and by his opposition to every form of militarism. The traditions of 1848 are also seen in his dread of Russia, which he maintained to his death. His opposition to the war of 1870 (he and Bebel alone refused to vote for the war loan) exposed him to insults and violence, and in 1872, with Bebel, he was condemned to two years' imprisonment in a fortress for treasonable intentions. The union of the German Socialists in 1874 at the Congress of Gotha was really a triumph of his influence, and from that time he was regarded as founder and leader of the party. He was till his death a member at the German Reichstag, and for many years also of the Saxon Parliament. In all debates he was one of the chief spokesmen of the party, and he took a very important part in directing their policy. In 1881 he was expelled from Leipzig, but took up his residence in a neighbouring village. After the lapse of the Socialist law (1890) he became chief editor of the *Vorwärts*, and settled in Berlin. In November 1895 he was condemned to four months' imprisonment for *lèse majesté*. If he did not always find it easy in his later years to follow the new developments, he preserved to his death the idealism of his youth, the hatred both of Liberalism and of State Socialism; and though he was to some extent overshadowed by Bebel's greater oratorical power, he was the chief support of the orthodox Marxian tradition. Liebkecht was the author of numerous pamphlets and books, of which the most important were—*Soll Europa Kosakisch werden? Robert Blum und seine Zeit, Geschichte der Französischen Revolution, Die Emser Depesche, and Robert Owen*. He died in Berlin on 6th August 1900.

Liechtenstein, the smallest independent state in Europe, save San Marino and Monaco, extending along the right bank of the Rhine, opposite Swiss territory between Sargans and Sennwald, while to the east it also comprises the upper portion of the Samina glen which debouches into the Ill valley at Frastanz, below Feldkirch. It is 12 miles in length, and has an area of 68·8 square miles. Its loftiest point rises on the crest of the Rhatikon range at the south-east angle of the state, and is called the Naafkopf or Rothe Wand (8426 or 8445 feet); on its summit the Swiss, Vorarlberg, and Liechtenstein frontiers join. Population (1886), 9593; (1896), 9600. Compulsory military service was abolished in 1868, and the state now contains more men than women. The capital is Vaduz (1523 feet), which has 1100 inhabitants. Till the 17th century the Romonsch language was not extinguished in the state, and many Romonsch place-names still linger, e.g., Vaduz, Samina, Gavadura, &c. The constitution of 1862 was amended in 1878 and 1895. All males of twenty-four years are primary electors, but the twelve elected members of the Diet (holding their seats for four years) are elected indirectly through a second set of electors. The prince has a lieutenant at Vaduz, whence there is an appeal to the prince's court at Vienna, with (since 1884) a final appeal to the supreme court at Innsbruck. The principality is joined with Vorarlberg from the customs point of view, and with Austria as regards postal and coinage arrangements. The principality is ecclesiastically in the diocese of Coire. It has now no public debt, while in 1899 the receipts amounted to 281,548 florins and the expenses to 281,375 florins. According to the agreement of 1852, by which Liechtenstein made a customs union with Austria, Austria must yearly pay it at least 20,000 florins.

(W. A. B. C.)

Liège (Flemish, *Luik*), a province of Belgium, bordering on Dutch Limburg, Rhenish Prussia, and the Belgian provinces of Luxembourg, Namur, Brabant, and Limbourg. The province is of very varied character, ranging in altitude from 300 to over 2000 feet, and distributed in part into four quite distinct regions—the highly agricultural Hesbaye, the pastoral Herve, the calcareous Condroz, and the schistose, uneven and picturesque Ardenne. The principal rivers are the Meuse and its affluent the Ourthe. A canal runs laterally by the Meuse from Liège to Maastricht. The mineral productions are important: coal worked at seventy different places and occupying 30,000 workers; zinc and lead ores (250 workers); iron ores (200 workers); building and paving-stone quarries at 240 places, and employing more than 5000 workers. The agricultural products are oats, wheat, potatoes, rye, beetroot. Woods cover 18 per cent. of the area. Agriculture and mining are the two special industries of the province. The metal industry is carried on in every branch: smelting, making of iron, steel, sheet-iron, rails, steam-engines, armoury, &c., employing altogether 40,000 workers, principally in the arrondissement of Liège; the other industries include wool-spinning and the making of woollen stuffs and cloths carried on in the arrondissement of Verviers, and employing 15,000 workers. The making of crystal is also an industry of important dimensions, employing 4400 workers in the arrondissement of Liège. The province is divided into four administrative arrondissements, whose capitals are Liège (173,706 inhabitants); Huy (14,644 inhabitants); Verviers (52,203); Waremme (4000). Among other noteworthy places are Seraing (39,623 inhabitants), near Liège, famous for its vast metallurgic establishment founded in 1817 by John Cockerell, and the pretty town of Spa (8192 inhabitants), well known for its mineral waters. The province of Liège has an area of 1117 square miles, with a population of 851,485, or 762.3 to the square mile. The administrative arrondissement of Liège has the greatest density of population, namely, nearly 1700 inhabitants per square mile. In 1875 the population of the province numbered 645,000, and the increase since that date has been 30 per cent.

Liège, a city in the province of Liège, the seat of a bishopric, at the confluence of the Ourthe with the Meuse, 50° 38' 48" N. and 5° 34' 30" E. Since 1860 great works have been carried out, which, regulating the course of the river, prevent as far as possible the inundations formerly frequent, and have brought about a complete transformation of the city. Along its whole course through the city the Meuse is bordered by quays. Its banks are connected by six bridges. A canal of very slight fall (*canal de dérivation*), bordered with quays, receives the waters of the Ourthe and conducts them into the Meuse below the city, forming in so doing a long island on the right bank. A magnificent quarter has been laid out on the left bank, on the site of an old dock. Higher instruction is largely represented by a state university (with 1500 students), to which are annexed special institutes of botany, zoology, anatomy, physiology, pharmacy, and chemistry, an electro-technical institute, a school of mines, a school of arts and manufactures, and a rich library. At Liège there are also a Conservatoire de Musique and an observatory. Industry is brisk and

flourishing. The characteristic branches are coal-mining (employing 5000 workers), the working of which has had to be stopped in the galleries penetrating under the city and the river, and the manufacture of small arms, more than a million pieces being tried annually on the testing-bench, employing more than 3000 workers in the city, a great number of them working at home. Other industries are the smelting of metals, the making of mechanical works, tools, electrical machines, and railway material. Liège is, moreover, the centre of a considerable number of important industrial localities. Its lines of communication are the Meuse and the canal from Liège to Maastricht, and the railways running to Namur, to Brussels, to Hasselt and Limbourg, to Maastricht and Holland, to Aix-la-Chapelle and Germany, and to Luxembourg. Population (1875), 117,600; (1900), 173,706, an increase in twenty-five years of 47.7 per cent.

Liegnitz, a town of Prussia, province of Silesia, 40 miles west of Breslau by rail. The Lutheran church of St Peter and St Paul was restored in 1892-94. The town has monuments to Frederick the Great (1869), Emperor William I. (1898), and the war of 1870-71; also an agricultural school and a deaf and dumb institute. The growing of vegetables, especially small cucumbers (*gurken*) and onions, is a speciality; other industries are the making of machinery, pianos, sewing-machines, cloth, wool, and artistic turnery. Population (1885), 43,347; (1900), 54,839.

Lien.—The word *lien* is literally the French for a band, cord, or chain, and keeping in mind that meaning we see in what respect it differs from a pledge on the one hand and a mortgage on the other. It is the bond which attaches a creditor's right to a debtor's property, but which gives no right *ad rem*, *i.e.*, to property in the thing; if the property is in the possession of the creditor he may retain it, but in the absence of statute he cannot sell to recover what is due to him without the ordinary legal process against the debtor; and if it is not in possession, the law would indeed assist him to seize the property, and will hold it for him, and enable him to sell it in due course and pay himself out of the proceeds, but does not give him the property itself. It is difficult to say at what period the term *lien* made its appearance in English law; it probably came from more than one source. In fact, it was used as a convenient phrase for any right against the owner of property in regard to the property not specially defined by other better recognized species of title.

The possessory *lien* of a tradesman for work done on the thing, of a carrier for his hire, and of an innkeeper for his bill, would seem to be an inherent right which must have been in existence from the dawn, or before the dawn, of civilization. Probably the man who made or repaired weapons in the Stone Age was careful not to deliver them until he received what was stipulated for, but it is also probable that the term itself resulted from the infusion of the civil law of Rome into the common law of England which the Norman Conquest brought about, and that it represents the "tacit pledge" of the civil law. As might be expected, so far as the possessory *lien* is concerned, the common law and civil law, and probably the laws of all countries, whether civilized or not, coincide; but there are many differences with respect to other species of *lien*. For instance, by the common law—in this respect a legacy of the feudal system—a landlord has a *lien* over his tenant's furniture and effects for rent due, which can be enforced without the assistance of the law simply by the landlord taking possession, personally or by his agent, and selling

enough to satisfy his claim ; whereas the maritime lien is more distinctly the product of the civil law, and is only found and used in Admiralty proceedings, the High Court of Admiralty having been founded upon the civil law, and still (except so far as restrained by the common law courts prior to the amalgamation and co-ordination of the various courts by the Judicature Acts, and as affected by statute law) acting upon it. The peculiar effects of this maritime lien are discussed below. There is also a class of liens, usually called equitable liens (*e.g.*, that of an unpaid vendor of real property over the property sold), which are akin to the nature of the civil law rather than of the common law. The word lien does not frequently occur in statute law, but it is found in the extension of the common law "carriers' or shipowners' lien" in the Merchant Shipping Act, 1894 ; in the definition, extension, and limitation of the vendor's lien ; in the Factors Act, 1877, and the Sale of Goods Act, 1893 ; in granting a maritime lien to a shipmaster for his wages and disbursements, and in regulating that of the seamen in the Merchant Shipping Act, 1894 ; and in the Equity jurisdiction of the County Courts, 1888.

Common-Law Liens.—These may be either particular, *i.e.*, a right over one or more specified articles for a particular debt, or general, *i.e.*, for all debts owing to the creditor by the debtor.

The requisites for a particular lien are, firstly, that the creditor should be in possession of the article ; secondly, that the debt should be incurred with reference to the article ; and thirdly, that the amount of the debt should be certain. It may be created by express contract, by implied contract (such as the usage of a particular trade or business), or as a consequence of the legal relation existing between the parties. As an example of the first, a shipowner at common law has a lien on the cargo for the freight ; but though the shipper agrees to pay dead freight in addition, *i.e.*, to pay freight on any space in the ship which he fails to occupy with his cargo, the shipowner has no lien on the cargo for such dead freight except by express agreement. The most usual form of the second is that which is termed a possessory lien—the right a ship-repairer has to retain a ship in his yard till he is paid for the repairs executed upon her,¹ and the right a cobbler has to retain a pair of shoes till he is paid for the repairs done to them. But this lien is only in respect of the work done on, and consequent benefit received by, the subject of the lien. Hence an agistor of cattle has no lien at common law upon them for the value of the pasturage consumed, though he may have one by agreement ; nor a conveyancer upon deeds which he has not drawn, but which are in his possession for reference. The most common example of the third is that of a carrier, who is bound by law to carry for all persons, and has therefore a lien for the price of the carriage on the goods carried. So much favoured is this lien that it has been held that even if the goods are stolen, and entrusted to the carrier by the thief, the carrier can hold them for the price of the carriage against the rightful owner. Of the same nature is the common-law lien of an innkeeper on the baggage of his customer for the amount of his account, he being under a legal obligation to entertain travellers generally. Another instance of the same class is where a person has obtained possession of certain things over which he claims to hold a lien in the exercise of a legal right. For example, when a lord of a manor has seized cattle as estrays, he has a lien upon them for the expense of their keep as against the real owner ; but,

as before pointed out, the holder's claim must be specific, otherwise a general tender of compensation releases the lien.

A general lien is a right of a creditor to retain property, not merely for charges relating to it specifically, but for debts due on a general account. This not being a common-law right, is viewed by the English courts with the greatest jealousy, and to be enforced must be strictly proved. This can be done by proof either of an express or implied contract or of a general usage of trade. The first of these is established by the ordinary methods or by previous dealings between the parties on such terms ; the second is recognized in certain businesses, and it would probably be exceedingly difficult, if not impossible, to extend it at the present time to any other trades. When, however, a lien by general usage has once been judicially established, it becomes part of the Law Merchant, and the courts are bound to recognize and enforce it. The best known and most important instance is the right of a solicitor to retain papers in his hands belonging to his client until his account is settled. The solicitor's lien, though probably more commonly enforced than any other, is of no great antiquity in English law, the earliest reported case of it being in the reign of James II. ; but it is now of a twofold nature. In the first place there is the retaining lien. This is similar in kind to other possessory liens, but of a general nature attaching to all papers of the client, and even to his money, up to the amount of the solicitor's bill, in the hands of the solicitor in the ordinary course of business. There are certain exceptions which seem to have crept in for the same reason as the solicitor's lien itself, *i.e.*, general convenience of litigation ; such exceptions are the will of the client after his decease, and proceedings in bankruptcy. In this latter case the actual possessory lien is given up, the solicitor's interests and priorities being protected by the courts, and it may be said that the giving up the papers is really only a means of enforcing the lien they give in the bankruptcy proceedings. In the second place there is what is called a charging lien—more correctly classed under the head of equitable lien, since it does not require possession, but is a lien the solicitor holds over property recovered or preserved for his client. He had the lien on an order by the court upon a fund in court by the common law, but as to property generally it was only given by 23 and 24 Vict. c. 127, § 28 ; and it has been held to attach to property recovered in a probate action (*ex parte Tweed*, C. A. 1899, 2 Q.B. 167). A banker's lien is the right of a banker to retain securities belonging to his customer for money due on a general balance. Other general liens, which have been judicially established, are those of wharfingers, brokers, and factors (which are in their nature akin to those of solicitors and bankers), and of calico printers, packers of goods, fullers (at all events at Exeter), dyers, and millers ; but in all these special trades it is probable that the true reason is that the account due was for one continuous transaction. The calico would come to be printed, the goods to be packed, the cloth to be bleached, the silk to be dyed, and the corn to be ground, in separate parcels, it is true, and at different times, but all as one undertaking ; and they are therefore, though spoken of as instances of general lien, only adaptations by the courts of the doctrine of particular lien to special peculiarities of business. In none of these cases would the lien exist, in the absence of special agreement, for other matters of account, such as money lent or goods sold.

Equitable Liens.—"Where equity has jurisdiction to enforce rights and obligations growing out of an executory contract," *e.g.*, in a suit for specific performance, "this

¹ This right, however, is not absolute, but depends on the custom of the port (*Raitt v. Mitchell*, 4 Camp. 146).

equitable theory of remedies cannot be carried out unless the notion is admitted that the contract creates some right or interest in or over specific property, which the decree of the court can lay hold of, and by means of which the equitable relief can be made efficient. The doctrine of equitable liens supplies this necessary element; and it was introduced for the sole purpose of furnishing a ground for these specific remedies which equity confers, operating upon particular identified property instead of the general pecuniary recoveries granted by courts of common law. It follows therefore that in a large class of executory contracts express and implied, which the common law regards as creating no property, right, nor interest analogous to property, but only a mere personal right to obligation, equity recognizes in addition to the personal obligation a particular right over the thing with which the contract deals, which it calls a *lien*, and which though not property is analogous to property, and by means of which the plaintiff is enabled to follow the identical thing and to enforce the defendant's obligation by a remedy which operates directly on the thing. The theory of equitable liens has its ultimate foundation, therefore, in contracts express or implied which either deal with or in some manner relate to specific property, such as a tract of land, particular chattels or securities, a certain fund, and the like. It is necessary to divest oneself of the purely legal notion concerning the effects of such contracts, and to recognize the fact that equity regards them as creating a charge upon, or hypothecation of, the specific thing, by means of which the personal obligation arising from the agreement may be more effectively enforced than by a mere pecuniary recovery at law" (Pomeroy, 2 Eq. Jur. 232). This description from an American text-book seems to give at once the fullest and most concise definition and description of an equitable lien. It will be seen that it differs essentially from a common-law lien, inasmuch as in the latter possession or occupation is as a rule necessary for its existence, whereas in the equitable lien the person claiming the lien is seldom in possession or occupation of the property, its object being to obtain the possession wholly or partially. A special instance of such a lien is that claimed by a publisher over the copyright of a book which he has agreed to publish on terms which are not complied with—for example, the author attempting to get the book published elsewhere. It cannot perhaps be said that this has been absolutely decided to exist, but a strong opinion of the English Court of Exchequer towards the close of the 18th century was expressed in its favour (*Brook v. Wentworth*, 3 Anstruther 881). Other instances are the charging lien of a solicitor, already referred to, and the lien of a person on improvements effected by him on the property of another who "lies by" and allows the work to be done before claiming the property. So also of a trustee for expenses lawfully incurred about the trust property. The power of a limited liability company to create a lien upon its own shares was in 1901 established (*Allen v. Gold Reefs, &c.*, C.A. [1901] 1 Ch. 656).

Maritime Liens.—Maritime lien differs from all the others yet considered, in its more elastic nature. Where a maritime lien has once attached to property—and it may and generally does attach without possession—it will continue to attach, unless lost by laches, so long as the thing to which it attaches exists, notwithstanding changes in the possession of and property in the thing, and notwithstanding that the new possessor or owner may be entirely ignorant of its existence; and even if enforced it leaves the owner's personal liability for any balance unrealized intact (the *Gemma*, 1899, P. 285). So far as England is concerned, it must be borne in mind that the Courts of Admiralty were conducted in accordance with

the principles of civil law, and in that law both the pledge with possession and the hypothecation without possession were well recognized. The extreme convenience of such a right as the latter with regard to such essentially movable chattels as ships is apparent. Strictly speaking, a maritime lien is confined to cases arising in those matters over which the Courts of Admiralty had original jurisdiction, viz., collisions at sea, seamen's wages, salvage, and bottomry, in all of which cases the appropriate remedy is a proceeding *in rem* in the Admiralty Court. In the first of these—collisions at sea—if there were no maritime lien there would frequently be no remedy at all. When two ships have collided at sea it may well be that the innocent ship knows neither the name nor the nationality of the wrongdoer, and the vessel may escape with slight damage and not have to make a port of refuge in the neighbourhood. Months afterwards it is ascertained that she was a foreign ship, and in the interval she has changed owners. Then, were it not a fact that a maritime lien invisible to the wrongdoer nevertheless attaches itself to his ship at the moment of collision, and continues to attach, the unfortunate owner of the innocent ship would have no remedy, except the doubtful one of pursuing the former owner of the wrong-doing vessel in his own country in a personal action where such proceedings are allowed—which is by no means the case in all foreign countries. The same reasons apply, though not possibly with quite the same force, to the other classes of cases mentioned.

Between 1840 and 1873 the jurisdiction of the Admiralty Court was largely extended. At the latter date it ceased to exist as a separate court, and was merged in the Probate, Divorce, and Admiralty division of the High Court of Justice. Since the merger questions have arisen as to how far the enlargement of jurisdiction has extended the principle of maritime lien. An interesting article on this subject by J. Mansfield, barrister-at-law, will be found in the *Law Quarterly Review*, vol. iv., October 1888. It must be sufficient to state here that where legislation has extended the already existing jurisdiction to which a maritime lien pertained, the maritime lien is extended to the subject matter, but that where a new jurisdiction is given, or where a jurisdiction formerly existing without a maritime lien is extended, no maritime lien is given, though even then the extended jurisdiction can be enforced by proceedings *in rem*. Of the first class of extended jurisdictions are collisions, salvage, and seamen's wages. Prior to 1840 the Court of Admiralty only had jurisdiction over these when occurring or earned on the high seas. The jurisdiction, and with it the maritime lien, is extended to places within the body of a county in collision or salvage; and as to seamen's wages, whereas they were dependent on the earning of freight, they are now free from any such limitation; and also, whereas the remedy *in rem* was limited to seamen's wages not earned under a special contract, it is now extended to all seamen's wages, and also to a master's wages and disbursements, and the maritime lien covers all these. The new jurisdiction given over claims for damage to cargo carried into any port in England or Wales, and on appeal from the county courts over all claims for damage to cargo under £300, though it may be prosecuted by proceedings *in rem*, i.e., by arrest of the ship, yet confers no maritime lien; and so also in the case of claims by material men (builders and fitters-out of ships) and for necessaries. Even though in the latter case the Admiralty Court had jurisdiction previously to 1840 where the necessaries were supplied on the high seas, yet as it could not be shown that such jurisdiction had ever been held to confer a maritime lien, no such lien is given. Even now there is much doubt as to whether towage confers a maritime lien or not, the

services rendered being pursuant to contract, and frequently to a contract made verbally or in writing on the high seas, and being rendered also to a great extent on the high seas. In these cases and to that extent the High Court of Admiralty would have had original jurisdiction. But prior to 1840 towage, as now rendered by steam tugs expressly employed for the service, was practically unknown, and therefore there was no established catena of precedent to show the exercise of a maritime lien. It may be argued on the one hand that towage is only a modified form of salvage, and therefore entitled to a maritime lien, and on the other that it is only a form of necessary power supplied like a new sail or mast to a ship to enable her to complete her voyage expeditiously, and therefore of the nature of necessities, and as such not entitled to a maritime lien. The matter is not of academical interest only, for though in the case of an inward-bound ship the tug owner can make use of his statutory right of proceeding *in rem*, and so obtain much of the benefit of a maritime lien, yet in the case of an outward-bound ship, if she once gets away without payment, and the agent or other authorized person refuses or is unable to pay, the tug owner's claim may very likely, on the return of the ship to a British port, be met by an allegation of a change of ownership, which defeats his right of proceeding at all if he has no maritime lien; whereas if he has a maritime lien he can still proceed against the ship and recover his claim, if he has not been guilty of laches.

A convenient division of the special liens other than possessory on ships may be made by classifying them as maritime, statutory-maritime or quasi-maritime, and statutory. The first attach only in the case of damage done by collision between ships on the high seas, salvage on the high seas, bottomry, and seamen's wages so far as freight has been earned; the second attach in cases of damage by collision within the body of a county, salvage within the body of a county, life salvage everywhere, seamen's wages even if no freight has been earned, master's wages and disbursements. These two classes continue to attach notwithstanding a change of ownership without notice of the lien, if there have been no laches in enforcing it (the *Bold Buccleuch*, 7 Moo. P.C. 267; the *Kong Magnus*, 1891, P. 233). The third class, which only give a right to proceed *in rem*, *i.e.*, against the ship itself, attach, so long as there is no *bonâ fide* change of ownership, without citing the owners, in all cases of claims for damage to ship and of claims for damage to cargo where no owner is domiciled in England or Wales. Irrespective of this limitation, they attach in all cases not only of damage to cargo, but also of breaches of contract to carry where the damage does not exceed £300, when the suit must be commenced in a county court having Admiralty jurisdiction; and in cases of claims for necessities supplied elsewhere than in the ship's home port, for wages earned even under a special contract by masters and mariners, and of claims for towage. As already observed, it is still doubtful whether the lien for towage is not, in some cases at all events, within the former classes. In all three classes the lien also exists over cargo where the suit from its nature extends to it, as in salvage and in some cases of bottomry or respondentia, and in cases where proceedings are taken against cargo by the shipowner for a breach of contract (cargo *ex Argos* and the *Hewsons*, L.R., 5 P.C. 134; the *Alina*, 5 Ex. Div. 227).

Elsewhere than in England, and those countries such as the United States which have adopted her jurisprudence in maritime matters generally, the doctrine of maritime lien, or that which is substituted for it, is very differently treated. Speaking generally, those states

which have adopted the Napoleonic codes or modifications of them—France, Italy, Spain, Holland, Portugal, Belgium, Greece, Turkey, and to some extent Russia—have instead of a maritime lien the civil-law principle of privileged debts. Amongst these in all cases are found claims for salvage, wages, bottomry under certain restrictions, and necessities. Each of these has a privileged claim against the ship, and in some cases against freight and cargo as well, but it is a matter of very great importance that, except in Belgium, a claim for collision damage (which as we have seen confers a maritime lien, and one of a very high order, in Great Britain) confers no privilege against the wrong-doing ship, whilst in all these countries an owner can get rid of his personal liability by abandoning the ship and freight to his creditor, and so, if the ship is sunk, escape all liability whilst retaining any insurance there may be. This, indeed, was at one time the law of Great Britain; the measure of damage was limited by the value of the *res*; and in the United States at the present time a shipowner can get rid of his liability for damage by abandoning the ship and freight. A different rule prevails in Germany and the Scandinavian states. There claims relating to the ship, unless the owner has specially rendered himself liable, confer no personal claim at all against him. The claim is limited *ab initio* to ship and freight, except in the case of seamen's wages, which do confer a personal claim so far as they have been earned on a voyage or passage completed prior to the loss of the ship. In all maritime states, however, except Spain, a provisional arrest of the ship is allowed, and thus between the privilege accorded to the debt and the power to arrest till bail is given or the ship abandoned to creditors, a condition of things analogous to the maritime lien is established; especially as these claims when the proper legal steps have been taken to render them valid—usually by endorsement on the ship's papers on board, or by registration at her port of registry—attach to the ship and follow her into the hands of a purchaser. They are in fact notice to him of the incumbrance.

Duration of Lien.—So long as the party claiming the lien at common law retains the property, the lien continues, notwithstanding the debt in respect of which it is claimed becoming barred by the Statute of Limitations (*Higgins v. Scott*, 2 B. and Ald. 413). But if he takes proceedings at law to recover the debt, and on a sale of the goods to satisfy the judgment purchases them himself, he so alters the nature of the possession that he loses his lien (*Jacobs v. Lawton*, 5 Bing. 130). An equitable lien probably in all cases continues, provided the purchaser of the subject matter has notice of the lien at the time of his purchase. A maritime lien is in no respect subject to the Statute of Limitations, and continues in force notwithstanding a change in the ownership of the property without notice, and is only terminated when it has once attached, by laches on the part of the person claiming it (the *Kong Magnus*, 1891, P. 223). There is an exception in the case of seamen's wages, where by 4 Anne c. 16 (*Stat. Rev.* 4 and 5 Anne c. 3) all suits for seamen's wages in the Admiralty must be brought within six years.

Ranking of Maritime Liens.—It is clear from what has been said that at times there may be several claimants holding maritime and other liens on the same vessel. For example, a foreign vessel comes into collision by her own fault and is damaged and her cargo also; she is assisted into port by salvors and ultimately under a towage agreement, and put into the hands of a shipwright who does necessary repairs. The innocent party to the collision has a maritime lien for his damage, and the seamen for their wages; the cargo owner has a suit *in rem* or a statutory lien for damage, and the shipwright a possessory lien for

the value of his repairs, while the tugs certainly have a right *in rem* and possibly a maritime lien also in the nature of salvage. It is highly probable that the value of the property will be insufficient to pay all, and it becomes a matter of great consequence to settle whether any, and if so which, have priority over the others, or whether all rank alike and have to divide the proceeds of the property *pro rata* amongst them. The following general rules apply: liens for benefits conferred rank against the fund in the inverse, and those for the reparation of damage sustained in the direct order of their attaching to the *res*; as between the two classes those last mentioned rank before those first mentioned of earlier date; as between liens of the same class and the same date, the first claimant has priority over others who have not taken action. The Courts of Admiralty, however, allow equitable considerations, and enter into the question of marshalling assets. For example, if one claimant has a lien on two funds, or an effective right of action in addition to his lien, and another claimant has only a lien upon one fund, the first claimant will be obliged to exhaust his second remedy before coming into competition with the second. As regards possessory liens, the shipwright takes the ship as she stands, *i.e.*, with her incumbrances, and it appears that the lien for seamen's wages takes precedence of a solicitor's lien for costs, under a charging order made in pursuance of 23 and 24 Vict. c. 127, § 28. Subject to equitable considerations, the true principle appears to be that services rendered under an actual or implied contract, which confer a maritime lien, make the holder of the lien in some sort a proprietor of the vessel, and therefore liable for damage done by her—hence the priority of the damage lien—but, directly it has attached, benefits conferred on the property by enabling it to reach port in safety benefit the holder of the damage lien in common with all other prior holders of maritime liens. It is less easy to see why of two damage liens the earlier should take precedence of the later, except on the principle that the *res* which came into collision the second time is depreciated in value by the amount of the existing lien upon her for the first collision, and where there was more than one damage lien, and also liens for benefits conferred prior to the first collision between the two collisions and subsequent to the second, the court would have to make a special order to meet the peculiar circumstances, which happily do not often occur. The claim of a mortgagee naturally is deferred to all maritime liens, whether they are for benefits conferred on the property in which he is interested or for damage done by it, and also for the same reason to the possessory lien of the shipwright, but both the possessory lien of the shipwright and the claim of the mortgagee take precedence over a claim for necessities, which, as we have seen, only confers a statutory lien or a right to proceed *in rem* in certain cases. In other maritime states possessing codes of commercial law, the privileged debts are all set out in order of priority in these codes, though, as has been already pointed out, the lien for damage by collision—the most important in English law—has no counterpart in most of the foreign codes.

Stoppage in Transitu.—This is a lien held by an unpaid vendor in certain cases over goods sold after they have passed out of his actual possession. It has been much discussed whether it is an equitable or common-law right or lien. The fact appears to be that it has always been a part of the Law Merchant, which, properly speaking, is itself a part of the common law of England unless inconsistent with it. This particular right was, in the first instance, held by a court of equity to be equitable and not contrary to English law, and by that decision this particular part of the Law Merchant was approved and

became part of the common law of England (see per Lord Abinger in *Gibson v. Carruthers*, 8 M. and W., p. 336 *et seq.*). It may be described as a lien by the Law Merchant, decided by equity to be part of the common law, but in its nature partaking rather of the character of an equitable lien than one at common law. "It is a right which arises solely upon the insolvency of the buyer, and is based on the plain reason of justice and equity that one man's goods shall not be applied to the payment of another man's debts. If therefore, after the vendor has delivered the goods out of his own possession and put them in the hands of a carrier for delivery to the buyer, he discovers that the buyer is insolvent, he may re-take the goods if he can before they reach the buyer's possession, and thus avoid having his property applied to paying debts due by the buyer to other people" (*Benjamin on Sales*, 2nd edition, 289). This right, though only recognized by English law in 1690, is highly favoured by the courts on account of its intrinsic justice, and extends to quasi-vendors, or persons in the same position, such as consignors who have bought on behalf of a principal and forwarded the goods, and other similar cases. It is, however, defeated by a lawful transfer of the document of title to the goods by the vendor to a third person, who takes it *bona fide* and for valuable consideration (Factors Act, 1889; Sale of Goods Act, 1893).

Assignment or Transfer of Lien.—A lien being a personal right acquired in respect of personal services, it cannot, as a rule, be assigned or transferred; but here again there are exceptions. The personal representative of the holder of a possessory lien on his decease would probably in all cases be held entitled to it; and it has been held that the lien over a client's papers remains with the firm of solicitors notwithstanding changes in the constitution of the firm (*Gregory v. Cresswell*, 14 L.J. Ch. 300). So also where a solicitor, having a lien on documents for his costs, assigned the debt to his bankers with the benefit of the lien, it was held that the bankers might enforce such lien in equity. But though a tradesman has a lien on the property of his customer for his charges for work done upon it, where the property is delivered to him by a servant acting within the scope of his employment, such lien cannot be transferred to the servant, even if he has paid the money himself; and the lien does not exist at all if the servant was acting without authority in delivering the goods, except where (as in the case of a common carrier) he is bound to receive the goods, in which case he retains his lien for the carriage against the rightful owner. On the other hand, where there is a lien on property of any sort not in possession, a person acquiring the property with knowledge of the lien takes it subject to such lien. This applies to equitable liens, and cannot from the nature of the case apply to those common-law liens in which possession is necessary. It is, however, true that by statute certain common-law liens can be transferred, *e.g.*, under the Merchant Shipping Act a master of a ship having a lien upon cargo for his freight can transfer the possession of the cargo to a wharfinger, and with it the lien (Merchant Shipping Act, 1894, § 494). In this case, however, though the matter is simplified by the statute, if the wharfinger was constituted the agent or servant of the shipmaster, his possession would be the possession of the shipmaster, and there would be no real transfer of the lien; therefore the common-law doctrine is not altered, only greater facilities for the furtherance of trade are given by the statute, enabling the wharfinger to act in his own name without reference to his principal, who may be at the other side of the world. So also a lien may be retained, notwithstanding that the property passes out of possession, where it has to be deposited in some special place (such as the Custom-

House) to comply with the law. Seamen cannot sell or assign or in any way part with their maritime lien for wages (Merchant Shipping Act, 1894, § 156), but nevertheless, with the sanction of the Court, a person who pays seamen their wages is entitled to stand in their place and exercise their rights (the *Cornelia Henrietta*, L.R. 1 A. and E. 51).

Waiver.—Any parting with the possession of goods is in general a waiver of the lien upon them; for example, when a factor having a lien on the goods of his principal gives them to a carrier to be carried at the expense of his principal, even if undisclosed, he waives his lien, and has no right to stop the goods *in transitu* to recover it; so also where a coach-builder who has a lien on a carriage for repairs allows the owner from time to time to take it out for use without expressly reserving his lien, he has waived it, nor has he a lien for the standage of the carriage except by express agreement, as mere standage does not give a possessory lien. It has even been held that where a portion of goods sold as a whole for a lump sum has been taken away and paid for proportionately, the conversion has taken place and the lien for the residue of the unpaid purchase-money has gone (*Gurr v. Cuthbert*, 12 L.J. Ex. 309). Again, an acceptance of security for a debt payable at a future date is inconsistent with the existence of a lien, as it substitutes the credit of the owner for the material guarantee of the thing itself, and so acts as a waiver of the lien. For the same reason even an agreement to take security is a waiver of the lien, though the security is not, in fact, given (*Alliance Bank v. Broom*, 11 L.T. 332).

Sale of Goods under Lien.—At common law the lien, as already pointed out, only gives a right to retain the goods, and ultimately to sell by legal process, against the owner; but in certain cases a right has been given by statute to sell without the intervention of legal process, such as the right of an innkeeper to sell the goods of his customer for his unpaid account (Innkeepers Act, 1878, § 1), the right of a wharfinger to sell goods entrusted to him by a shipowner with a lien upon them for freight, and also for their own charges (Merchant Shipping Act, 1894, §§ 497, 498), and of a railway company to sell goods for their charges (Railway Clauses Act, 1845, § 97). Property affected by an equitable lien or a maritime lien cannot be sold by the holder of the lien without the interposition of the Court to enforce an order, or judgment of the Court. In Admiralty cases, where a sale is necessary, no bail having been given and the property being under arrest, the sale is usually made by the marshal in London, but may be elsewhere on application of the parties concerned showing that a better price is likely to be obtained.

AMERICAN LAW.—In the United States, speaking very generally, the law relating to liens is that of England, but there are some considerable differences occasioned by three principal causes. (1) Some of the Southern states, notably Louisiana, have never adopted the common law of England as their own. When that state became one of the United States of North America it had (and still preserves) its own system of law. In this respect the law is practically identical with the Code Napoleon, which, again speaking generally, substitutes privileges for liens, *i.e.*, gives certain claims a prior right to others against particular property. These privileges being *strictissime interpretations*, cannot be extended by any principle analogous to the English doctrine of equitable liens. (2) Probably in consequence of the United States and the several states composing it having had a more democratic government than Great Britain, until at all events recent years, certain liens have been created by statute in several states in the interest of the working classes

which have no parallel in Great Britain: *e.g.*, in some states workmen employed in building a house or a ship have a lien upon the building or structure itself for their unpaid wages. This statutory lien partakes rather of the nature of an equitable than of a common-law lien, as the property is not in the possession of the workman, and it may be doubted whether the right thus conferred is more beneficial to the workman than the priority his wages have in bankruptcy proceedings in England. Some of the states have also practically extended the maritime lien to matters over which it was never contended for in England. (3) By the constitution of the United States the Admiralty and inter-state jurisdiction is vested in the Federal as distinguished from the state courts, and these Federal courts have not been liable to have their jurisdiction curtailed by prohibition from courts of common law, as the Court of Admiralty had in England up to the time of the Judicature Acts; consequently the maritime lien in the United States extends farther than it does in England, even after recent enlargements; that is to say, it covers claims for necessities and by material men (see *Maritime Lien*), as well as collision, salvage, wages, bottomry, and damage to cargo.

Difficulties connected with lien occasionally arise in the Federal courts in Admiralty cases, from a conflict on the subject between the municipal law of the state where the court happens to sit and the admiralty law; but as there is no power to prohibit the Federal court, its view of the admiralty law based on the civil law prevails. More serious difficulties arise where a Federal court has to try inter-state questions, where the two states have different laws on the subject of lien; one for example, like Louisiana, following the civil law, and the other the common law and equitable practice of Great Britain. The question as to which law is to govern in such a case can hardly be said to be decided. "The question whether equitable liens can exist to be enforced in Louisiana by the Federal courts, notwithstanding its restrictive law of privileges, is still an open one" (Derris, *Contracts of Pledge*, 517; and see *Burdon Sugar Refining Co. v. Payne*, 167 U.S. 127).

BRITISH COLONIES.—In those colonies which before the Canadian federation were known as Upper Canada and the Maritime Provinces of British North America, and in the several Australasian states where the English common law is enforced except as modified by colonial statute, the principles of lien, whether by common law or equitable or maritime, discussed above with reference to England, will prevail; but questions not dissimilar to those treated of in reference to the United States may arise where colonies have come to the Crown of Great Britain by cession, and where different systems of municipal law are enforced. For example, in Lower Canada the law of France prior to the Revolution occupies the place of the common law in England, but is generally regulated by a code very similar to the Code Napoleon; in Mauritius and its dependencies the Code Napoleon itself is in force except so far as modified by subsequent ordinances. In the South African colonies, and to some extent in Ceylon and Guiana, Roman-Dutch law is in force; in the island of Trinidad old Spanish law, prior to the introduction of the present civil code of Spain, is the basis of jurisprudence. Therefore it is by no means safe to assume that the English law of lien is in force in all British colonies. Each several system of law requires to be studied on the point; but, speaking generally, apart from the possessory lien of workmen and the maritime lien of the vice-admiralty courts, it may be assumed that the rules of the civil law, giving a privilege or priority in certain specified cases rather than a lien as understood in English law, prevail in those colonies where the English law is not in force. (F. W. RA.)

Lierre, or **LIER**, a town of Belgium, in the province and 10 miles south-east of Antwerp by rail. Among its numerous industries are the manufacture of boots and shoes, brushes, and cutlery. Population (1880), 17,133; (1890), 20,133; (1900), 22,654.

Liestal, the capital (since 1833) of the half canton Basel-Stadt. It is 9½ miles by rail from Basel, and 15½ miles from Olten. It is a well-built but uninteresting little town, the largest in the canton after Basel. In the Rathhaus is the drinking-cup of Charles the Bold of Burgundy, taken at the battle of Nancy in 1477. Population (1888), 4850; (1900), 5488.

Liévin. See **LENS**.

Life-Boat.—A very marked advance in the direction of improvement in design and suitability for practical service has been made in the life-boat since 1882, such development dating in some degree from the reorganization of the Royal National Life-boat Institution of Great Britain in 1883, but principally from the beginning of 1887, when, as the result of a serious accident in December 1886 to two self-righting life-boats in Lancashire, twenty-seven out of twenty-nine of the men who manned them were lost in their efforts to render assistance to a vessel in distress. At this time a permanent technical sub-committee was appointed by the Institution, whose object was, with the assistance of an eminent consulting naval architect—a new post created—and the Institution's official experts, to give its careful attention to the designing of improvements in the life-boat and its equipment, and to the scientific consideration of any inventions or proposals submitted by the public, with a view to adopting them if of practical utility. Whereas, therefore, in 1881 the self-righting life-boat of that time was looked upon as the Institution's special life-boat, and there were only a very few of the 271 life-boats in the Institution's fleet which were not of that type, at the close of 1901 the 288 life-boats of the Institution stationed on the coast of the United Kingdom included only 228 boats of the self-righting type, the remaining 60 all being non-self-righting boats of various types, known by the following designations:—Steam life-boats 4, Cromer 3, Lamb and White 1, Liverpool 14, Norfolk and Suffolk 19, tubular 1, Watson 18. Of the 271 life-boats on the coast at the end of 1881, only 12 remained at the close of 1901, 259 having been replaced by boats of the latest types, provided with the newest improvements in equipment and gear. The self-righting life-boat of 1901 was a very different boat from that of 1881. The Institution's present policy is to allow the men who man the life-boats, after having seen and tried by deputation the various types, to select that in which they have the most confidence. In 1901 a steam-tug was placed at Padstow for use solely in conjunction with the life-boats on the north coast of Cornwall.

The present life-boat of the self-righting type (Fig. 1) differs materially, as already stated, from its predecessor, the stability being increased and the righting power greatly improved. The test of efficiency in this last quality was formerly considered sufficient if the boat would quickly right herself in smooth water without her crew and gear, but every self-righting life-boat now built by the Institution will right with her full crew and gear on board, with her sails set, and the anchor down. Most of the larger self-righting boats are furnished with "centre-boards" or "drop-keels" of varying size and weight, which can be used at pleasure, and materially add to their weather qualities. The drop-keel was for the first time placed in a life-boat in 1885.

Steam was first introduced into a life-boat in 1890, when

the Royal National Life-boat Institution, after very full inquiry and consideration, stationed on the coast a steel life-boat, 50 feet long and 12 feet beam, and a depth of 3 feet 6 inches, propelled by a turbine wheel driven by

Fig. 1.—Plans, profile, and section of self-righting life-boat. A, deck; B, relieving valves for automatic discharge of water off deck; C, side air-cases above deck; D, end air compartments, usually called "end-boxes," an important factor in self-righting; E, wale, or fender; F, iron keel ballast, important in general stability and self-righting; G, water-ballast tanks; H, drop-keel.

engines developing 170 horse-power. It had been previously held by all competent judges that a mechanically-propelled life-boat, suitable for service in heavy weather, was a problem surrounded by so many and great difficulties that even the most sanguine experts dared not hope for an early solution of it. This type of boat (Fig. 2)

Fig. 2.—Plans, profile, and section of steam life-boat. A, cockpit; a, deck; b, propeller hatch; c, relief valves; B, engine-room; C, boiler-room; D, water-tight compartments; E, coal-bunkers; F, capstan; G, hatches to engine- and boiler-rooms; H, cable reel; I, anchor davit.

has proved very useful, and been the means of saving many lives. It is, however, on all hands fully recognized that boats of this description can necessarily be used at only a very limited number of stations, and where there is a harbour which never dries out. The Institution has since built five other steam life-boats, the latest of which was completed in April 1901, the last three being fitted with a protected screw-propeller. It had been hoped that

electrical propulsion and oil fuel might have been used in the steam life-boats, but the experiment with the latter, which had a fair trial in the earlier boats built, was not very successful, and it was not repeated in the later boats. The idea of employing electricity was, after the most careful consideration, regretfully abandoned. The highest speed attained by the first hydraulic steam life-boat was rather more than 9 knots, and that secured in the latest 9½ knots.

The other types of pulling and sailing life-boats are all non-self-righting, and are specially suitable for the requirements of the different parts of the coast on which they are placed. Their various qualities will be understood by a glance at the illustrations (Figs. 3, 4, 5, 6, and 7).

The Institution continues to build life-boats of different sizes according to the requirements of the various points of the coast at which they are placed, but of late years the tendency has been generally to increase the dimensions of the boats as the smaller ones become worn out or obsolete.

Fig. 3.—Plans, profile, and section of Cromer type of life-boat. A, deck; B, relieving valves for automatic discharge of water off deck; C, side air-cases above deck; E, wale, or fender; G, water-ballast tanks.

This change of policy is mainly due to the great transformation which has taken place in the shipping of all the trading nations, the small coasters and fishing-boats having in great measure disappeared, their places being taken by steamers and steam trawlers. The cost of the building and equipping of pulling and sailing life-boats has materially increased, more especially since 1898, the increase being mainly due to improvements and the seriously augmented charges for materials and labour. In 1881 the average cost of a fully-equipped life-boat and carriage was £650, whereas at the end of 1901 it amounted to £1000, the average annual cost of maintaining a station having risen to more than £100.

The transporting-carriage continues to be a most important part of the equipment of life-boats, generally of the self-righting type, and is absolutely indispensable where it is necessary to convey the boats for the purpose of launching to any point not in the immediate vicinity of the boat-house. It is not, however, usual to supply carriages to boats of larger dimensions than 37 feet in length by 9 feet beam, those in excess as regards length and beam being either launched by means of special slipways or kept afloat. The transporting-carriage of to-day is, however, an improvement on that used in 1881, and has been rendered particularly useful at places

where the beach is soft, sandy, or shingly, by the introduction in 1888 of Tipping's sand-plates. These very efficient adjuncts to easy and prompt launching are composed of an endless plateway or jointed wheel tyre fitted to the main wheels of the carriage, thereby enabling the boat to be transferred with rapidity and with greatly decreased labour over beach and soft sand. Further efficiency in launching has also been attained at many stations

Fig. 4.—Plans, profile, and section of Liverpool type of life-boat. A, B, C, E, G, as in Fig. 3; D, end air-compartments; F, iron keel; H, drop-keels.

by the introduction in 1890 of pushing-poles, attached to the transporting-carriages, and of horse launching-poles, first used in 1892. Fig. 8 gives a view of the modern transporting-carriage fitted with Tipping's sand- or wheel-plates.

The life-belt has since 1898 been considerably improved, being now less cumbersome than formerly, and

Fig. 5.—Plans, profile, and section of Norfolk and Suffolk type of life-boat. A, B, E, F, G, H, as in Fig. 4; A, side deck; I, cable-well.

more comfortable. The feature of the principal improvement is the reduction in length of the corks under the arms of the wearer and the rounding-off of the upper portions, the result being that considerably more freedom is provided for the arms. The maximum extra buoyancy has thereby been reduced from 25 lb to 22 lb, which is more than sufficient to support a man heavily clothed with his head and shoulders above the water, or to enable him to support another person besides

himself. Numerous life-belts of very varied descriptions, and made of all sorts of materials, have been patented, but it is generally agreed that for life-boat work the cork life-belt of the Royal National Life-boat Institution has not yet been equalled.

Life-saving rafts, seats for ships' decks, dresses, buoys, belts, &c., have been produced of late years in all shapes and sizes, but nothing apparently has as yet been brought out which has been generally acknowledged to be indispensable. Those interested in life-saving appliances were hopeful that the great International Exhibition held at Paris in 1900 would have produced some life-saving invention which might prove a benefit to the civilized world, but so lacking in real merit were the life-saving exhibits that the jury of experts were unable, after three months' careful examination and consideration, to award to any of the 435 competitors the Andrew Pollok prize of £4000 for the best method or device for saving life from shipwreck.

History.—Since 1881 the necessity and importance of

Fig. 6.—Plan, profile, and section of Tubular type of life-boat. A, deck; E, wale, or fender; H, drop-keel.

the existence of a thoroughly efficient life-boat service have been more generally felt and acknowledged by the people not only of Great Britain, but also of those other countries on the European Continent which have a sea-board, and of the British colonies—the countries which possessed such life-saving services having since greatly improved and enlarged their scope where necessary, while those which were not so provided have established life-boat services. All the foreign life-boat institutions and services have been founded more or less on the lines of the Royal National Life-boat Institution, which is regarded by them in the light of a foster-mother. The British Institution has greatly developed since its reorganization in 1883, both in its life-saving efficiency and financially, and has been spoken of in the highest terms as regards its management by successive Governments—a Select Committee of the House of Commons in 1897 reporting to the House that the thanks of the whole community were due to the Institution for its energy and good management. At the close of 1901 the Institution's fleet consisted of 288 life-boats, and the total number of lives for the saving of which the committee of management had granted rewards since the establishment of the Institution in 1824 was 43,197. At this time there were only fifteen life-boats of any sort on the coast of the United Kingdom which did not belong to the Institution. In 1882 the total amount of

money received by the Institution from all sources was £57,797, 11s. 9d., whereas in 1901 the total amount received had more than doubled, having increased to £107,293, 6s. 11d.; this latter sum was on three occasions considerably exceeded, namely, in 1894, 1896, and 1898.

In 1882 the Institution undertook, with the view of diminishing the loss of life annually occurring among the coast fishermen, to provide the masters and owners of fishing-vessels with trustworthy aneroid barometers, at about a third of the retail price, and in 1883 the privilege was extended to the masters and owners of coasters under 100 tons burden. This action was highly appreciated, and at the end of 1901 as many as 4417 of these valuable instruments had been supplied. In 1889 the committee of management promoted a Bill in the House of Commons to provide for the removal of wrecks in non-navigable waters which might prove dangerous to life-boat crews and others. This Bill, under the title Removal of Wrecks Act, 1877, Amendment Act, 1889, became law on the 31st May 1889, and under its useful provisions numerous highly

Fig. 7.—Plans, profile, and section of Watson type of life-boat. Lettering as in Fig. 4, but C, side air-cases above deck and thwarts.

dangerous wrecks have been removed. This Act was the first signed in 1889 by Queen Victoria, who, from 1837 until her death in January 1901, was the patron of the Institution, being then succeeded by King Edward VII., who as prince of Wales had been the president of the Institution for several years.

In 1893, at the instance of the committee of management, the chairman of the Institution moved a resolution in the House of Commons that, in order to decrease the serious loss of life from shipwreck on the coast, the British Government should provide either telephonic or telegraphic communication between all the coast-guard stations and signal stations on the coast of the United Kingdom; and that on those parts of the coast where there are no coast-guard stations the post offices nearest to the life-boat stations should be electrically connected, the object being to give the earliest possible information to the life-boat authorities at all times, by day and night, when the life-boats are required for service; and further, that a Royal Commission should be appointed to consider the desirability of electrically connecting the rock lighthouses, light-ships, &c., with the shore. The resolution was agreed to without a division, and since then its intention has been practically carried out, the results obtained having proved most valuable and useful in the saving of life.

On the 1st of January 1898 a pension and gratuity

scheme was introduced by the committee of management, under which life-boat coxswains, bowmen, and signalmen of long and meritorious service, retiring on account of old age, accident, ill-health, or abolition of office, receive special allowances as a reward for their good services. The adoption of this course gave the greatest satisfaction to the life-boat men all round the coast; and while these payments act as an incentive and inducement to the men to do their utmost to discharge their duties satisfactorily, they at the same time assist the committee of management in their effort to obtain the best men for the work. For many years the Institution has given compensation to any who may have received injury while employed in the service, besides granting liberal help to the widows and dependent relatives of any in the service who lose their own lives when endeavouring to rescue others.

FIG. 8.—Life-boat transporting-carriage with Tipping's wheel-plates.

The *rocket apparatus*, which is under the management of the coast-guard, continues to render excellent service in life-saving. No alteration or improvement of any moment has of late years been made in the apparatus. During the year ended the 30th June 1901, 152 lives were thus saved, this number being 154 less than the average for the previous ten years. The total number of lives saved by the life-saving apparatus between 1870 and 1901 was 7762. On the 30th June 1901 there were 217 life-saving companies, numbering in all 3770 volunteers, and there were six brigades with a total membership of 429.

The *United States* life-saving service, established in 1871, continues to be one of the chief life-saving services of the world. At the close of the fiscal year 30th June 1899 its establishment embraced 265 stations. Of this number 193 were situated on the Atlantic and Gulf coasts, 56 on the coasts of the Great Lakes, 15 on the Pacific coast, and one at the falls of the Ohio, Louisville, Kentucky. Comparatively few of the stations are open all the year round as in Great Britain, local requirements apparently rendering it necessary for the great majority of the stations to be "active" only for periods ranging from

two to ten months. The number of disasters to documented vessels within the field of station operations during the year was 428, and there were on board these vessels 3903 persons, of whom only 56 were lost. The estimated value of the vessels was \$6,072,635, and that of their cargoes \$2,032,005, making the total value of the property imperilled \$8,104,640. Of this amount \$6,261,900 was saved and \$1,842,740 lost. In addition to these there were 294 casualties to undocumented craft—sailing boats, rowing boats, &c.—carrying 671 persons, seven of whom perished. The value of the property involved in these instances was estimated at \$138,535, of which \$129,285 was saved and \$9250 lost; 751 persons received assistance at the stations, the number of days' relief afforded aggregating 1460; 63 lives were lost within the scope of the service during the year—a larger number, with a single exception, than in any year during the previous two decades. There were during the year 97 persons rescued from positions of danger otherwise than from vessels, who would in all probability have perished but for the aid of the surfmen. There were 591 stranded vessels floated off, repaired when damaged, piloted out of dangerous positions, and in similar ways assisted by the station crews. Minor assistance was also afforded to 382 vessels and small craft. 193 vessels running into danger of stranding were warned off by the signals of the patrol-men, most of them having been thus saved from either serious danger or total loss. The surf-boat was used 773 times, making 1089 trips. The self-righting and self-bailing life-boat was used 132 times, making 163 trips. The gasoline launches (at City Point station) were used 80 times, making 90 trips. Smaller boats were used 432 times, making 526 trips. The river life-skiffs (at the Louisville station) were used 41 times, making 97 trips. The breeches buoy was used 11 times, making 55 trips. The wreck gun was employed 17 times, firing 29 shots, and the heavy stick was used 28 times. There were 949 persons landed by the surf-boat, 111 by the life-boat, 184 by the gasoline launches, 162 by the river skiffs, 151 by other station boats, and 55 by the breeches buoy. In addition to these, 11 persons were rescued by men wading out into the surf, 6 by a ladder from shore to a stranded vessel, 6 by a line from a sinking vessel to a pier, 2 by means of heaving lines, and 1 person was hauled through the surf on the whip-line when the hawser was not set up. The total cost of maintaining the United States life-saving service during the year ended 30th June 1899 was \$1,549,411.

Life-boat Service in other Countries.—Good life-saving work continues to be done by the other life-boat services in Europe and elsewhere, most of these institutions having been formed on the lines of the Royal National Life-boat Institution of Great Britain. The services are operating in the following countries:—

Belgium.—Established in 1838. Supported entirely by Government.

Denmark.—Established in 1848. Government service.

Sweden.—Established in 1856. Government service.

France.—Established in 1865. Voluntary association, but assisted by the Government.

Germany.—Established in 1885. Supported entirely by voluntary contributions.

Turkey (Black Sea).—Established in 1868. Supported by dues.

Russia.—Established in 1872. Voluntary association, but receiving an annual grant from the Government.

Italy.—Established in 1879. Voluntary association.

Spain.—Established in 1880. Voluntary association, but receiving annually a grant of £1440 from Government.

Canada.—Established in 1880. Government service.

Holland.—Established in 1884. Voluntary association, but assisted by a Government subsidy.

Norway.—Established in 1891. Voluntary association, but receiving a small annual grant from Government.

Portugal.—Established in 1898. Voluntary society.

India (East Coast).—Voluntary association.

Australia (South).—Voluntary association.

New Zealand.—Voluntary association.

Japan.—The National Life-boat Institution of Japan was founded in 1889. It is a voluntary society, but is assisted by Government. Its affairs are successfully managed and worked by a president and a vice-president, supported by a very influential council. The head office is at Tôkyô, and numerous branches with local committees have been established. In June 1900 there were 17 rescue stations in full working order. The Imperial Government contributes an annual subsidy of 20,000 *yen* (£2000) and also renders every possible assistance. The following are the statistics of the lives and vessels saved during the years 1894 to 1898 inclusive:—

	Vessels saved.	Lives saved.
1894 . .	33	196
1895 . .	17	62
1896 . .	22	95
1897 . .	60	272
1898 . .	208	980

The council of the Institution are very sanguine that in the course of a few years they may, with the assistance of the Government, be able to establish as many as 113 rescue stations;

and these will, they think, be sufficient for the purposes of the objects of the Institution on the coast of Japan. The members of the Institution consist of three classes—honorary, ordinary, and sub-ordinary, the amount contributed by the member determining the class in which he is placed. Any member guilty of conduct detrimental to the credit of the Institution, or of delaying to pay his annual subscription, is deprived of his membership at the discretion of the council. The chairman and council are not, as in Great Britain, appointed by the subscribers, but by the president, who must always be a member of the imperial family. The institution bestows three medals:— (a) the medal of merit, to be awarded to persons rendering distinguished service to the Institution; (b) the medal of membership, to be held by honorary and ordinary members or subscribers; and (c) the medal of praise, which is bestowed on those distinguishing themselves for special service in the work of rescue. (C. DI.)

Ligao, a town near the centre of the province of Alabay, Luzon, Philippine Islands. The rich volcanic soil in its vicinity produces rice, hemp, Indian corn, fine sugarcane, and indigo, agriculture being the sole occupation of its inhabitants. The language is Bicol. Population, 17,000.

L I G H T.

THE view that light is physically a disturbance propagated through a subtle medium called the æther is now universally accepted. There are, no doubt, difficulties in realizing mentally the essential characteristics of this æther, but these are of a much less serious nature than those which beset any other supposition as to the mode of propagation of light. The simplicity and directness with which the accepted theory explains the ordinary laws of reflection, refraction, polarization, and interference phenomena have been fully illustrated in the articles LIGHT (*Ency. Brit.* vol. xiv.) and WAVE THEORY (*Id.* vol. xxiv.). In the great majority of cases of ordinary experience the mere conception of light as a wave motion through the æther supplies a sufficient explanation, and that without any regard to the essential character of the æther or to the nature of its connexion with matter. It is sufficient to assume that the disturbances in the æther are in some sense *transverse* to the direction in which the light is being propagated, and that matter tends to increase the effective density of the æther in the region where it is present. When, however, we pass to the consideration of the various phenomena that may be grouped under the head of "Dispersion," we are forced to inquire more particularly into the manner in which the particles of matter imbedded in the æther react upon the vibratory motion that is being propagated through it. This inquiry leads almost immediately to the more fundamental questions, What is the constitution of the æther, and what is the mode of connexion between æther and matter? In striving after an answer to these questions scientific men have indulged in a great deal of curious speculation, and it is important in discussing the advances made in our knowledge of the laws and nature of light to bear in mind the speculative character of much of our modern theory. Apart altogether from theoretic considerations, however, new facts are being added daily to our stores of knowledge, together with a fresh and deeper acquaintance with old ones, and it may be safely said that no recent result of experiment has been out of harmony with the broad theoretic view that light is physically an undulatory disturbance in a medium. Curious and complicated phenomena have, it is true, been brought to light, but these have not materially increased the difficulties of the theorist, whose hold of the fundamental principles has of late been greatly strengthened. It is the purpose of the present supplementary article to show how experiment and theory have aided each other

in deepening our knowledge of this important branch of physical science. (See ÆTHER.)

Photometry.—The great development of artificial lighting during the later years of the 19th century has given photometry an increased importance. For example, electric lights are classified according to their "candle-power." The candle, in terms of whose brightness the brightness of other sources of light is to be expressed, must, of course, fulfil the conditions demanded of all standards. It must give under definite and easily realizable conditions a definite and constant luminous effect, and it must be easily reproducible. The earlier attempts to get a candle of constant brightness were not very satisfactory. The British standard is a sperm candle which weighs $\frac{1}{16}$ lb and loses in burning 120 grains per hour. It is found that these conditions are not sufficient to determine the luminous power of the candle, since the length and shape of the wick, the height of the flame, and the composition, temperature, and humidity of the atmosphere all have an effect upon its brightness. The same is true of other similar sources of light—for example, the German standard candle, which is made of paraffin, has a diameter of 2 cm., and has its wick cut until the flame is 5 cm. high, but which with all precautions suffers continual alterations in brightness. For ordinary practical purposes, however, these candles are steady enough. Other kinds of flame have also been used as a standard source of light. The oldest of these is the French Carcel lamp, which is provided with a cylindrical Argand burner, and gives the standard brightness when 42 grammes of colza oil are consumed per hour. The supply and draught are regulated by clockwork. Vernon Harcourt's Pentane standard, in which a mixture of gaseous pentane and air is burned so as to maintain a flame 2.5 inches high at ordinary barometric pressure, gives good results, and is readily adjustable to suit varied conditions. For accurate scientific purposes the best standard is the Hefner-Alteneck or amyl-acetate lamp. It is of simple construction, and gives the standard brightness when it burns in still air with a flame 4 cm. in height. The brightness is affected by change of humidity, but careful measurements show that it may be trusted to within 2 per cent.

Violle has proposed to use as standard the light emitted by a square centimetre of surface of platinum at its melting-point, but there are obvious practical difficulties in the way of realizing this suggested standard. Petavel,

Standards of light.

who carefully examined the necessary conditions for producing it (*Proc. Roy. Soc.*, 1899), finds that the platinum must be chemically pure, that the crucible must be made of pure lime, that the fusion must be by means of the oxy-hydrogen blow-pipe, that the gases must be thoroughly mixed in the proportion of 4 volumes of hydrogen to 3 of oxygen, and that the hydrogen must contain no hydrocarbons. Under these conditions the variation in the light emitted by the molten platinum would probably not exceed 1 per cent. Lummer and Kurlbaum have proposed as a standard a strip of platinum foil 25 mm. wide and .015 mm. thick brought to incandescence by an electric current of about 80 amperes. The temperature is gradually increased until $\frac{1}{10}$ th of the total radiation is transmitted through a water trough 2 cm. in width. This ratio is determined by means of a bolometer, and so long as it is adjusted to $\frac{1}{10}$ th the light is practically constant. For comparative photometric work the incandescent electric light is very convenient, having the one great advantage over candles and flames that it is not affected by atmospheric changes. So far, however, it has not been found possible to make to specification a glow-light of definite candle-power when a given current is passed through it. A standard glow-lamp is yet to be devised.

The illuminating powers of two sources of light are most simply compared by so adjusting their distances from a given point as to have at this point equal illumination from the two sources. In addition to the methods associated with the names of Ritchie, Rumford, Bunsen, and Wheatstone (*Ency. Brit.* vol. xiv. pp. 583-84), there are several other methods, either new in principle or important modifications of those mentioned, which have come greatly into use, or which have special advantages for particular kinds of work.

Swan's prism photometer invented in 1859 is a beautiful application of the same principle that is embodied in Bunsen's grease-spot photometer (see *Trans. Roy. Soc. Ed.* vol. xxi.). The instrument is essentially the same as that described by Lummer and Brodhun in 1889, and generally named after them. It consists of two equal rectangular

Fig. 1.

glass prisms placed with their diagonal faces together so as to form a cube (Fig. 1), and cemented together by a small patch of Canada balsam, which spreads out into a circle when the prisms are pressed together. In Fig. 1, which represents a central section of the bi-prism, the Canada balsam is represented by the letter N. The light from two illuminated surfaces, PQ, RS, is allowed to fall perpendicularly on the faces AB, AD. In each case that

part of the light falling internally on the portion of the diagonal face which is not backed with the Canada balsam is totally reflected. On the other hand, the light which falls on the portion backed by the Canada balsam is almost wholly transmitted. Thus an eye placed in the position *qtp* receives light from both sources, the surface RS supplying nearly all the light that seems to come from the patch N, and the surface PQ supplying all the light which seems to come from the region immediately surrounding N. The patch N will in general be visible; but it will quite disappear when the luminosity of the ray *Tt*, which traverses the Canada balsam, is exactly equal to the

luminosity of the rays *Pp*, *Qq*, which have come after total reflection from the surface PQ. This condition of invisibility of N is arrived at by adjusting the positions of the sources of light which illuminate the surfaces PQ, RS. The brightnesses of the two sources will then be as the squares of their distances from their respective screens.

The essential part of Lummer and Brodhun's photometer is a combination of prisms very similar to Swan's. In its most improved form the bi-prism or "optical cube" has one of its component prisms cut in a peculiar manner. The diagonal face is partly cut away, so that the central part only of this face can be brought into contact with the diagonal face of the other prism. The Canada balsam may be dispensed with if the surfaces are pressed closely together so that no layer of air is left between them. In order to make the instrument convenient for use with an optical bench, Lummer and Brodhun make the illuminated surfaces which are to be compared the opposite sides of an opaque screen set in the continuation of the diagonal (CA) of the bi-prism, the rays being brought by reflection from symmetrically situated mirrors so as to enter the sides AB and AD perpendicularly. An important modification, due also to Lummer and Brodhun, is the following: By means of a sand-blast a portion, which may be called *r*, is removed from one half of the diagonal face of the one prism, and from the other half of the same prism there is removed in like manner all but a part *l* corresponding to the part *r*. The portions which have not been removed are pressed close to the diagonal face of the other prism, and become the parts through which light is freely transmitted. On the other hand, the light which enters the second prism and falls on the portions of surface backed by the layers of air filling the cut-out parts is totally reflected. The general result is the production of two similar luminous patches *l* and *r*, each of which is surrounded by a field of the same intensity as the other patch. When the photometric match is made the whole region will be uniformly bright. But, by insertion of strips of glass so as to weaken equally the intensity in the surrounding fields, the match will be obtained when these fields are made of equal intensity and when at the same time the two patches differ equally in intensity from them. Under these conditions the eye is able to judge more certainly as to the equality of intensity of the two patches, and an untrained observer is able to effect a comparison with an accuracy which is impossible with most forms of photometer.

Joly's diffusion photometer consists of two equal rectangular parallelepipeds of a translucent substance like paraffin separated by a thin opaque disc. It is set between the sources of light to be compared in such a way that each paraffin block is illuminated by one only of the sources, and is adjusted until the two blocks appear to be of the same brightness. The method is made more sensitive by mounting the photometer on an elastic vibrator so as to render it capable of a slight to-and-fro oscillation about a mean position.

When the sources of light differ in brightness, it is often convenient to cut down the intensity of the stronger by the interposition of an absorbing medium of neutral tint. A wedge of glass capable of a *Reducing intensity.* to-and-fro adjustment across the path of the rays is a favourite device, or a set of translucent plates of glass, the absorbing powers of which have been carefully determined. If light of intensity *I* is reduced by passage through such a plate to *I'*, the fraction transmitted by the plate is the ratio *I'/I*. Since every successive layer of given thickness through which the light passes reduces the intensity of the light incident upon it in a given ratio, it follows that the intensity of the light is

diminished in a geometrical progression as the distance travelled through increases in an arithmetical progression; in other words, the rate at which the intensity falls off per unit distance is proportional to the intensity, a law which is mathematically expressed by means of the exponential function. Thus after traversing thickness x the intensity I is reduced to $I' = Ie^{-ax}$ where e is the number 2.71828 . . . and a is known as the extinction-coefficient. Another method of cutting down the intensity of a ray in a given ratio is to make the beam intermittent by interposition of a rotating disc of which a sector has been removed. This was the method used by Swan in 1849 in his investigations on the "Gradual Production of Luminous Impressions on the Eye" (*Trans. R. S. E.* vol. xvi.), and it has been employed with various modifications by many other experimenters. The properties of plane polarized light may also with great advantage be used to effect the same purpose. Let the brighter beam be polarized by passage through an appropriate crystal, and then let a second polarizer be interposed. For certain positions of this polarizer nearly all the light will pass, and for certain other positions the light will be wholly cut off. Between these limits any intermediate intensity of light may be obtained by simply rotating the polarizer into a particular position. If I is the maximum intensity of light which can pass, the intensity of the light transmitted when the polarizer is turned through an angle ϕ is $I \cos^2 \phi$.

So long as the lights to be compared are of the same or nearly the same tint, the photometric match obtained by different observers is practically the same, but if they are of distinctly different colours, not only do different observers obtain different results, but those obtained by the same observer at different times are not always in agreement. It is probable, however, that when due precautions are taken to have all conditions identically the same the well-trained eye will obtain consistent results. To show the necessity for such precautions two points of physiological importance may be briefly touched upon. Suppose that two discs, coloured, say, red and blue, when viewed in a bright light, appear to the eye to be of the same intensity, the blue disc will appear to be brighter than the red when viewed in a less bright light. This phenomenon, which was first clearly described by Purkinje in 1825, is exemplified in the familiar fact that blue flowers are visible longer than red flowers in deepening twilight. In like manner the blue and violet end of a spectrum is more stimulating to the eye than the red end when the general luminosity is low, but at high luminosities the red gains relatively in brightness until it becomes more stimulating than the blue. Then, again, the condition of the eye must be taken into account. The judgment as to the relative intensities of two coloured discs will depend upon whether, previous to making the comparison, the eye has been resting in darkness or has been exposed to the influence of ordinary illumination. The eye adapts itself differently in darkness and in light, and it is found that the dark-adapted eye is more powerfully affected by the blue half of the spectrum, but to the light-adapted eye the yellow and red end is more stimulating. In short, the part of the spectrum which appears brightest to the eye shifts towards or from the violet end (1) as the general luminosity diminishes or increases, and (2) as the eye tends towards the dark-adapted state or towards the light-adapted state. It is evident, in fact, that in comparing the intensities of differently-coloured lights the eye supplies no criterion as to the relative amounts of energy in the rays. Physically the energy in a given ray of light depends on the square of the amplitudes of the vibrations. Physiologi-

cally the sensitiveness of the eye depends partly upon the wave-length of the light, so that there is no simple relation between apparent intensity and energy. It is the physiological factor which renders the photometric comparison of differently-coloured lights difficult and uncertain. A few of the methods for overcoming these difficulties will now be described.

An obvious method of making a photometric comparison between two lights of markedly different colour is to fill up the gap between them by means of a series of lights differing by small gradations of tint. The relative intensities of each contiguous pair may then be determined by any of the usual photometric methods, and a final comparison effected by calculation between the extremes. To facilitate the comparison of lights differing slightly in tint, A. M. Mayer designed a photometer in which the phenomenon of contrast colours was taken advantage of. The simplest experiment in contrast colours is made by an application of Rumford's photometric method to the comparison of the shadows cast by two flames, one of which gives a white light and the other, say, a red light. Each flame will illuminate the part of the screen on which the shadow due to the other falls, and we might expect the one shadow to appear white and the other red. But when the experiment is made the one appears a beautiful green while the other appears red. The usual explanation of this striking effect is that the doubly illuminated surface of the screen gives a false criterion for white, compared with which the really white but less bright shadow thrown by the red flame appears green. This explanation seems to be hardly sufficient, in view of the fact established by Mayer that the same contrast of colours is observed even when no "doubly illuminated" part of the screen can be seen by the eye of an observer quite unprepared for what is to be seen and quite ignorant of the arrangement of the apparatus. Mayer also describes some very beautiful contrast effects obtained by using as the one source of light the flash of an electric discharge (*Phil. Mag.*, Aug. 1893). Put generally, the phenomenon of contrast colours consists in this, that a strong colour tends to impart its complementary tint to a neutral tint placed in juxtaposition, and to have a corresponding effect upon a non-neutral tint of feeble hue. It is evident, then, that by juxtaposition of a strong colour we may appreciably alter the hue of a particular tint. This is the principle of the method devised by Mayer for bringing into a condition of *apparent* equality of tint two coloured surfaces which, when viewed without the presence of the strong colour which induces the contrast tint, appear of distinctly different hue. Under these conditions the surfaces can be compared photometrically with greatly increased certainty.

When the intensities of two differently-coloured lights differ considerably there is no difficulty in judging which is the stronger. By making the one light pass through a fairly large range of brightness we may easily assign limits outside which the intensities are undoubtedly different. After some experience these limits get closer; and many experimenters find it possible, by taking proper precautions, not only to effect a match, but to effect practically the same match time after time. According to Abney, whose memoirs on colour photometry (*Phil. Trans.*, 1886, 1892) form a most important contribution to the subject, the observer in making his judgment as to the equality of luminosity of two patches of colour placed side by side must not begin to think about it, but must let the eye act as unconsciously as possible. His method was to compare the coloured patch with white light given by a particular standard and cut down to the proper intensity by use of a rotating sector, which could be adjusted by means of a suit-

Contrast colours.

Colour photometry.

able mechanism while it was rotating. In this way the relative brightness of different parts of the spectrum was obtained, and thus a curve known as the luminosity curve (Fig. 2) was constructed. Wave-lengths were measured horizontally, and the height of the luminosity curve above any point represented the luminosity of the light of the corresponding wave-length. The comparison of luminosity curves obtained by normal eyes and by colour-blind eyes is of great interest and importance, and brings out very clearly certain fundamental differences between normal and abnormal vision. Abney has also given special attention to the manner in which the feeling of colour is lost when the light is cut down sufficiently in intensity. When, for example, the intensity of a beam of white light which has been drawn out into a spectrum is gradually diminished, the part of the spectrum which first loses its colour is the dark red, and the part which retains its colour longest is the orange. Next to the orange and yellow the green is most persistent. It is in accordance with these facts that the gray tints at early dawn gradually assume colour as the dawn brightens; yellow, orange, and blue flowers show in their true colours, while red flowers still remain black, and not till a certain brightness is reached do all the colours come out unmistakably in their appropriate tints. To express the matter in another way, a normal eye in feeble lights acts as an eye afflicted with red colour-blindness. A useful account of many of these colour phenomena is given in Sir W. de W. Abney's book on Colour Vision.

If two sources of light of different intensity or of different colour are presented to the eye in more or less rapid alternation, and if the rate of alternation can be adjusted at will, then for slow or moderate rates of alternation the eye will perceive a flickering, which disappears when the alternation becomes rapid enough. Thus a singing flame announces its intermittent character to the ear, but appears perfectly steady to the eye. If the sources of light are to begin with of different colour and intensity, and if we gradually diminish the intensity of the more intense, we shall find that the rate of alternation at which flickering just disappears gets less as the intensities approach equality. When the intensities are equal the rate of alternation for which the flickering ceases reaches its minimum. With any change in the intensity of either the flickering reappears, and can be got rid of only by increasing the rate of alternation. The phenomenon was noticed by Plateau and its true meaning pointed out by Helmholtz. Rood was, however, the first to show how the phenomenon of flickering could be utilized for purposes of photometry (see *Amer. Jour. Sci.*, 1893). Haycraft successfully employed what is at bottom the same principle in comparing the luminosities of different parts of the spectrum (*Journ. Physiol.* vol. xxi, 1897). The spectrum of an intermittent beam of light was viewed by the eye. Now intermission may be regarded as an alternation of light and darkness, and the brighter the light the more rapid must be the intermission for which flickering just disappears. Thus there will be a particular rate of intermission for which the less luminous red will appear quite steady, while the more luminous green, for example, will flicker. As the rate of intermission is increased the non-flickering part of the spectrum will increase, and ultimately a rate will be reached at which flickering will be visible in a very narrow strip of the spectrum. This narrow strip will indicate by its position the most luminous part of the spectrum.

By varying the rate of intermission and noting the points in the spectrum which for each rate of intermission separated the flickering from the non-flickering regions, Haycraft obtained very simply curves of luminosity for the whole spectrum. Some of

these are reproduced in Fig. 2. The abscissæ are wave-lengths, and the ordinates the rates of intermission. The three curves belong to experiments with different widths of slit, the lowest corresponding to the narrowest slit and the highest to the widest slit. Any point on a curve gives the rate of intermission at which light of the indicated wave-length just ceased to flicker. The letters along the axis of wave-lengths indicate the positions of the colours, blue, green, yellow, red. The curves show the nature of Purkinje's

Fig. 2.

phenomenon, the relative luminosity of the red increasing with increased brightness of the beam, and the point of maximum luminosity shifting towards the red end of the spectrum. The order of brightness is—

- In the lower curve, green, yellow, blue, red.
- In the middle ,, yellow, green, red, blue.
- In the upper ,, yellow, red, green, blue.

According to Rood's experiments, when a disc whose halves differ in tint but not in luminosity is rotated rather slowly, the eye of the observer sees no flickering such as is at once apparent when the halves differ slightly in luminosity. Rood has himself suggested various forms of photometer based on this principle. In his latest form (see *Amer. Jour. Sci.*, Sept. 1899) the differently-coloured beams of light which are to be compared photometrically are made to illuminate the two surfaces of a prism of paper or of plaster of Paris set facing the eye. Between the prism and the eye is placed a cylindrical concave lens, which can be set in oscillation by means of a motor in such a way that first the one illuminated surface of the prism and then the other is presented to the eye in sufficiently rapid alternation. The one source of light is kept fixed, while the other is moved about until the sensation of flicker disappears. From work with this form of instrument Rood concludes that "the accuracy attainable with the flicker photometer, as at present constructed, and using light of different colours almost spectral in hue, is about the same as with ordinary photometers using plain white light, or light of exactly the same colour." A simple form of flicker photometer has been constructed by Whitman (see *Physical Review*, vol. iii, 1895-96), and his conclusions as to its accuracy and convenience fully corroborate Rood's.

It appears that, when in the comparison of lights of different colour the flicker vanishes, the sensation of colour is greatly diminished, but increases markedly as soon as the balance is destroyed and the flicker reproduced. This suggests the possibility that the sensations of brightness and of colour are produced by different structures in the eye. It has long been recognized that the sensation of colour is much feebler when the retina is stimulated in regions removed from the yellow spot, which is also the part of the retina specially implicated in the production of clear vision. Another familiar fact is that the eye fails to appreciate colour when the luminosity is faint, as if a stronger stimulus were needed to affect the nerves which have to do with colour sensation than to affect those which have to do with luminosity. When a dark body is gradually heated up to a red heat, careful experiment shows that of the faint, colourless, unsteady radiation which is visible some time before the dull red glow begins to be seen, the eye seems unable to get a steady hold. When, with rising temperature, the body begins to emit the first dull red rays, the early fitful character of the luminosity quite disappears and the radiation becomes steady. Now there

are two well-known structures in the eye called the rods and cones; and it has been suggested by von Kries that of these the rods are involved in producing the sensation of brightness, the cones the sensation of colour (see Lummer, *Wied. Ann.* 62, 1897). If this be so, and if the rods are the more sensitive to feeble radiations, it is probable that they also respond more quickly to any particular stimulus. Hence the sensitiveness of the eye to flickering may depend ultimately on the rods, or at least on the structure that has to do with the luminosity sensation. Whatever truth there may be in this speculation, it is clear that flickering depends on the duration of the sensation after stimulation of the eye; and according to Ferry (*Am. Jour. Sci.*, 1892), the duration depends on the luminosity and not on the wave-length. See also a paper on persistence of vision by Allen (*Physical Review*, vol. xi., 1900), which contains important results bearing upon the theory of vision.

The spectrophotometer is an instrument which enables us to make photometric comparisons between the similarly-coloured portions of the spectra of two different sources of light. In the earlier forms the difficulty of getting the two spectra actually to touch along their contiguous margins—an important condition, greatly increasing the accuracy of the comparison—was overcome by special optical contrivances. In the more recent forms the principle embodied in Swan's double prism photometer has been successfully applied. By means of a simple modification in the form of the two prisms, Brace (see *Phil. Mag.*, Nov. 1899) makes the combined

Fig. 3.

prism serve to produce the spectra as well as to effect the desired comparison. The compound prism ABC (Fig. 3) is made up of two equal rectangular prisms ADB and ADC placed with their longer sides in contact, so that the whole forms an equilateral prism with three polished faces. Part of the interface AD is silvered, the silvering forming a narrow central strip running parallel to AD. Along the rest of the interface the two prisms are cemented together with Canada balsam or other material having as nearly as possible the same refractive index as the glass. Now suppose the two rays R S to enter symmetrically from opposite sides of the base of the compound prism as shown in the diagram. The ray R will pass through the prism except where the silver strip intercepts it, and will form a part of a spectrum visible to the eye placed at R'. To the same eye there will be visible the similarly-dispersed ray SS' reflected from the silvered surface. Thus two systems of incident parallel rays of white light will form on emergence two spectra with corresponding rays exactly parallel. The aim of the experimenter is to make the two spectra of equal intensity by a method which enables him to compare the original intensities of the sources. Now, in spectrophotometric work the relative intensities of the portions of the spectra being compared cannot conveniently be altered by varying the distances of the sources. Recourse is therefore generally had to one of the other methods already mentioned, such as the use of polarizing prisms or of rotating sectors. Under certain conditions Vierordt's method of allowing the two rays to pass through slits of different width leads to good results, but too great confidence cannot be placed upon it.

An important application of the spectrophotometer is to

measure the absorptive powers and extinction coefficients of transparent substances for the differently-coloured rays of light. In such measurements the one spectrum is kept as steady in intensity as possible, though no standard of light has as yet been devised to give a steadiness comparable with the delicacy of the best spectrophotometric measurements. By appropriate means the intensities of chosen corresponding parts of the two spectra are made equal—in other words, a match is established. Into the path of the rays of the second spectrum the absorbent substance is introduced, and a match is again established, and a measure of the loss of luminosity due to the interposition of the absorbent substance is obtained.

It is evident that if the successive parts of two spectra are compared photometrically, we may by a process of summation obtain a comparison of the total luminosities of the lights which form the spectra. This process is far too tedious to be of any practical value, but sufficiently accurate results may in certain cases be obtained by comparison of two or more particular parts of the spectra, for example, strips in the red, green, and blue. Similar in principle is the method suggested by Macé de Lepinay, who matches his lights by looking first through a red glass of a particular tint and then through a chosen green. If R and G represent the corresponding ratios of the intensities, the required comparison is calculated from the

formula $I = \frac{R}{1 + 0.208(1 - GR)}$. Crova, one of the earliest

workers in this subject, effects the photometric comparison of differently-coloured lights by matching those monochromatic rays from the two sources which have the same ratio of intensities as the whole collected rays that make up the lights. Careful experiment alone can determine this particular ray, but were it once ascertained for the various sources of light in use the method would have the merits of rapidity and accuracy sufficient for practical needs. Spectrophotometric observations are necessary to determine the position in the spectrum of the particular monochromatic ray, but when it has been determined, a coloured glass may be made which allows light in the neighbourhood of this ray to pass, and the photometric comparison may then be effected by looking through this glass.

Refraction and Dispersion.—The accurate determination of the refractive indices of various substances for rays of definite wave-length, and of the relative refrangibilities of different rays in particular substances, is of the utmost importance, not only in the construction of optical instruments of all kinds, but also in theoretic questions as to the nature of light and the interconnexion of æther and matter. In addition to the direct processes of making these determinations (see *Ency. Brit.* vol. xiv. pp. 590–92; and vol. xvii. pp. 800, 801), there are other processes, somewhat indirect but distinctly valuable and instructive. Some of these are based upon the phenomenon of total reflection, which occurs when a ray travelling in a given medium falls upon the boundary separating it from a less refractive medium at an angle of incidence greater than a particular **critical angle**, whose value depends upon the two refractive indices. The critical angle is such that its sine is equal to the ratio of the smaller to the greater refractive index. Hence any convenient method for determining accurately this critical angle will give at once the ratio of the refractive indices of the two substances for the particular kind of light used. Wollaston was the first to use this method, which has been developed by Terquem, Trannin, Kohlrausch, Pulfrich, and others. One arrangement, which is found to yield results of considerable accuracy, is to form an air cell bounded by two parallel plates of

glass of uniform thickness, cemented together at their edges by some material not acted upon by the liquid whose refractive index is to be measured. This cell is then set with the glass walls vertical in the liquid, which is contained in a vessel fitted with parallel glass sides. A beam of parallel rays is passed horizontally through the vessel, liquid, and air cell, and viewed in a telescope placed on the opposite side of the vessel. The air cell is first set so as to receive the rays nearly at right angles to the glass walls, and it is then slowly rotated until the beam as viewed through the telescope vanishes. Another position of vanishing is found by rotating the air cell in the opposite direction. The angle between these two positions can be measured with great accuracy, and is evidently double the value of the critical angle for the liquid and air, since the glass walls of the air cell with their parallel sides in no way affect the *directions* of the rays. When monochromatic light is used the vanishing of the transmitted beam takes place suddenly, so that the critical position of the air cell can be determined with great nicety. With white light the critical angle for the most refrangible rays is first reached; consequently the blue, green, yellow, and red rays are cut off in succession as the air cell is gradually rotated, so that the telescopic field changes first to yellow, then to orange, and lastly to red before disappearing entirely. In a similar way the refractive index of a solid may be determined by immersing it in a liquid of greater refractive power and of known refractive index.

Wollaston's original method has been embodied very skilfully by Pulfrich in his total-reflectometer. To the upper plane horizontal surface of a glass cube or cylinder with axis vertical is cemented a glass tube whose function is to hold the liquid under examination. A slightly converging beam of light is introduced through the wall of the tube so as to impinge at grazing incidence on the upper surface of the glass cube or cylinder, which behaves

Fig. 4.

optically as a right-angled prism (Fig. 4). The rays which suffer refraction at the glass surface will all pass through the glass below a certain line. It is obvious from the diagram that the angle of refraction of this boundary ray as it enters the glass is the critical angle for the glass and the liquid. Its sine therefore measures the ratio of the refractive indices of the liquid and glass. The ray, as it passes on, impinges on the vertical wall of the glass prism, and then emerges into the air, making an angle i with the horizontal. At this second surface the sine of the angle of incidence (within the glass) is equal to the cosine of the angle of refraction at the horizontal surface, that is, to the quantity

$$1 - (\mu/\mu')^2$$

where μ , μ' are the refractive indices of the liquid and glass respectively. Hence

$$\sin i = \mu' \sqrt{1 - (\mu/\mu')^2}$$

or

$$\mu'^2 - \mu^2 = \sin^2 i.$$

The angle i can be determined with great accuracy by means of a telescope suitably mounted and directed so as to receive the emerging ray. By first filling the tube with distilled water at a definite temperature, for which μ is known, we can measure μ' ; and then knowing μ' we can determine the value of μ for any liquid (and also for any solid) of less refractive power than the glass.

According to the wave theory of light (see *Ency. Brit.* vol. xiv. p. 605), the refractive index of any medium for any particular ray is inversely as the speed of propagation of the ray in the medium. Hence any method of determining directly or indirectly the speed of propagation will

also determine the refractive index. The direct measurement of the velocity of light is an operation involving the highest experimental skill in the use of elaborate and delicate apparatus, and practically we infer the value of the speed of propagation in any given case from our knowledge of the value of the refractive index. Nevertheless a very ingenious application of the principle of interference (*Id.* p. 606) has given us a remarkably delicate though indirect method of measuring slight alterations in the speed of propagation, and therefore corresponding slight changes of refractive power. To produce interference phenomena in light we must break up a given ray into two parts, and then bring them together again after the one has described a slightly longer path than the other, or, at any rate, taken a longer time to describe its path. By this means the one set of crests and troughs lags behind the other set with which it was originally coincident. In the fundamental experiments devised by Young and Fresnel, and in the historical form of experiment known as Newton's rings, the interfering pencils of light travel in general along paths of different length. In Jamin's interferential refractometer, on the other hand, the interference effects are produced by a relative retardation of the one ray, which is made to pass through a slightly denser medium than the other.

Two thick glass mirrors, exactly the same in all respects, are arranged, as shown in Fig. 5, so that their similar surfaces form the opposite sides of a parallelogram whose acute angle is 45° .

A ray of light (R) falling on the first mirror at an angle of 45° is partly reflected and partly refracted at the first surface. The refracted part, being reflected at the back of the mirror, emerges (in part) again into the air and pursues a path towards the second mirror parallel to the path pursued by the first reflected ray. These two rays falling on the second mirror suffer various reflections and refractions. It will be seen, however, from the diagram, that the part of the first reflected ray which enters the second

Fig. 5.

mirror and is reflected from its back, finally meets with that part of the second ray which is reflected from the first surface of the second mirror, and both proceed towards the eye of the observer at E. If the mirrors are exactly parallel, these two rays from the time of their separation to the time of their recombination will travel along paths of equal lengths, and since they have experienced the same reflections and refractions, although in different order, will be equally intense when they recombine. If, however, the mirrors are not quite parallel, then, as first observed by Brewster, the two rays will meet after pursuing slightly different lengths of path, and interference bands will be seen. By adjusting the one mirror until the interference bands disappear we get the mirrors accurately parallel. When this has been done let a thin plate (P) of glass or other transparent medium be set in the path of one of the rays. At once interference bands will come into view because of the retardation of the one ray. In like manner we may produce interference bands by introducing into the paths two exactly equal tubes with transparent ends and filled with liquids or gases differing slightly in density. The relative amount of retardation of the one ray is measured by means of a compensator, which retards the other ray by an equal amount so that the interference bands disappear. This is usually a glass plate or a combination of narrow prisms capable of being manipulated so that the thickness of the material traversed by the ray may be varied in a definite manner. With this apparatus Jamin measured the refractive indices of various gases, and of dry and moist air, and studied the change of the refractive index of water with pressure and temperature.

In Jamin's apparatus the two rays which produce interference are separated by a distance proportional to the thickness of the mirrors, and since there is a practical limit to this thickness, it is not possible to separate the two rays very far. In Michelson's form of refractometer this limitation is quite removed, and at the same time the experimenter is able to introduce any relative

Refractometry by interference.

retardation within wide limits, and so to observe interference phenomena corresponding to large differences of path. The essential parts of Michelson's instrument are shown in Fig. 6. P Q are two exactly similar glass plates set parallel to one another, and usually at an angle of 45° to the direction of the ray coming through the slit S. P is silvered on the back with a

Fig. 6.

semi-transparent film, so that the part of the ray reflected internally at this filmed surface is approximately of the same intensity as the part which passes through the film. The reflected ray, deflected through a right angle, falls perpendicularly on the plane mirror M, placed at a convenient distance, and is consequently sent back along the original course to the plate P. The transmitted ray is similarly received by a mirror N, which we shall suppose placed at the same distance as M from the point where the ray splits into two.

Since the reflected ray, as it goes and comes, passes twice through the plate P, the paths of the two rays from their point of separation to their point of meeting would not be of the same effective length unless the transmitted ray had also to pass twice through the same thickness of glass. This is the reason for the presence of the plate Q, which simply acts as a compensator. The two rays having thus travelled the same length of path, meet again at the silvered surface of the plate P, and experience once more reflections and refractions. To an eye placed at E there will be transmitted through P part of the ray originally reflected at A, and there will be reflected part of the ray originally transmitted through P. Thus the two rays SAMAE, SANAE, having described paths of equal length, will be in a condition to produce interference phenomena, which will become apparent if any slight alteration in either path is made. Since the one ray has suffered reflection within the denser medium, and the other suffered reflection within the rarer medium, the phases of all the component vibrations will differ by half a period. Darkness will be produced, the conditions being the same as those which give rise to the black spot in Newton's rings. Any slight to or fro motion of either mirror will make the paths travelled by the two rays unequal, and interference bands will come into view. To facilitate the adjustment and make the instrument an instrument of precision one of the mirrors is provided with a fine screw, by which it can be moved through known distances perpendicular to its face. After the paths have been adjusted to equality, which is accomplished by slowly moving the one mirror so as to produce a widening out and final disappearance of the interference bands obtained with monochromatic light, let a slight alteration be made in the density of the medium through which the one ray passes. At once the interference bands will come into view, but they may be made to disappear again by moving the one mirror through the proper distance. This distance is measured in terms of the number of rotations that must be given to the screw by means of which the slow motion of the mirror is effected. The retardation or acceleration of phase is thus accurately determined, with the corresponding change of velocity and density. The instrument has been applied by Michelson and others to a great variety of problems, some of which will be referred to later.

Of recent years a great deal of experimental work has been done in regard to the effect of changed physical conditions, such as pressure and temperature, on refraction and dispersion in transparent bodies. These effects are too small to have any practical influence upon the optical properties of telescopes and microscopes, but the results are of high importance from a theoretical point of view. The wave theory of light would lead us to expect that any increase in the density of a substance should cause a decrease in the speed of propagation of light through it—that is, an increase in the refractive index. Gladstone and Dale long ago established a simple empirical law connecting the refractive index of a substance and its density, namely,

that the refractive index diminished by unity is proportional to the density. The ratio of the two $(\mu - 1)/D$ is frequently called the molecular index, a name which is not, however, altogether satisfactory, since it suggests the rather crude theory that the molecules of a substance have a refractive index analogous to that possessed by the combined system of molecules which build up the substance. Laplace showed that the corpuscular theory of light required the density to be proportional to the excess of the square of the refractive index over unity, and more recently H. A. Lorentz and L. Lorenz have independently deduced from special forms of the wave theory the formula—

$$\frac{\mu^2 - 1}{\mu^2 + 1} \frac{1}{D} = \text{constant},$$

the investigations of the former being based upon Maxwell's electromagnetic theory of light. If we take a substance, say water, and measure the refractive indices at two different pressures, any one of the three expressions enables us to calculate theoretically the ratio of the densities. But these may be measured directly by a purely dynamic process. Hence by comparing the measured change of density with that calculated from the assumed optical relation, we may test the applicability of this relation. This has been done with great elaboration by Quincke for water, glycerine, rape oil, almond oil, olive oil, oil of turpentine, carbon bisulphide, petroleum, alcohol, ether, and other substances; and in all Gladstone's empirical formula gave most satisfactory agreement. Lorentz's formula has, however, a much wider applicability, for it alone gives the same value for a given substance whether that substance be in the liquid or in the gaseous state.

It has not been found possible to establish any simple law connecting temperature and refractive index. If it were a mere question of density, then we should expect the refractive index of water at 4° C. and (the temperature of the maximum density) to be a maximum also, but this it is not. According to Rühlmann, the refractive index of water decreases steadily as the temperature rises from 0° C., and shows no peculiarity at or near the maximum density point. Müller, Vogel, Offret, Arzruni, Dufet, and others have measured with great care the changes with temperature of the refractive indices of different kinds of glass and the more important crystals. In this direction one fact of a general nature seems to have been established by Pulfrich (*Wied. Ann.*, 1892). Working with several kinds of glass, rock-salt, quartz, and flint, he finds that the dispersion always increases with rise of temperature, in the cases in which the refractive index increases as well as in those in which it diminishes. In other words, when the refractive index increases with temperature, the change in the blue rays is greater than the change in the red rays, and when the refractive index diminishes with rise of temperature the change in the blue is less than in the red. As a general rule the dispersion in liquids and gases diminishes with rise of temperature. In seeking for an explanation of these differences Pulfrich points out that in all cases of change of temperature not only must the accompanying change of density be taken into account, but there is also a probable change in the absorptive power of the body. As will be discussed more fully below, in connexion with anomalous dispersion, there is a close relation between absorption and dispersion. To bring out more clearly the nature of the argument, let us take the case of heavy flint glass as given by Pulfrich. In the first row of the following table, under the letters C D F G', which represent the red, yellow, and blue rays corresponding to the so-named Fraunhofer lines in the solar spectrum, there are entered the observed rates of increase per degree centigrade

the refractive indices of the four rays. In the second line are given the calculated values of what these refractive indices would be according to Gladstone's law—in other words, the density effect. The third row contains the differences of the corresponding figures in the first and second rows, these being regarded as due to increase in absorptive power at the higher temperature. The increase of absorptive effect as we pass towards the more refrangible end of the spectrum is, according to the various theories of the inter-relation of absorption, refraction, and dispersion, in harmony with an increase of refraction increasing towards the violet end—that is, with an increased dispersion.

Increase per Degree of the Refractive Index.

	C.	D.	F.	G.
Observed value	+00001204	+00001447	+00002090	+00002810
Density effect, calculation	-2662	-2699	-2799	-2889
Absorption effect	+3866	-4146	+4889	+5699

In general, then, when a rise of temperature takes place, the refractive index is diminished because of diminution of density, but is increased because of increase of absorptive power. The net result will be decrease or increase, according as the former preponderates or is overbalanced. In cases in which the cubical dilatation is small, the probability is that the effect due to increase in absorptive power will preponderate; and this is the case in the glasses and crystals studied by Pulfrich. Later experiments by Reed (*Wied. Ann.* 65, 1898) bear out these conclusions. For example, the increase with temperature of dispersion in fluorspar is very small, a fact in agreement with the small absorbing power of this mineral, the blue and violet parts of the spectrum remaining sharp and distinct even to the highest temperatures. In the case of two kinds of glass experimented with, the dispersion increased only up to a certain limit, and began to decrease at high temperatures approaching the temperature at which softening set in.

The wave theory of light in its most elementary form shows that a very close connexion must exist between the refractive index and the speed of propagation, and although practically no refracted ray is considered as existing in the case of opaque substances such as metals, nevertheless there may be in these cases also a truly refracted ray penetrating a short but measurable distance into the material. The simplest proof of this fact is that metallic films can be obtained thin enough to be transparent. First, however, it is convenient to draw attention to a phenomenon first observed by Newton and described by Stokes in these words: "When Newton's rings are formed between the under surface of a prism and the upper surface of a lens, or of another prism with a slightly convex face, there is no difficulty in increasing the angle of incidence on the under surface of the first prism till it exceeds the critical angle. On viewing the rings formed in this manner, it is found that they disappear on passing the critical angle, but that the central black spot remains." In other words, the phenomenon of total reflection seems to be fundamentally modified when the layer of air behind the reflecting surface is very thin. The explanation is that the disturbance in the air layer which, under ordinary conditions, penetrates a fraction of a wave-length into the rarer medium, is able to be transmitted as a progressive disturbance into the medium on the other side when the air layer is excessively thin. What takes place in this comparatively simple case of total reflection at the boundary of two transparent media will certainly occur, but with more complex accompaniments, at the boundary of a trans-

parent medium and a highly absorbent and generally opaque metallic substance.

As already stated, metallic films when thin enough become transparent; and by direct measurements with thin metallic prisms of very acute angle Kundt obtained values of the refractive indices of the metals silver, gold, copper, platinum, iron, nickel, and bismuth, and also of some of their oxides. From these it appears that silver, gold, and copper are in general characterized by the possession of refractive indices less than unity, that there is very little dispersion in the case of silver, but that in the case of gold and copper the refractive index increases distinctly from the red to the blue end of the spectrum, becoming unity or very nearly unity for blue light. On the other hand, the refractive indices for the remaining four metals are greater than unity, and diminish in value as the wave-length of the incident light decreases. In other words, these four metals exhibit dispersion, but it is in the opposite direction to that exhibited by ordinary transparent media. Some of these results had already been indicated by indirect methods of testing the refractive powers of metal (see *Ency. Brit.* vol. xiv. p. 613). One of these methods may be briefly referred to. Brewster's law asserts that the tangent of the polarizing angle is equal to the refractive index of the reflecting surface. Now, although metallic surfaces do not possess a polarizing angle in the strict sense of the term, there is a certain angle of incidence for which the intensity of light polarized perpendicularly to the plane of incidence is a minimum. The circumstance that the angle is found to increase with the wave-length of the incident light suggests that the refractive index is greater for the red than for the blue ray. These indications become precise on the now universally adopted theory of metallic reflection, in which the speed of propagation is taken as a complex constant; and their most elaborate unification hitherto made has been in Drude's measurements of the optical constants of metals (*Wied. Ann.* 39, 1890). Experiment shows that if too thin films are used the optical properties and optical constants theoretically deducible from these become quite changed. This is, of course, not surprising. Whatever particular view be taken of the process of reflection of waves of light, the results of experiment will depend sensibly on the state of the transition layer, or on the presence of a thin layer of foreign matter, such as grease on the surface of water. According to Rayleigh's results, the deviation from theory would seem to be naturally accounted for by the effects of such tarnish, without the need of further assumptions.

The characteristic feature of metallic reflection is that it is selective. For example, gold leaf which has been beaten out so thin as to be transparent continues to retain its characteristic metallic lustre, but the light transmitted through it is green. Coloured glass, on the other hand, or the translucent petal of a flower, has the same colour, whether studied by means of reflected or transmitted light. In these and similar cases the light thrown back to the eye has been robbed by absorption of certain of its constituents, but in the case of metallic reflection the light that is thrown back contains rays which are not merely the residuum remaining after the absorption of their fellows, but have been selectively reflected before absorption has taken place. This selectively reflected light is but partially polarized by reflection; hence there is no true polarizing angle in the case of metallic reflecting surfaces, but only an angle for which a maximum polarization is obtained.

The property of "metallic reflection" is, however, not confined to metals only, and it was from a study of certain substances showing similar characteristics of what has been

Refractive index for metals.

Selective reflection.

called surface colour that Stokes was led to some conclusions of far-reaching importance. The aniline dyes are the most familiar of these non-metallic substances which exhibit metallic reflection. In such cases the metallic reflection is confined to rays of a limited range of colour and wave-length, each substance being moderately transparent to rays of other colours. For these rays of selectively reflected light there is no true polarizing angle, but at considerable angles of incidence the light polarized perpendicularly to the plane of incidence becomes usually of a richer colour in consequence of the removal in great measure of the rest of the reflected light. This portion of the reflected light may also be removed or greatly weakened by the substance being brought into optical contact with a transparent substance of nearly the same refractive index, the rays due to metallic reflection being thus more strongly brought out. For example, when safflower-red (carthamine) is deposited on glass by means of water, and the water is allowed to evaporate, the film obtained reflects a yellowish-green light from the surface in contact with air, but from the surface in contact with the glass a "fine green inclining to blue." Another substance studied by Stokes was crystallized permanganate of potash. When light reflected from a crystal at the polarizing angle is viewed through a Nicol prism, so placed as to extinguish the rays polarized in the plane of incidence, the appearance is green, and analysis by a prism shows five bright bands corresponding to the five dark bands in the spectrum of the light transmitted through a solution of the substance. When the Nicol is turned through a right angle so as to extinguish the rays polarized perpendicularly to the plane of incidence, the bright bands are hardly or not at all perceptible. In many cases the reflected light or surface colour and the transmitted light or substance colour of substances exhibiting metallic reflection are approximately complementary. For example, fuchsine transmits red and violet light and reflects green. As pointed out by Stokes, an accurate complementary relation between the reflected and transmitted lights could be looked for only in the case of excessively thin films of the substance.

Although in this article we are mainly concerned with the radiant energy which affects our organs of vision, it must not be forgotten that there are other rays which, though invisible, are physically identical in nature with the visible rays. It is important occasionally to refer to these as presenting characteristics fundamentally the same as those of light. Thus, with regard to these other rays—the dark heat or infra-red rays with longer wave-lengths than those of red light, and the invisible actinic or ultra-violet rays with wave-lengths shorter than those of violet—substances may be transparent or opaque, or may exhibit selective reflection. Rock-salt, glass, quartz, and fluor spar are all approximately equally transparent to ordinary light, but experiment shows that rock-salt is very transparent to the dark heat rays to which glass is powerfully opaque, and that quartz and fluor spar are remarkably transparent to the ultra-violet rays, a comparatively large fraction of the energy of which is absorbed by glass. Glass seems to behave towards certain of the infra-red rays as an intensely opaque substance, for, after the radiation has been cut down by passage through a thin glass plate, a second glass plate interposed has very little further effect. The principal absorption occurs at the first glass surface across which the radiations pass; here the glass becomes strongly heated, and becomes itself a radiator for heat rays of comparatively low intensity. It is possible, however, that some of the incident heat rays are reflected without evident absorption, just as in the case of metallic reflection for light. Selective reflection has not, so far, been estab-

lished for glass, but it has been observed in the case of certain transparent minerals, such as quartz, mica, sylvine, and fluorite. In the experiments of Rubens and E. F. Nichols the selectively reflected rays were isolated from the others by successive reflections from three or more surfaces of the material. By this process all the rays which do not suffer metallic reflection are diminished so greatly in their intensity as to be practically non-existent, while those which do are left in sufficient intensity to be measurable by means of a delicate thermoscope, such as a bolometer or radio-thermometer (see *Physical Review*, vols. iv. and v., 1896–97). They found that in quartz there are three narrow regions of metallic reflection, the maxima corresponding to wave-lengths 0.0085, 0.0090, and 0.0208 mm. These are also, of course, corresponding regions of apparent absorption in the transmitted radiations. The shortest wave-length of the three is about 11.2 times the wave-length of the light corresponding to Fraunhofer's line A in the dark red of the solar spectrum. In mica there are also three narrow regions of metallic reflection not far removed from those in quartz, and in fluorite (Rubens, *Wied. Ann.*, 1899) there are two regions of metallic reflection in the neighbourhood of rays of wave-lengths 0.0244 mm. and 0.032 mm. No evidence of metallic reflection was found in the case of rock-salt, crown glass, flint glass, sulphur, potassium, alum, shellac, and Iceland spar. If it exist it must be for radiations of wave-length greater than 0.025 mm., beyond which, under the conditions of the experiment, it was impossible to go. For these heat rays of long wave-length metal surfaces reflect perfectly, whereas for green rays of wave-length 0.0005 mm. the percentage of the incident light which suffers reflection varies from about 55 for copper to 88 for silver. By direct comparison with silver, Rubens and Nichols determined the percentage of reflection of these heat rays of long wave-length, from which, by the use of Fresnel's formula for reflection, the refractive indices for these rays could be calculated. In the case of rock-salt, sylvine, and chloride of silver the refraction could be studied directly by means of transmission through a prism.

The measurement of the refractive indices of transparent substances for rays of long wave-length is of great theoretic interest in its bearing on Clerk Maxwell's electromagnetic theory of light. According to this theory, light is an electromagnetic phenomenon, and one of the simplest relations required by the theory is the numerical identity of the specific inductive capacity of an insulating substance and the square of its refractive index for disturbances of long period. This particular refractive index cannot, of course, be determined directly, but we may gain some indication of its value from a knowledge of the refractive indices for rays of long wave-length in the neighbourhood of the lowest region of heavy absorption (see below, under *Anomalous Dispersion*). The result of the comparison is given in the adjoining table, in which the top row of figures gives the calculated values of the refractive indices of the different substances for rays of infinite wave-length, and the bottom the means of various determinations of the specific inductive capacity or dielectric constant.

Flint Glass.	Fluorite.	Quartz.	Rock-Salt.	Sylvine.
6.77	6.09	4.58	5.18	4.55
7.9	6.7	4.58	5.99	4.94

The remarkable agreement between the values for quartz, as compared with the corresponding values for the other substances, is explained by the fact that the positions of the chief absorption bands in the dark heat rays spectrum had been specially well determined, and is

Non-luminous rays.

Refractive index and dielectric constant.

evidence that there are no more in still lower regions. In his paper on the properties of quartz for rays of great wave-length, Nichols has given reasons for the conclusion that for wave-length 0.0074 mm. the refractive index of quartz becomes unity, and rapidly diminishes for longer wave-lengths until the value falls to 0.366 for wave-length 0.00805 mm., this result indicating the existence of a definite region of anomalous dispersion in the dark heat rays of long wave-length. Experimenting on the same lines Aschkinass has demonstrated the existence of regions of anomalous dispersion for infra-red rays in a number of substances, including quartz, mica, fluorite, gypsum, alum, sylvine, rock-salt (*Drude's Annalen*, i., 1900).

The broad fact of dispersion is that the differently-coloured rays of light suffer different refractions as they pass at oblique incidence from one transparent medium to another. If the wave theory of light be adopted, this fact means that the speed of propagation of a particular ray of light through a material medium depends upon the wave-length associated with that ray. With all approximately colourless transparent media, such as water, glass, quartz, &c., the refrangibility increases as the wave-length diminishes; this relation has consequently come to be regarded as the normal one. The fact that the character and amount of dispersion vary considerably as we pass from medium to medium, and have no necessary relation to the amount of refraction, is of the greatest practical importance in the construction of achromatic lenses (see *Ency. Brit.* vol. xiv. p. 595 and xvii. p. 804). Whatever form of the wave theory be adopted, whether the electromagnetic or the more purely elastic theory, the phenomena of refraction and dispersion must find their explanation in the discontinuity introduced into the æther by the presence of matter. There must be between the molecules of matter and the neighbouring portions of æther a mutual action of some kind, for only by such a supposition can we explain the phenomena of the emission and absorption by different substances of their characteristic rays, or the less prominent but very striking phenomena of fluorescence, surface colour, and anomalous dispersion.

Stokes has shown that some idea of the action of the mechanism involved in the phenomenon of fluorescence (*Ency. Brit.* vol. xiv. p. 602) may be obtained from the study of a comparatively simple vibrating system of particles acted on by a periodic disturbing force. If the period of the disturbing force be greater than the natural period of the system the disturbance is transmitted along the system and cannot accumulate at the point where the disturbing force is acting. If, on the other hand, the period of the disturbing force be less than the natural period of the system, the disturbance is not transmitted, but assumes a permanent form as a local agitation, and the system will continue to vibrate after the exciting disturbance has ceased, the quickest vibration being the natural period already mentioned. This illustrates the law that the light due to fluorescence is always of slower vibration and longer wave-length than the exciting light (see *Tait's Light*, pp. 161-163).

The experimental investigation into the nature of anomalous dispersion is associated mainly with the names of

Anomalous dispersion. Fox Talbot, Le Roux, Christiansen, and Kundt. The theoretical explanation is associated historically with the names of Rayleigh, Sellmeyer, Ketteler, and Helmholtz, although it now appears that the problem was first formulated and solved by Clerk Maxwell as early as 1869 (*Phil. Mag.*, 1900). The principle at the base of the explanation is that of resonance, the same principle, in fact, which Stokes first applied (about 1850) to explain the sodium absorption lines in the solar spectrum. The facts of spectrum analysis show that the molecules

of matter have natural periods of oscillation, and any vibratory motion isochronous with one of these natural periods of vibration is powerfully absorbed by the corresponding molecules. Hence, if one of the natural periods of molecular vibration is identical with that of a particular ray of light, the substance will behave towards this particular ray and towards rays of nearly the same period after a fashion quite distinct from that in which it behaves towards rays not approximately isochronous with it. The general result indicated by the dynamical theory in any of its adopted forms is as follows:—When a train of æthereal disturbances of period t is incident upon a region occupied by a connected group of particles having a period of free vibration t' , the speed of propagation of the disturbance through the connected particles is greatly decreased if t is slightly greater than t' , and greatly increased if t is slightly less than t' . When t and t' are equal there is almost complete reflection, so that in the transmitted light the ray of vibration period t will be almost entirely absorbed. That is to say, in the neighbourhood of an absorption band we may expect to find an increase of the refractive index immediately below the absorption band (*i.e.*, towards the red) and a decrease of the refractive index above the absorption band. Now this is exactly the law which Kundt established by experiment. The effect has been detected in the neighbourhood of the two conspicuous lines in the spectrum of sodium vapour, the lines which correspond in position with the double D of the solar spectrum. In this case, however, the effect is comparatively small; it is best observed in preparations of fuchsine and other aniline dyes whose absorption spectra are characterized by one or more broad and dark absorption bands. The most recent measurements of the optical constants of fuchsine are those of Pflüger (*Wied. Ann.* 56, 1895) and Bloch (*Journ. de Phys.* vii., 1898). The former worked with thin prisms of the material formed by evaporation of the alcohol from an alcoholic solution which had been dropped into the fine angle contained between a plane plate of glass and a small portion of a glass tube laid on it. His aim was to obtain direct measurements of deviations of rays passed through the semi-transparent substance. Bloch's aim, on the other hand, was to study the phenomenon of metallic reflection and absorption, and he prepared thin collodion films saturated with fuchsine. By means of interference bands he obtained some beautiful illustrations of the difference in the law of change of phase for reflection from transparent materials like glass and from surfaces showing metallic reflection. Thus, in the neighbourhood of the characteristic absorption band of fuchsine, the surface reflected in this respect like a metal, whereas towards the red and violet ends the reflection was of the ordinary vitreous character. Confining our attention more particularly to the phenomenon of anomalous dispersion, we may reproduce Pflüger's results for his fuchsine prisms.

The refractive indices were measured for eight well-known rays of definite wave-length, namely, the hydrogen lines h , and G , the strontium blue, the hydrogen F , the thallium green, the sodium D , the lithium red, and the darkest observable red (about wave-length 0.000671 mm.). The mean values obtained with four fuchsine prisms are given in the second row of the following table, the first row containing the wave-lengths of the corresponding rays, measured in millionths of a millimetre.

Wave-length,	410	434	461	486	535	589	671	703
Refractive index,	1.17	1.04	0.83	1.05	1.95	2.64	2.34	2.30

The absorption band extends from between the F and G lines in the blue to beyond the D line in the yellow, and in some of the prisms it was not possible to obtain measurements with the rays of wave-lengths intermediate to these extremes. The results are shown graphically in Fig. 7, from which at a glance will be seen the broad features of anomalous dispersion. Thus the refrangibility of the blue and violet light is less than that of red

and yellow. There is, in accordance with Kundt's law, a decrease of refractive index above the absorption band and an increase below the absorption band, the position of which in the diagram is shown by the thick line below the dispersion curve. An interesting feature is the measurement of a refractive index less than unity, just at the more refrangible

Fig. 7.

becoming less than unity in the case of bodies like metals which are powerfully absorptive was shown by Helmholtz to be a natural result of the dynamic theory of light. Pflüger investigated similarly a number of other substances, but of these Hofmann's violet was the only other one which gave a refractive index less than unity. He also described some beautiful colour phenomena obtained by reflecting light at various incidences from the surface of fuchsine in contact with glass. The layer of fuchsine was prepared by allowing a hot solution of it in alcohol to harden on to the surface of a strongly heated glass plate or prism. As the angle of incidence was increased the green surface colour obtained with smaller angles of incidence suddenly changed to the clear blue of the totally reflected rays at the higher angles of incidence.

As already pointed out, the explanation of anomalous dispersion depends upon the principle of resonance. For ordinary dispersion the first theory, that of Cauchy, depended simply on static discreteness of the medium; but Kelvin showed that the number of molecules per wavelength (10^8) is far too great to account for dispersion so intense as actually occurs. Thus a complete theory must from the start take into account not only the nature of the stresses acting between the different parts of the molecular and æthereal system—whether they be due to relative motion, as in the case of frictional forces, or to relative configuration—but also the free vibration periods of these parts. The conditions when written down in the form of a differential equation lead mathematically to certain conclusions which give a sufficient explanation of the facts of anomalous dispersion. Take as an example the mode of attack from the standpoint of the electromagnetic theory.

The fundamental assumption is that the disturbance which is propagated as light is an electric disturbance, or rather a series of electric waves of definite wave-lengths and periodic times. In any material medium the molecules or molecular groups respond in some way to the periodic electric force acting in their immediate neighbourhood. Whatever the precise character of this action, it can at all events be mentally imaged as producing a displacement of electric charge. We may form the concrete conception of atomic charges or ions, each individual charge being associated always with a definite molecular mass, or we may think of the electric displacement as occurring within the molecular group, but in such a manner as to involve movements of mass. The former conception is more easily grasped and is capable of simpler treatment. The problem may then be stated thus. As the train of waves passes, a periodic electromotive force acts upon each ion, which has a period of its own about its position of equilibrium. This assumption taken along with the general equations of the electromagnetic field (see ELECTRICITY: *Electric Waves*) leads to an expression for the refractive index of the form

$$\mu = \mu_0 + \frac{M_1}{\lambda^2 - \lambda_1^2} + \frac{M_2}{\lambda^2 - \lambda_2^2} + \frac{M_3}{\lambda^2 - \lambda_3^2} + \dots$$

where $\lambda_1, \lambda_2, \lambda_3, \dots$ are the wave-lengths which correspond in period to the times of free vibration of the different sets of ions, λ is the wave-length of the transmitted ray, and μ_0 and the M 's are constants to be determined by experiment, but depending ultimately upon the electrical properties of the medium. Through any range of values of λ which is included between two of the values $\lambda_1, \lambda_2, \lambda_3, \dots$, the dispersion is normal, and in the special case in which the values $\lambda_1, \lambda_2, \lambda_3, \dots$ are much smaller than λ the formula takes the form obtained by Cauchy. On

the other hand, when the range of values of λ includes one or more of the quantities $\lambda_1, \lambda_2, \lambda_3, \dots$ the dispersion becomes anomalous, for in this case the expression $M/(\lambda^2 - \lambda_i^2)$ changes abruptly from $+\infty$ to $-\infty$ as λ diminishes through the value λ_i . But physically the region in the neighbourhood of λ_i is a region of selective absorption. Hence, as we approach this region (supposed drawn out as a spectrum) from the side of longer wave-lengths the refractive index is abnormally increased, whereas if we approach from the side of shorter wave-lengths the refractive index is abnormally decreased. This is the law established experimentally by Kundt (see above).

Rotational Effects in Polarized Light.—The main characteristics of plane, circular, and elliptically polarized light are fully expounded in the *Ency. Brit.* vol. xiv. pp. 611–13, where the usual methods are described by which these peculiar conditions are obtained. Of special importance for our present purpose is the discussion of the purely kinematical process by which the vibrations which constitute two rays of plane polarized light combine under suitable conditions to produce in general elliptic polarization. It thus appears that both circular and plane polarization are limiting forms of elliptic polarization. For the co-ordination of many phenomena this kinematical view suffices, and without committing ourselves to any dynamic theory of the constitution of the æther we may assume the simplest conception of a transverse vibration of a simple harmonic type, and consider how far this assumption can lead us in discussing the various phenomena of what is called in somewhat elliptic language Rotatory Polarization. Under this term we group a variety of phenomena, the common feature of which is that the plane of polarization of a plane polarized ray is rotated when the ray is passed through a particular medium or reflected from a particular surface.

It was discovered by Arago in 1811 that when a plate of quartz cut perpendicularly to the optic axis is inserted between two crossed Nicols (that is, two Nicol prisms adjusted for complete extinction of light) a certain amount of light passes through. Should the plate of quartz be thick, say an inch or more, the transmitted light will not be changed appreciably in colour, but if it is thin enough an originally white beam of light will after transmission emerge coloured. The thinner the plate the more saturated the colour, which will change if either of the Nicols is rotated round the axis of the beam. The true nature of the phenomenon is at once demonstrated if instead of ordinary light we use homogeneous light, say, the yellow sodium light obtained by burning common salt in a spirit flame. Let the Nicols be adjusted for extinction and the quartz plate inserted between them. Then as before a certain amount of light will be transmitted, but there will be no change of colour. By rotation of either Nicol through an angle depending on the thickness of the quartz plate this yellow light will be extinguished. For example, with a quartz plate 1 mm. thick it will be necessary to rotate the one Nicol through an angle of about 21.7° before the light disappears. For plates of other thicknesses the required rotation is proportional to the thickness. The direction in which the second Nicol or analyser must be turned depends upon the kind of quartz, which may be either right-handed or left-handed in its rotational effect. The distinction is important, but the nomenclature is to some extent conventional. It is usual now to define right-handed quartz as that kind which produces rotation of the plane of polarization in the direction which is right-handed with reference to the direction of propagation of the ray.

This experiment shows that the plane of polarization of a plane polarized ray of homogeneous light which has been transmitted through a piece of quartz in a direction parallel to the optic axis of the crystal suffers a definite

rotation for every unit thickness travelled through. With the further experimental fact that the angle of rotation increases with the refrangibility of the light used we are able at once to understand the change of colour of the transmitted beam when white light is used. There is, in fact, a rotational dispersion of composite light. When a plane polarized beam of composite light is passed through the quartz plate the planes of polarization of the differently-coloured constituents are rotated through different angles. Let the emergent beam be viewed through a second Nicol which polarizes light in a plane making angle α with the plane of polarization of the light before it entered the quartz; and let θ be the angle of rotation produced by the quartz upon the plane of polarization of a particular constituent of intensity I , which we assume to be proportional to the square of the amplitude of the associated vibration. Then the intensity of this kind of light transmitted through the second Nicol will be $I \cos^2 (\alpha - \theta)$. Hence a greater proportion of the light of a given colour will pass the nearer $(\alpha - \theta)$ is to zero or to any multiple of two right angles. Consequently the prevailing tint will be determined by the rays for which $(\alpha - \theta)$ has the smallest value, or has values in the neighbourhood of even multiples of a right angle. As the second Nicol is rotated the prevailing tint will change, passing up the spectrum towards violet or down the spectrum towards red according to the direction of rotation. A beautiful and instructive method of making the experiment is to view the emerging beam through a spectroscope, the original beam having been passed through a narrow slit so as to obtain a fairly pure spectrum. When the quartz plate is inserted between the polarizer and analyser the spectrum will be seen crossed by a dark band, the centre of which marks by its position the particular coloured ray whose plane of polarization has been rotated so as to be perpendicular to the plane of polarization corresponding to the position of the second Nicol or analyser. If a thicker piece of quartz be used two or more bands may be seen, and if a very thick plate be interposed the spectrum will appear to be crossed by a large number of narrow bands.

In the following table for quartz (abridged from Winkelmann's *Physik*) the authority for the infra-red rays is Hessel, for the luminous and actinic rays Soret and Sarasin. The wave-lengths of the rays are given in the second column, and the rotations of the plane of polarization in the third:—

Ray in Solar Spectrum.	Wave-length 10^{-6} mm.	Rotation in Degrees.

Biot's law that the rotation is inversely as the square of the wave-length is only approximately true. Tait suggested a series of inverse even powers; and Pëddie showed (*Proc. R. S. E.*, 1882) that with three terms the rotation could be represented with great accuracy.

Similar rotatory power is possessed by other crystals, of

which may be mentioned cinnabar (32.5°), benzil (24.84°), hyposulphate of potash (8.39°), hyposulphate of lead (5.53°), chlorate of sodium (3.16°), and hyposulphate of calcium (2.09°). In these and similar cases the effect depends upon the crystalline arrangement of the molecules, for in amorphous conditions most of the substances lose their rotatory power. Thus fused quartz or quartz dissolved in potash has no rotatory effect on plane polarized light. Sulphate of strychnine and alum of amylinine are exceptions to this rule, being active in both the crystallized and fused condition. The rotatory power is, however, much feebler in the fused condition.

In remarkable contrast to the action of crystals is the action of certain solutions which cannot be regarded as being other than isotropic in mass, but which yet have the same power as quartz in rotating the plane of polarization of light passed through them. The effect is distinctly smaller than with quartz, but it occurs to equal degree in all possible directions through the solution. With quartz and most other rotatory crystals, on the other hand, the rotation is greatest when the light is transmitted along the optic axis, and is zero when the ray is passed perpendicular to the axis. Obviously the phenomenon in the case of solutions must depend upon the construction of the molecule, and Le Bel and van 't Hoff have connected it with the manner in which the carbon atom enters into combination with the other constituents of the molecule. The following table gives the rotation on red light produced by a few of these active substances, the thickness being one decimetre. The positive sign means right-handed rotation, and the negative left-handed.

	Rotation in liquids.
Essence of Seville orange	+78.94
„ citron	+55.3
„ lavender	+2.02
„ aniseed	-0.7
„ mint	-16.14
„ turpentine	-29.6
Solution of cane sugar, 50 per cent. in water	+33.64
„ quinine, 6 per cent. in alcohol	-30

In none of these cases does the rotation amount to 1° per millimetre thickness. For sufficiently dilute solutions the rotation is approximately proportional to the quantity of the active substance contained in unit volume.

If unit mass of the solution contains m grammes of the active substance, and s is the density of the solution, ms will be the density of the active substance in the solution. Let a thickness t of the solution produce a rotation τ , then the specific rotatory power is defined by the ratio τ/tms . What is known as the *molecular rotatory power* is obtained from this by multiplying by the molecular weight W of the dissolved substance and dividing by 100, or

$$\rho = \frac{W}{100} \cdot \frac{\tau}{tms}$$

In sugar solutions this quantity is approximately independent of the concentration. In no case, however, is it found to be absolutely constant, and in many cases it varies both with the concentration of the solution and with the nature of the solvent. Anomalous effects have also been obtained when two active substances have been mixed in one solution. In cane sugar solutions the specific rotatory power is about 66° for yellow light; in quartz it is 830° . According to Nasini, the specific rotatory power is especially great in solutions of santonin (202°), santonid (700°), and para-santonid (890°).

Various special forms of polarimeters, usually called saccharimeters, have been constructed to facilitate the measurement of the rotation in the case of sugar solutions, the method being one of great practical importance in sugar analysis. The end aimed at in all these instruments is to obtain an accurate determination of the position of the plane of polarization. A description of the ingenious combinations associated with the names of Stavart, Jellet, Laurent, Soleil, Wild, and others, will be found in books specially devoted to the subject of saccharimetry. There is, however, one important piece of apparatus, namely, the biquartz, which demands more than a passing mention. The biquartz consists of two semicircular discs of quartz placed in juxtaposition

so as to form one circular disc. Both are cut perpendicular to the axis and are of the same thickness, but they produce opposite rotations upon the plane of polarization of a given ray transmitted through them. The particular thickness chosen is that for which the plane of polarization of the brightest part of the spectrum, namely, the yellow, is turned through an angle of 90° . When such a biquartz is inserted between two parallel Nicols, this particular yellow light will be cut out by both halves of the biquartz, and the tint will be the same grayish violet all over the field of view. A slight rotation of the analysing Nicol in either direction will cause a change of tint in both halves of the field, but it will be a change towards blue in the one and towards red in the other. Thus the position in which the uniform tint is observed is determined with great precision, and we then know that the plane of polarization of the light incident on the biquartz is perpendicular to the principal plane of the analyser.

Fresnel's explanation of the rotation of the plane of polarization depends on the fact that a plane polarized ray of light may be decomposed into two circularly polarized rays polarized in opposite directions. Suppose, for example, that the aether vibration is taking place with simple harmonic motion along the line AOA' (Fig. 8), and that OP is the displacement at any instant. If we take O' so that $OO' = OP = \frac{1}{2}OA$, then OO' and $O'P$ will rotate at the same rate in opposite directions. O' will describe a circle about O , and P will describe an equal circle, but

in the opposite direction, about O' . These two circular motions combine to produce a resultant rectilinear motion along AA' . When a plane polarized ray falls perpendicularly upon the face of a disc of quartz cut perpendicular to the optic axis, the supposition is that the ray is decomposed into two circularly polarized components, polarized in opposite directions, and that these travel with different speeds through the quartz. If we follow in imagination the progress of the one circularly polarized ray and compare the *simultaneous* disturbances due to the two rays as they exist at any one place, we shall find that the difference in phase has changed by an amount which increases with the distance travelled. Consequently on emergence from the quartz the two circularly polarized rays which begin again to travel with the same speed will combine to form once more plane polarized light, but polarized in a plane which is displaced relatively to the original plane of polarization through an angle proportional to the thickness of the quartz plate. Thus if OO' and $O'P$ represent the combination that would have occurred had the two circularly polarized rays travelled with the same speed through the quartz, and if the angle $PO'Q$ is the relative phase retardation produced as explained above by the different speeds of propagation of the two rays, then on emergence the combination will be OO' and $O'Q$, and, since the corresponding circular motions will thereafter be propagated with the same speed, they will conspire to produce the rectilinear motion BOB' . The angle of rotation of the plane of polarization will evidently be $AOB = POQ = \frac{1}{2}PO'Q =$ half the relative phase retardation.

Fig. 8.

The peculiar action on which this explanation is based is the transmission through the crystal or other active substance of a circularly polarized ray with a speed which depends on the direction of rotation of the concomitant vibration. By a simple combination of quartz prisms, alternately right-handed and left-handed, Fresnel decomposed and dispersed a plane polarized ray into two parts which were found to be circularly polarized in opposite directions, thus demonstrating the real existence of the decomposition. The explanation given by Fresnel is of course purely kinematical, but in all more ultimate theories which strive to exhibit optical phenomena as a direct result of dynamical reasoning based on some plausible

assumptions as to the forces which act between aether and matter, the only simple wave trains that can be propagated without change are two circularly polarized ones. The modification is attained by introducing into the equations of motion forces which have a rotational effect. Airy and MacCullagh were the first to show how this might be done so as to co-ordinate the rotatory phenomena exhibited by quartz and solutions of active substances. To Airy also we owe the discussion of the remarkable phenomena of coloured rings and spirals, which are produced when polarized light is transmitted through quartz in a direction slightly inclined to the optic axis of the crystal. As the direction of transmission deviates from parallelism to the axis, Fresnel's circularly polarized components become elliptically polarized, the major axes of the two associated vibrations being at right angles to each other. Airy established the fact by direct experiment, and found that the ratio of the minor to the major axis rapidly diminishes as the deviation from parallelism to the optic axis increases. So rapid is this diminution that when the angle of deviation exceeds 10° the elliptic polarization can with difficulty be distinguished from plane polarization. To put it otherwise:—A circularly polarized ray is transmitted unchanged parallel to the optic axis, and a plane polarized ray is unchanged when transmitted perpendicular to the axis. For any other direction of transmission there are two particular elliptically polarized rays which are transmitted unchanged. These have the same ellipticity, which rapidly diminishes as the direction of transmission deviates from coincidence with the optic axis, they are polarized in opposite directions, and the major axes are perpendicular to each other. On these principles, and with the further assumption that the wave surface in quartz consists of a spherical sheet wholly surrounding a prolate spheroidal sheet, Airy very successfully co-ordinated the remarkable phenomena observed when a convergent beam of polarized light is passed through a plate of quartz cut perpendicularly to the axis and then viewed through a Nicol's prism. As an illustration of the nature of the phenomenon, take the case in which the quartz plate is interposed between two crossed Nicols, the transmitted beam being convergent. Coloured rings are at once observed, recalling at first glance the similar phenomenon when a doubly refracting but non-rotating crystal is used instead of the quartz (see *Ency. Brit.* vol. xiv. p. 613). But the central black cross is absent. At a considerable distance, however, from the centre, the colour of which is determined by the thickness of the plate, four faint brushes make their appearance intersecting the rings in the same directions as the black cross in Iceland spar. When the one Nicol is rotated a small cross begins to appear in the centre, the brushes get fainter, and the rings change form and colour, becoming approximately square when the Nicols are half way between the crossed and parallel positions. If the rotation is continued until the Nicols are parallel, the rings pass back into their circular form, while the brushes come out bright. When the incident light is circularly polarized the appearance is that of two spirals intertwined. Pocklington (*Phil. Mag.* vol. ii., 1901) has observed the spirals in crystals of sugar, a theoretical investigation based upon the electromagnetic theory of light having led him to look for such effects in bi-axial crystals of substances possessing rotatory power in the state of solution.

Airy's spirals.

No natural bi-axial crystal is known to possess the power of rotating the plane of polarization. It has, however, been shown, especially through the experiments of Reusch, that a pile of thin layers of mica suitably arranged over one another possesses optical properties

analogous to those of quartz. On the basis of these experiments Mallard has elaborated a theory of rotatory polarization applicable to crystals with one axis of geometric symmetry. When a plane polarized ray falls perpendicularly on a plate of mica, it is in general decomposed within the crystal into two components which travel with different speeds, and in consequence the emerging light is in general elliptically polarized. More generally, an elliptically polarized ray, passed through a very thin layer of mica, will emerge still elliptically polarized, but with the ellipticity and the azimuth of the major axis slightly altered. Suppose now that a pile is formed of a number of similar sheets of mica so arranged that the principal sections of each successive pair make with one another the same angle measured in the same sense as we pass through the pile. Also let the number of sheets be such that one more, if added according to the same rule, will have its principal sections parallel to those of the first. Under these conditions it is found that a ray of elliptically polarized light of the kind just described will after transmission through the pile continue as an elliptically polarized ray of practically the same ellipticity, but with the azimuth of the major axis rotated through an angle which increases with the number of sheets of mica. A plane polarized ray will emerge slightly elliptical, but the ellipticity will be less pronounced the thinner the sheets that make up the pile. According to this theory, quartz is to be regarded as built up of doubly refracting layers, none of which possesses individually the rotatory power, but which collectively do possess that power by virtue of an arrangement similar to the arrangement in Reusch's piles of mica sheets. This theory implies that no bi-axial crystal can produce rotatory polarization, for the arrangement required necessarily involves uni-axial symmetry. It is able to explain all the phenomena as they are found in quartz and similar crystals, but it fails of direct application to the case of cubical crystals, such as chlorate or sulpho-antimoniate of sodium, in which the rotatory effect is produced in all directions. For the same reason it is inapplicable to the case of solutions. Rotatory power may also be induced in a substance by subjecting it to a torsional strain. According to Ewell (*American Journal of Science*, vol. viii., 1899), the rotational effect in twisted glass and in gelatine is opposite to the twist.

Faraday's discovery in 1845 of the rotatory polarization associated with the magnetic field opened up a new line of research of deep theoretic importance. With the powerful magnetic fields now at our disposal there is no difficulty in repeating Faraday's experiment. Broadly stated, the general result is that when a ray of plane polarized light is transmitted through a substance set in a magnetic field codirectional with the ray, the plane of polarization is rotated by an amount which depends upon the nature of the substance, and which increases with the strength of the field and with the thickness of material passed through. The sense of the rotation is, with comparatively few exceptions, the same as the sense of revolution of the current which establishes the field—that is, it is right-handed with reference to the direction of magnetization. In this particular the law of the phenomenon is essentially different from that which holds in the case of quartz, sugar, and other naturally active substances. In these instances of rotatory polarization the sense of rotation is the same relatively to the direction of propagation of the ray; but in magnetic rotatory polarization the sense of rotation is determined by the direction of the magnetization. Thus, if the ray is by reflection at the one end made to pass to and fro

naturally active substances. In these instances of rotatory polarization the sense of rotation is the same relatively to the direction of propagation of the ray; but in magnetic rotatory polarization the sense of rotation is determined by the direction of the magnetization. Thus, if the ray is by reflection at the one end made to pass to and fro along the active medium so as to emerge at the end

through which it entered, there is no final change in the position of the plane of polarization when the substance is one that possesses the rotatory power naturally; but when, on the other hand, the effect is due to magnetization, the plane of polarization of the doubly transmitted ray is rotated through double the angle through which it is rotated by single transmission through the magnetized substance. The phenomenon may be explained along the lines of Fresnel's hypothesis as due to a difference in the speeds of propagation in a magnetic field of two circularly polarized rays polarized in opposite directions. As a rule the greater speed is possessed by the circularly polarized ray whose associated vibration is executed in the same sense as the helical current that establishes the field. Righi has experimentally demonstrated the existence of double refraction of circularly polarized light in a magnetized medium. The most powerful rotational effects per unit thickness of material have been obtained, as might have been expected, from thin transparent films of iron, nickel, and cobalt, the three ferromagnetic metals. Kundt estimates the rotation per millimetre in strongly magnetized iron to be 20,900°, and du Bois finds for nickel and cobalt the corresponding numbers 19,800° and 8900°. Another peculiarity in connexion with these metals is that the rotation is greater for red rays than for blue rays—in other words, the dispersion is “anomalous.”

Rotational effects are also produced, as was first shown by Kerr, when polarized light is reflected from the surface of these metals strongly magnetized. Even under the most favourable conditions the rotation is small and difficult to observe. The sense and amount of rotation depend upon the relation of the magnetization to the aspect of the reflecting surface and to the angle of incidence of the ray, and upon the relation of the plane of polarization to the plane of incidence. In these experiments the effect is not a simple rotation of the plane of polarization, for a certain amount of elliptic polarization is produced even in the cases in which the plane of polarization is either perpendicular or parallel to the plane of incidence. The full discussion of the results belongs rather to magnetism than to light. The phenomena of the magnetic rotatory polarization of light are of great theoretic importance, forming as they do a strong argument in favour of Maxwell's theory that light is an electromagnetic phenomenon.

The Kerr effect.

In the original form of the electromagnetic theory of light, as it left Maxwell's hands, no explanation was afforded of dispersion, regular, anomalous, or rotatory. To take account of these phenomena it has been found expedient to introduce permanently charged molecules of matter, the so-called ions. A certain number of these are conceived as existing in every body, and as subject to vibratory and translational motions. Since such a moving charge of electricity will be influenced by a magnetic field, it is not difficult to see that the propagation of an electromagnetic disturbance like light may influence and be influenced by the presence of the moving ions. Worked out along these lines, the electromagnetic theory of light has, in the hands of Helmholtz and others, led to formulæ broadly similar to the formulæ obtained on the elastic solid theory by taking into account the vibrations of the molecules.

In his *Lehrbuch der Optik* (1900) Drude assigns on theoretical grounds a formula for the rotatory dispersion of quartz, namely,

$$\bar{d} = \frac{k_1}{\lambda^2 - \lambda_1^2} + \frac{k'}{\lambda^2},$$

where λ is the wave-length of the transmitted ray, λ_1 the wave-length of the light whose period of vibration is equal to the period of the ions of a particular class, corresponding to which k_1 is the dispersion constant. The constant k'

is the dispersion constant associated with groups of ions whose vibration period is too slow to be comparable with the vibration period of any ray within the range of wave-lengths contemplated. When the value chosen for λ_1 is that which has been found from experiments on prismatic dispersion, the formula just given represents very satisfactorily the observed rotations. This is shown in the following table, condensed from Drude, λ_1^2 being equal to 10,627, and the constants having the values $k = 12,200,000$, $k' = 5,046,000$:—

Wave-length.	Dispersion.	
	Observed.	Calculated.
2140	1·60	1·57
1450	3·43	3·43
670·8	16·54	16·56

In 1896 Zeeman discovered that the spectral lines emitted by a flame charged with sodium vapour are altered when the flame is placed in a strong magnetic field. The effect as first observed was that the lines became broader; but improved experimental means have shown that the effect is essentially a triplication or even higher multiplication of each line. The triplication is evident when the luminous source is viewed at right angles to the direction of the magnetic force acting on it, and in such a case the central line is polarized at right angles to the magnetic field, while the outer lines have their plane of polarization parallel to the magnetic field. Duplication only is seen when the light is viewed along the direction of the magnetic field, and the two lines so observed belong to rays of light circularly polarized in opposite directions. These are the main facts, but there are various modifications determined by the nature of the radiating substance. The amount of separation between the limiting lines produced by triplication or multiplication of each originally single line of the spectrum of any one substance (e.g., cadmium) depends upon the wave-length as well as upon the strength of the magnetic field (Preston, *Phil. Mag.* vol. xiv., 1898). The general explanation of the phenomenon follows at once from Maxwell's electromagnetic theory of light, taken in conjunction with the obvious hypothesis, that in the molecules whose vibrations are the source of the radiations there are electrical vibrations which will respond to a magnetic force brought to bear upon them. Taking the simplest hypothesis as to the constitution of the ions, we may consider one of these to be describing a small orbit about a position of equilibrium, and subject to a force directly as the distance from this position. If no extraneous force be in action, this orbit will be an ellipse described in a definite period, which will correspond to the period of one of the rays emitted. When a magnetic force is brought into action the ion will be acted upon by a force perpendicular both to the magnetic force and to the direction of motion of the ion, and proportional to the strength of the magnetic force and the speed of the ion conjointly. These conditions lead mathematically to the approximate result that the vibration period will be tripled. This very simple case cannot, of course, be expected to apply generally, but it indicates the character of the perturbation produced by the magnetic force upon the orbital motion of the ions, or whatever corresponds to them, in the electrical constitution of the radiating body. Corresponding changes are observed in the absorption spectra of gases subjected to a strong magnetic field. Theoretic considerations led Tait and others to look for such an effect, with less powerful instruments, many years ago (*Proc. Roy. Soc. Edin.*, 1876).

Relative Motion of Matter and Æther.—The phenomenon of aberration of light depends (*Ency. Brit.* vol. xiv. p. 584) upon the ratio of the earth's orbital speed to the speed of propagation of light as it enters the eye of the observer. The direction of propagation of a ray in an isotropic medium, such as we believe the æther to be, is at right angles to the wave-front, and to an observer passing through the æther parallel to this wave-front, the apparent direction of the ray will be deflected forwards in the direction of the observer's motion. The simplest assumption is that the earth moves through a quiescent æther. According to the view which regards the æther as transmitting vibrations like an elastic solid—a view which for present purposes may be taken as including Fresnel's theory—the speed of propagation is inversely as the square root of the density. If V is the speed of light in free æther, of which we take the density as unity, and if V' is the speed of light in a transparent material medium such as glass or water, that is, in æther loaded with matter so that its effective density as a transmitter of elastic vibration is D , then we have $(V/V')^2 = D/1$. Or, since V/V' measures the refractive index n , we find $D = n^2$. In words, the effective density of æther is increased by the presence of matter in the ratio of the square of the refractive index to unity. What is the mechanism of this increase? Is the æther really condensed, so that unit volume contains more of it within a region occupied by matter, or is the greater effective density the result of the entanglement of matter and æther, the former exerting a drag upon any motions that may exist in the latter? Both of these views can be made consistent with the hypothesis of a quiescent æther outside the material substance, which the fact of aberration seems to demand. Now, experiment shows that the laws of reflection and refraction of light at and across the boundary of a transparent body moving with the earth, and therefore moving relatively to the æther outside it, are exactly the same as if there were no relative motion. The simplest explanation of this fact would, of course, be that the æther is partaking of the earth's motion—is, in short, at rest relatively to the earth. But this contradicts the hypothesis suggested by the fact of aberration. Fresnel showed, however, that it was possible to keep the hypothesis of the quiescent æther, and yet satisfy the condition that reflection and refraction take place as if there were no relative motion of matter and æther. The nature of the argument may be indicated by taking a simple example. Suppose a ray of light (Fig. 9) to be passing through a transparent slab, which is moving parallel to itself with speed v , and suppose the observer to be moving with the slab. This is the same thing as if the slab were at rest and the æther moving with an equal but opposite velocity. For simplicity of calculation we may take the thickness of the slab to be measured by the quantity $V' (= V/\mu)$, the speed of light in the slab when there is no relative motion of the slab and the æther. Let V be the speed of light in free æther, and let v' be the speed of the æther itself within the substance, v being its speed outside. Take the point A at a distance V from the slab, and consider the path of a ray of light moving through the æther in a direction perpendicular to the velocity v . The ray will travel along AB, which makes with the normal to the surface a small angle whose tangent is v/V .

Speed of light in moving medium.

Fig. 9.

Its future course will be along BC, which makes with the normal an angle whose tangent is v/V . These angles are very small, and to this order of small quantity there is no experimental evidence of a change of the law of refraction due to relative motion of matter and æther. Consequently the ratio of the sines of the angles of incidence and refraction is equal to the refractive index, or

$$\frac{v/v'}{V/V'} = \mu = \frac{V}{V'}, \text{ whence } v = \mu^2 v'.$$

Now superpose upon the system a velocity v in the direction in which the slab was originally regarded as moving. This reduces the æther to rest, but the velocity of light through the moving slab is increased by an amount equal to $(1 - \mu^{-2})v$ in the direction of the velocity v of the slab. We may follow Fresnel and speak of this as indicating a drag of æther with the body, but that view is not a necessity. There is no difficulty in conceiving the possibility of the speed of propagation of a disturbance in æther being influenced by the action of matter through it. Poincaré in his *Théorie mathématique de la lumière*, vol. i. chap. viii., has shown how this may occur. Larmor has more recently discussed the problem on the basis of the electromagnetic theory of light (see *Æther and Matter*, 1900), and has obtained Fresnel's expression on the assumption that there is a material polarization current depending partly on the motion of the substance, together with an æthereal displacement current depending on strain in a fixed æther. (See *ÆTHER*.)

The accuracy of Fresnel's expression was proved experimentally by Fizeau, who found that the velocity of light was accelerated in running water, but that the amount of increase fell short of the velocity of the water. The interference method used was that described in the *Ency. Brit.* vol. xiv. p. 607. The experiment has been repeated in an improved form by Michelson, who finds that the fraction of the velocity of the water by which the velocity of light is increased is 0.434 with a possible error of ± 0.02 . The value according to Fresnel's expression is $(1 - \mu^{-2})$ or 0.437.

Direct experiments have been made to determine whether any real drag of æther takes place when matter moves swiftly through it. Lodge (*Phil. Trans.* vol. clxxxiv., 1893) studied the behaviour of a beam of light which was divided into two portions by a semi-transparent mirror as in Michelson's interferometer, these portions being made to travel by means of suitable reflections along equal paths, but in opposite directions, several times round the circumferential region enclosed between two large parallel steel discs which could be set in rapid rotation. Any appreciable drag of the æther in this narrow region between the discs would declare itself by an interference effect due to the one half of the original beam being accelerated with respect to the other. The result was negative, there being no appreciable drag of æther in the neighbourhood of small bodies in rapid motion near the earth. Zehnder (*Wied. Ann.* Bd. lv., 1895) attempted to obtain a variation in the density of the æther by the rapid to-and-fro motion of a piston in a chamber from which the air had been removed. To detect this possible variation an interference method was used. The result was negative. In these experiments, and others of a similar character, the sensitiveness is not sufficient unless the effect looked for depends on the first order of small quantities, those namely of the order v/V , and the hypothesis of a quiescent æther, which the fact of aberration seems to require, can be brought into harmony with these negative results by taking into account the one other positive result verified by Fizeau and Michelson as to the acceleration of the velocity of light in a

moving medium. A further important step was taken in this inquiry when Michelson and Morley (*Amer. Jour. of Sci.* vol. xxxi., 1886, vol. cliii., 1897; *Phil. Mag.*, 1887) devised a method by which, on the assumption of a quiescent æther, an effect depending on quantities of the order $(v/V)^2$ would be appreciable.

The principle of the experiment is to study the interference changes produced in the instrument sketched in Fig. 6, as it is moved into different orientations. This will make the assumed relative motion of the earth and the æther affect differently the rays travelling along AM and AN. Let there be a drift of æther of velocity v in the direction AM. Then the ray from S which passes through P is reflected at N, and finally reflected at P will pursue a path SANBÉ (Fig. 10), and the ray that interferes with it will pursue the path SAMBE. The speed of the first ray is $\sqrt{V^2 + v^2}$, and the distance travelled is ANB or 2D, where D

Fig. 10.

Hence the time for the ray to travel over the path ANB is $2D/\sqrt{V^2 + v^2}$. The ray AMB travels with speed $V + v$ along AM $(= D + D\frac{v}{V})$, and with speed $V - v$ along MB $(= D - D\frac{v}{V})$. Hence the time taken to travel over the whole course is simply $2D/V$. The difference of these two times will give the time retardation of the one ray with respect to the other. The value to a first approximation is

$$\frac{2D}{V} \left\{ 1 - \left(1 + \frac{v^2}{V^2} \right)^{-\frac{1}{2}} \right\} = \frac{2D}{V} \left\{ 1 - 1 + \frac{v^2}{2V^2} \right\} = \frac{D}{V} \frac{v^2}{V^2}.$$

Now superpose the velocity $-v$ upon the whole system so as to reduce the æther to rest and set the apparatus in motion through the æther. Then the two paths will differ in length by the product of V and the time retardation, that is, by $D\frac{v^2}{V^2}$. While this motion through the æther is continuing, let the apparatus be rotated through a right angle, so that the path which was the longer in the first position now becomes the shorter. Then as the apparatus moves from the one orientation to the other there will occur a shift of the interference bands corresponding to a change $2D\frac{v^2}{V^2}$ in the length of one path relative to the other. The ratio v^2/V^2 is about 10^{-8} if we take v to be the earth's orbital velocity, and a wave-length of yellow light is 60×10^{-8} metres. Hence the interference fringes will be displaced by an amount which will bear to the width of the fringe the ratio $2D/60$. In Michelson's second arrangement the distance D was multiplied by a series of reflections from sets of parallel mirrors until it was equal to about 11 metres, giving a displacement of nearly 0.4 of a fringe. When all precautions were taken in carrying out this excessively difficult experiment, there was not the slightest indication of a displacement of the fringes as the apparatus was steadily veered round into different orientations. The simplest explanation is that the æther in the vicinity of the earth moves with it, a conclusion which seems to be inconsistent with the fact of aberration. In other words, the hypothesis of the quiescent æther is inconsistent with Michelson's and Morley's experiment unless there be some compensating cause not taken into account. Fitzgerald and Lorentz have pointed out that a slight change in the dimensions of a body due to its motion through space would meet all difficulties.

If we consider Michelson and Morley's experiment to prove that the earth and the æther near it have the same motion, then the phenomenon of aberration requires an explanation. Stokes as early as 1845 pointed out how one might be given by supposing the motion of the æther generated by the motion through it of the earth and other cosmical bodies to be of the kind known in hydrodynamics as irrotational. As Stokes himself recognized, there are

grave physical difficulties in giving this theory all-round consistency. Such difficulties, however, must almost certainly arise in any incomplete theory of the constitution of the aether; and there can be little doubt that no theory can be complete which does not take into account electrical and magnetic phenomena. (See *ÆTHER*.)

The literature of light and optics has grown enormously within recent years, chiefly in the form of scattered memoirs. Of English treatises may be mentioned PRESTON'S *Theory of Light* (2nd ed., 1895); BASSER'S *Treatise on Physical Optics*, 1892; and HEATH'S *Geometrical Optics*. LARMOR'S *Æther and Matter* (1900) is an important discussion of the inter-relations of matter and aether, and DRUDE'S *Lehrbuch der Optik* (1900) is the most complete work we have in which the physical side of the subject is treated consistently throughout from the standpoint of the electromagnetic theory.

(C. G. K.)

Lightfoot, Joseph Barber (1828-1889), English theologian and bishop of Durham, was born at Liverpool on 13th April 1828. His father was a Liverpool accountant. He was educated at King Edward's School, Birmingham, under Dr James Prince Lee, afterwards bishop of Manchester, a great schoolmaster, who had under him, at the same time with Lightfoot, not only Westcott, Lightfoot's successor at Durham, but Benson, afterwards archbishop of Canterbury. In 1847 Lightfoot went up to Trinity College, Cambridge, and there read for his degree with Westcott, who had preceded him thither. He took a brilliant degree, being senior classic and 30th wrangler, and was elected a fellow of his college. In 1857 he became tutor. His fame as a scholar grew rapidly. He was made Hulsean professor in 1860, and shortly afterwards, in rapid succession, chaplain to the Prince Consort and honorary chaplain in ordinary to the Queen. In 1866 he was Whitehall preacher, and in 1871 he became canon of St Paul's. His sermons were not remarkable for eloquence, but a certain solidity and balance of judgment, an absence of partisanship, a sobriety of expression combined with clearness and force of diction, attracted hearers and inspired them with confidence. As was written of him in *The Times* after his death, "his personal character carried immense weight, but his great position depended still more on the universally recognized fact that his belief in Christian truth and his defence of it were supported by learning as solid and comprehensive as could be found anywhere in Europe, and by a temper not only of the utmost candour but of the highest scientific capacity. The days in which his University influence was asserted were a time of much shaking of old beliefs. The disintegrating speculations of an influential school of criticism in Germany were making their way among English men of culture just about the time, as is usually the case, when the tide was turning against them in their own country. It was quite impossible, however, to assume that the verdict of real learning was on the side of the Tübingen school, when such a scholar as Dr Lightfoot, supported by his friend Dr Westcott, was convinced that it was on the side of the old beliefs. The peculiar service which was rendered at this juncture by the 'Cambridge School' was that, instead of opposing a mere dogmatic opposition to the Tübingen critics, they met them frankly on their own ground; and instead of arguing that their conclusions ought not to be and could not be true, they simply proved that their facts and their premisses were wrong. It was a characteristic of equal importance that Dr Lightfoot, like Dr Westcott, never discussed these subjects in the mere spirit of controversy. It was always patent that what he was chiefly concerned with was the substance and the life of Christian truth, and that his whole energies were employed in this inquiry because his whole heart was engaged in the truths and facts which were at stake. He was not diverted by controversy to

side-issues; and his labour was devoted to the positive elucidation of the sacred documents in which the Christian truth is enshrined."
